safely ascribed to Jan. A charming little Madonna (1432), characteristic of his early work, is at Ince Hall, near Liverpool. The National Gallery (London) has three good portraits—an unknown man (1432), called the "Scholar"; the "Man with a Turban" (1433), supposed to be Jan van Eyck himself; and the newly married "Giovanni Arnolfini and his Wife," a wonderful piece of realism. At Paris there are "Madonna with the Child," in the Rothschild collection, and the "Madonna of the Chancellor Rollin," in the Louvre. The Antwerp Museum possesses "St. Barbara" (1439), while Bruges has the powerful "Madonna of Canon George van der Pael" (1436) and the portrait of "The Artist's Wife" (1439). In Vienna are the portraits of Nicolas Albergati, Cardinal of Santa Croce (1432), and Jan de Leeuw (1436), and at Frankfurt is a delightful "Madonna Suckling the Child" of the early period. At Dresden there is a small triptych, which, according to the legend, was used by Charles V on his travels. The central panel shows the Madonna in a beautiful Gothic chapel; on one wing are "St. Michael and the Donor," on the other "St. Catharine." St. Petersburg possesses an "Annunciation," a "Crucifixion," and a "Last Judgment." The Berlin Museum is richest of all in works of Jan van Eyck. Besides the parts of the Ghent altar, and other works of more doubtful authenticity, it possesses the portraits of an "Esquire of the Order of St. Anthony," "Giovanni Arnolfini," and a "Knight of the Golden Fleece." In the Metropolitan Museum, New York, is a head of Thomas à Becket (Morgan collection), besides a school piece (the "Virgin and Child"), while the Johnson collection, Philadelphia, possesses "St. Francis Receiving the Stigmata"—one of the artist's finest portraits.

A prominent characteristic of Jan van Eyck's panels is their detailed finish, almost like the miniatures of a manuscript. They are like exquisitely wrought jewels. Such detail, of course, precludes emphasis, which is only in part atoned for by beauty and delicacy. His realism, as evinced in such figures as "Adam" and "Eve," must have been a revelation to contemporaries. His landscapes are well selected and, like his interiors, form admirable backgrounds for his pictures, giving unity to the composition. He did not understand linear perspective, but rendered atmospheric gradations with great skill and understood to a remarkable degree the handling of light and shade. Most charming of all is his color—bright, but in a low key, and pervaded by reddish-brown tone, full of light. He was, moreover, an excellent draftsman. Although the influence of his art was unbounded—extending through Germany, France, Spain, and southern Italy—Jan van Eyck never founded a school in the strict sense of the term.

Bibliography. The documentary evidence on the life of the Van Eyck brothers has been collected from the archives of Ghent and Bruges, published by Weale, and utilized in his *John and Hubert van Eyck* (London, 1908; 1912). The best critical discussion of their art is the lengthy account by Professor Dvořák, "Das Rätsel der Kunst der Brüder van Eyck," in *Jahrbuch kunsthistorischen Sammlungen* (Vienna, 1903). Other good monographs are by Kämmerer, in Knackfuss, *Künstler Monographien* (Bielefeld, 1898); Hyman (Paris, 1908); Durand-Gréville (Brussels, 1910). Consult also Lalaing, *Jean van Eyck* (Lille, 1887), and Voll,

Die altniederländische Malerei von van Eyck bis Memling (Leipzig, 1906).

EYDE, SAMUEL (1866-). A Norwegian electrochemist, engineer, inventor, and manufacturer, born at Arendal. He studied for his profession in Norway and Berlin, where he obtained his doctor's degree, and practiced engineering in Germany, Sweden, and Norway. Realizing that the soils of nations greatly needed fertilization, he and Prof. Kristian Birkeland of the University of Christiania conceived the idea of producing fertilizers from the air (azote or nitrogen) and limestone by electricity. After much labor they succeeded in the invention and (1903) began manufacturing with a 5 horsepower motor and three men. Nine years later (1912), Dr. Eyde owned three waterfalls, producing a total of 200,000 horse power, a factory employing 400 chemists, engineers, etc., and 1340 laborers, producing 2000 barrels of Norway saltpetre a day. In 1914 Dr. Eyde had secured another waterfall and built another factory using 200,000 horse power, giving his plants a capacity of 400,000 horse power. Still another 150,000 horse power he reserved. The plants represented a capital of 100,000,000 crowns, and around them the three towns—Notodden, Saaheim, and Eydehavn, where high explosives are also manufactured—had sprung up as results of the industry.

EYE (AS. *ēage*, Goth. *augō*, OHG. *ouga*, Ger. *Auge*, Icel. *auga*, OSw. *ouga*, Sw. *öga*, Dan. Nor. *öie*, Lat. *oculus*, eye, Gk. *ὄσος*, *osse*, the two eyes, OChurch Slav. *oko*, Skt. *aksan*, eye). The organ of sight. In this article we shall consider the structure of the human eyeball, and of certain accessory parts or appendages which serve to protect that organ and are essential to the due performance of its functions.

The *globe of the eye* is placed in the anterior part of the cavity of the orbit, in which it is held in position by its connection with the optic nerve posteriorly, and with the muscles which surround it, and by the eyelids in front. It is further supported behind and on the sides by a quantity of loose fat, which fills up all the interstices of the orbit and facilitates the various movements of which the eye is capable. The form of the eyeball is nearly spherical; but on viewing the organ in profile we see that it is composed of segments of two spheres of different diameters. Of these the anterior, formed by the transparent cornea, has the smaller diameter and is therefore more prominent, and hence the anteroposterior slightly exceeds (by about a line) the transverse diameter. The radius of the posterior or sclerotic segment is about $\frac{11}{16}$, and that of the anterior segment about $\frac{13}{16}$, of an inch. When the eyes are in a state of repose, their anteroposterior axes are parallel; the optic nerves, on the other hand, diverge considerably from their commissure within the cavity of the skull to the point where they enter the globe; consequently their direction does not coincide with that of the eye. Each nerve enters the back of the globe at a distance of about $\frac{1}{2}$ of an inch on the inner side of the anteroposterior axis of the eye.

The eyeball is composed of several investing membranes and of certain transparent structures which are inclosed within them, and which, together with the cornea, act as refractive media of various densities upon the rays of light which enter the eye.

The outermost coat of the eye is the *sclerotic*

(from Gk. *σκληρός*, *sklēros*, hard). It is a strong, dense, white, fibrous structure, covering about four-fifths of the eyeball, and leaving a circular deficiency anteriorly, which is occupied by the

cornea. Posteriorly it is perforated by the optic nerve, and it is there continuous with the sheath which that nerve derives from the dura mater, the fibrous investment of the brain and spinal cord. Near the entrance of the nerve its thickness is about $\frac{1}{10}$ of an inch; from this it diminishes to about $\frac{1}{20}$; but in front it again becomes thicker, from the tendinous insertions of the straight muscles which blend with it. This coat, by its great strength and comparatively unyielding structure, maintains the inclosed parts in their proper form and serves to protect them from external injuries.

The *cornea* (so called from its horny appearance) is a transparent structure, filling up the aperture left in the anterior part of the sclerotic. Its circumference is overlain by the free edge of the sclerotic, which in some parts presents a groove, so as to retain it more firmly; and the connection by continuity of texture between the two structures is so close that they cannot be separated in the dead body without considerable maceration. The cornea, in consequence of its greater convexity, projects beyond the line of the sclerotic; the degree of convexity, however, varies in different persons and at different periods of life. It is thicker than any part of the sclerotic, and so strong as to be able to resist a force capable of rupturing that tunic. Although perfectly transparent and apparently homogeneous, it is in reality composed of five layers, clearly distinguishable from one another—viz. (proceeding from the front backward): 1. The conjunctival layer of epithelium. It is in this epithelium that particles of iron, stone, etc., forcibly driven against the eye usually lodge, and it is a highly sensitive membrane. 2. The anterior elastic lamina forming the anterior boundary of the cornea proper; it is not more than $\frac{1}{2000}$ of an inch in thickness, and its function seems to be that of maintaining the exact curvature of the front of the cornea. 3. The cornea proper, on which the thickness and strength of the cornea mainly depend. 4. The posterior elastic lamina, which is an extremely thin membrane, in which no structure can be detected. It probably contributes, like the anterior lamina, to the exact maintenance of the curvature of the cornea, so necessary for correct vision. 5. The posterior endothelium of the aqueous humor, which is probably concerned in the secretion of that fluid.

The *choroid coat* is a dark-colored vascular membrane, which is brought into view on the removal of the sclerotic. Its outer surface, which is nearly black, is loosely connected with the sclerotic by connective tissue, in which are contained certain nerves and vessels (termed the ciliary nerves and vessels) which go to the iris. Its inner surface is soft, villous, and dark-colored. In front it is attached to the membrane of the vitreous humor by means of the ciliary processes, which consist of about 60 or 70 radiating folds. These are alternately long and short, each of them being terminated by a small, free, interior extremity, and they are lodged in corresponding folds in the membrane of the vitreous humor. In other parts it is loosely connected with the retina. The choroid is composed of minute ramifications of vessels (especially of veins which, from their whorl-like arrangement, are termed *vasa vorticosa*), of connective tissue, and of pigment cells, which usually approximate to the hexagonal form and are about $\frac{1}{1000}$ of an inch in diameter. In albinos this pigment is absent, and hence their eyes have a pink appearance, which is due to the unconcealed blood in the capillaries of the choroid and iris. See ALBINO.

The *iris* may be regarded as a process of the choroid, with which it is continuous, although there are differences of structure in the two membranes. It is a thin, flat, membranous curtain, hanging vertically in the aqueous humor in front of the lens and perforated by the pupil for the transmission of light. It divides the space between the cornea and the lens into an anterior (the larger) and a posterior (the smaller) chamber, these two chambers freely communicating through the pupil. The outer and larger border is attached all round to the line of junction of the sclerotic and the cornea, while the inner edge forms the boundary of the pupil, which is nearly circular, and varies in size according to the action of the muscular fibres of the iris, so as to admit more or less light into the interior of the eyeball, its diameter varying, under these circumstances, from about $\frac{1}{8}$ to $\frac{1}{4}$ of an inch. It is muscular in its structure, one set of fibres being arranged circularly round the pupil and, when necessary, effecting its contraction; while another set lies in a radiating direction from within outward and by its action dilates the pupil. These fibres are of the unstriped and involuntary variety. The nerves which are concerned in these movements will be presently noticed.

The *ciliary muscle* is a thin band or ring of nonstriated muscular fibres which lies between the iris and the choroid. Its posterior attachment is to the anterior margin of the choroid, while anteriorly it is attached by an annular ligament to the outer margin of the iris and to the adjacent portions of the cornea and sclera. By the contraction of this muscle the choroid is drawn forward, the suspensory ligament of the lens is relaxed, and *accommodation* of the eye is effected. The varieties of color in the eyes of different individuals, and of different kinds of animals, depend mainly upon the color of the pigment which is deposited in cells in the substance of the iris.

Within the choroid is the *retina*, which, although continuous with the optic nerve—which it is usually regarded as a cuplike expansion—differs very materially from it in structure. Before noticing the elaborate microscopical

structure of this part of the eye, we shall briefly mention those points regarding it which can be established by ordinary examination. It is a delicate semitransparent sheet of nervous mat-

DIAGRAM ILLUSTRATING THE MECHANISM OF ACCOMMODATION OF THE EYE.

In B the lens is accommodated for near objects; in A it is accommodated for objects at a distance.

ter, lying immediately behind the vitreous humor, and extending from the optic nerve nearly as far as the lens. On examining the concave inner surface of the retina at the back of the eye, we observe, directly in a line with the axis of the globe, a circular yellow spot called "*macula lutea*," and known, after its discoverer, as "*the yellow spot of Sümmering*," of about $\frac{1}{10}$ of an inch in diameter. The only mammals in which it exists are man and the monkey. It is the area of most distinct vision—a circumstance which may partly be accounted for by the fact that it is singularly free from blood vessels, which curve round it and apparently avoid it. The structure of the retina, as revealed by the microscope, is remarkable. Although its greatest thickness (at the entrance of the optic nerve) is only about $\frac{1}{10}$ of an inch, and as it extends anteriorly it soon diminishes to $\frac{1}{100}$ of an inch, the following layers from without inward may be distinguished in all parts of it: (1) the layer of rods and cones, termed, from its discoverer, the *membrane of Jacob*; (2) the external limiting membrane; (3) the outer nuclear layer; (4) the outer molecular layer; (5) the inner nuclear layer; (6) the inner molecular layer; (7) the layer of ganglion cells; (8) the layer of nerve fibres; (9) the internal limiting membrane.

It now remains to describe the *transparent media* which occupy the interior of the globe, and through which the rays of light must pass before they can reach the retina and form on it the images of external objects.

Immediately behind the transparent cornea is the *aqueous humor*, which fills up the anterior and posterior chambers which lie between the cornea and the lens. As its name implies, it is very nearly pure water, with a mere trace of albumen and chloride of sodium. As no epithelium exists in front of the iris, or on the anterior surface of the lens, it is most probably secreted by the cells on the posterior surface of the cornea.

The *crystalline lens* lies opposite to and behind the pupil, almost in contact with the iris, and its posterior surface is received into a corresponding depression in the vitreous humor. In form, it is a double-convex lens, with surfaces of unequal curvature, the posterior being the most convex. It is inclosed in a transparent capsule, of which the part covering the anterior surface is nearly four times thicker than that at the posterior aspect, in consequence, doubtless, of greater strength being required in front, where there is no support, than behind, where the lens is adherent to the vitreous membrane. The

microscopic examination of the substance or body of the lens shows it to be composed of extremely minute, elongated, ribbon-like structures, commonly called the *fibres of the lens*, which are developed from cells. These fibres are arranged side by side in lamellæ, of which many hundred exist in every lens, and which are so placed as to give to the anterior and posterior surfaces the appearance of a central star, with meridian lines. The lens gradually increases in density, and at the same time in refracting power, towards the centre; by this means the convergence of the central rays is increased, and they are brought to the same focus as the rays passing through the more circumferential portions of the lens. (According to Brewster, the refracting power at the surface is 1.3767, and at the centre 1.3990.) The lens contains 58 per cent of water, 36 of albumen, with minute quantities of salts. In consequence of its proteid constituent, it becomes hard and opaque on boiling, as we familiarly see in the case of the eyes of boiled fish. In the adult its long diameter ranges from $\frac{1}{8}$ to $\frac{3}{8}$, and its antero-posterior diameter from $\frac{1}{16}$ to $\frac{1}{4}$ of an inch, and it weighs three or four grains.

The *vitreous humor* lies in the concavity of the retina and occupies about four-fifths of the eye posteriorly. It is inclosed in the hyaloid membrane, which sends numerous processes inward, so as to divide the cavity into a series of compartments, and thus to equalize the pressure exerted by the inclosed soft, gelatinous mass. Between the anterior border of the retina and the border of the lens we have a series of radiating folds, or plaitings, termed the *ciliary processes of the vitreous body*, into which the *ciliary processes of the choroid* dovetail. The vitreous humor contains 98.4 per cent of water, with a trace of albumen and salts, and hence, as might be expected, its refractive index is almost identical with that of water.

The appendages of the eye may now be described. The most important of these are the *muscles within the orbit*, the *eyelids*, the *lachrymal apparatus*, and the *conjunctiva*, to which (although less important) we may add the *eyebrows*.

The *muscles* by which the eye is moved are four straight (or *recti*) muscles, and two oblique (the superior and inferior). The former rise from the margin of the optic foramen at the apex of the orbit and are inserted into the sclerotic near the cornea, above, below, and on either side. The superior oblique arises with the straight muscles, but, after running to the upper edge of the orbit, has its direction changed by a pulley and proceeds backward, outward, and downward. The inferior oblique arises from the lower part of the orbit and passes backward, outward, and upward. The action of the straight muscles is sufficiently obvious from their direction—when acting collectively they fix and retract the eye, and when acting singly they turn it towards their respective sides. The oblique muscles antagonize the recti and draw the eye forward; the superior, acting above, directs the front of the eye downward and outward, and the inferior upward and inward. By the duly associated action of these muscles, the eye is enabled to move (within definite limits) in every direction.

The *eyelids* are two thin, movable folds placed in front of the eye to shield it from too strong light and to protect its anterior surface. They

are composed (1) of skin; (2) of a thin plate of fibrocartilage, termed the tarsal cartilage, the inner surface of which is grooved by 30 or 40 parallel vertical lines, in which the Meibomian glands are embedded; and (3) of a layer of mucous membrane, continuous, as we shall presently see, with that which lines the nostrils and which joins the skin at the margin of the lids, in which the eyelashes (*cilia*) are arranged in two or more rows. The upper lid is much the larger, and to the posterior border of its cartilage a special muscle is attached, termed the *levator palpebræ superioris*, whose object is to elevate the lid and thus open the eye; while there is another muscle, the *orbicularis palpebrarum*, which surrounds the orbit and eyelids and by its contraction closes the eye. The Meibomian glands secrete a sebaceous matter, which facilitates the free motion of the lids and prevents their adhesion. The eyelashes intercept the entrance of foreign particles directed against the eye and assist in shading that organ from an excess of light.

The *lachrymal apparatus* consists of the lachrymal gland, by which the tears are secreted; two canals, into which the tears are received near the inner angle of the eye; the sac, into which these canals open; and the duct, through which the tears pass from the sac into the nose. The gland is an oblong body, about the size of a small almond, lying in a depression in the upper and outer part of the orbit. The fluid secreted by it reaches the surface of the eye by seven or eight ducts, which open on the conjunctiva at its upper and outer part. The constant motion of the upper eyelid induces a continuous gentle current of tears over the surface, which carry away any foreign particles that may have been deposited on it. The fluid then passes through two small openings (termed the *puncta lachrymalia*) into the canals; whence its further course into the lower portion of the nose is through the lachrymal duct. The conjunctiva (or mucous coat), which covers the front of the eyeball and lines the inner surface of the lids, passes down and lines the canals, sac, and duct, and is thus seen to be continuous with the nasal mucous membrane, of which it may be regarded as an offshoot or digital prolongation. See MUCOUS MEMBRANES.

We shall conclude this sketch of the anatomy of the human eye with a brief mention of the *nerves* going to this organ and its appendages. Into each orbit there enters a nerve of *special sense*, viz., the optic nerve; a nerve of *ordinary sensation*, viz., the ophthalmic branch of the fifth nerve; and certain nerves of *motion* going to the muscular tissues and regulating the movements of the various parts, viz., the third, fourth, and sixth nerves. As the optic tracts from which the *optic nerves* originate are noticed in the article NERVOUS SYSTEM, we shall merely trace these nerves from their *chiasma*, or commissure, forward. This commissure results from the junction of the optic tracts of the two sides, and it is especially remarkable for the fact that it presents a partial decussation of the nervous fibres, the central fibres of each tract passing into the nerve of the *opposite* side, and crossing the corresponding fibres of the other tract; while the outermost fibres, which are much fewer in number than the central ones, pass to the optic nerve of the *same* side. In front of the commissure the nerves enter the optic foramen at the apex of the orbit, receive a sheath or in-

vestment from the *dura mater*, acquire increased firmness, and finally terminate in the retina. The peculiar mode of termination of the optic nerves in the cuplike expansion of the retina, the impairment or loss of vision which follows any morbid affection of them, and the constant relation in size which is observed in comparative anatomy between them and the organs of vision, afford sufficient evidence that they are the proper conductors of visual impressions to the sensorium.

The first or ophthalmic division of the tri-facial nerve sends branches to the skin of the eyelids and to the conjunctiva. It is the nerve of ordinary sensation of the eye. The most important of the nerves of motion of the eye is the third nerve, or *motor oculi*. It supplies with motor power the elevator of the upper eyelid and all the muscles of the globe, except the superior oblique and the external rectus muscle, and, in addition to this, it sends filaments to the iris and other muscular fibres within the eye. Irritation of its trunk induces convulsive contraction of the principal muscles of the ball and of the iris; while division of the trunk occasions an external squint, with paralysis of the upper eyelid and fixed dilatation of the pupil. The squint is caused by the action of the external straight and the superior oblique muscles, while the other muscles are paralyzed by the operation. The normal motor action of the nerve upon the iris in causing contraction of the pupil is excited through the optic nerve and affords a good illustration of *reflex action*, the stimulus of light falling upon the retina and, through it, exciting that portion of the brain from which the third nerve takes its origin. This nerve exerts a double influence in relation to vision: (1) it mainly controls the movements of the eyeball and the upper eyelid; and (2) from its connection with the muscular structures in the interior it regulates the amount of light that can enter the pupil and probably takes part in the adjusting power of the eye to various distances.

The fourth nerve supplies the superior oblique muscle, the sixth nerve regulates the movements of the external rectus—the only two muscles in the orbit which are not supplied by the third pair. The facial nerve sends a motor branch to the *orbicularis* muscle, by which the eye is closed.

Physiology. A general knowledge of the ordinary laws of geometrical optics (see LIGHT; LENS; ETC.) is assumed. If a luminous object—as, e.g., a lighted candle—be placed at about the ordinary distance of distinct vision (about 10 inches) from the front of the eye, some rays fall on the sclerotic and, being reflected, take no part in vision. The more central ones fall upon the cornea, and of these some also are reflected, giving to the surface of the eye its characteristic glistening appearance; while others pass through it, are converged by it, and enter the aqueous humor, which probably exerts no perceptible effect on their direction. Those which fall on and pass through the outer part of the cornea are stopped by the iris, and are either reflected or absorbed; while those which fall upon its more central part pass through the pupil and are concerned in vision. In consequence of its refractive power the rays passing through a comparatively large surface of the cornea are converged so as to pass through the relatively small pupil and impinge upon the

lens, which, by the convexity of its surface and by its greater density towards the centre, increases the convergence of the rays passing through it. They then traverse the vitreous humor, whose principal use appears to be to afford support to the retina, and are brought to a focus upon that tunic, forming there an inverted image of the object.

This inversion of the image may be easily exhibited in the eye of a white rabbit or other albino, after removing the muscles, etc., from the back part of the globe. The flame of a candle held before the cornea may be seen inverted at the back of the eye, increasing in size as the candle is brought near, diminishing as it retires, and always moving in a direction opposite to that of the flame.

The adaptation of the eye to distinct vision at every distance beyond that of a few inches is brought about by a process known as *accommodation*. The essential factor in the process is the contraction of the ciliary muscle, which, as previously noted, allows the suspensory ligament of the lens to relax, with a resultant bulge of its anterior surface and a decrease in its focal length. According to Helmholtz, the radius of curvature of the anterior surface of the lens diminishes on turning the eye to a near object from 10 to 6 millimeters (from about 0.4 to 0.24 of an inch), while the most projecting point of the same surface is brought forward about 0.2 of an inch. According to the observations of Hueck, the focal distance may be changed about three times in a second. The accommodation from a near to a distant object is effected much more rapidly than the converse process.

There are two forms of defective vision in which this power of adaptation is very much limited—viz., shortsightedness, or *myopia*, and longsightedness, or *hypermetropia*. The limitation, however, is not due to a defect in the muscular apparatus to which we have referred, but to an abnormality either in the curves of the refracting media or to congenital or acquired changes in the anteroposterior diameter of the eyeball. In *shortsightedness* from too great a refractive power from either cause, the rays from objects at the ordinary range of distinct vision are brought too soon to a focus, so as to cross one another, and begin to diverge before they fall on the retina, the eye in this case being able to bring to the proper focus on the retina only those rays which were previously diverging at a large angle from a very near object. The correction for this deficiency is accomplished by interposing between the eye and indistinctly seen objects a *concave* lens, with a curvature just sufficient to throw the images of external objects at the ordinary distance of distinct vision backward upon the retina. In *farsightedness*, on the other hand, there is an abnormal diminution of the refractive power from too flat a cornea, a deficient aqueous humor, or a flattening of the lens, so that the focus is behind the retina. This defect is corrected by *convex* lenses, which increase the convergence of the rays of light. Presbyopia, as its name indicates, usually comes on at a comparatively advanced period of life and is due to senile changes affecting the elasticity of the lens and its attachments.

We have already noted the most essential use of the iris—viz., its power, under the influence of light upon the retina, of modifying the size of the pupil so as to regulate the amount of

light entering the eye. But this is not its only use, one of its offices being to prevent the passage of rays through the circumferential part of the lens, and thus to obviate the indistinctness of vision which would arise from *spherical aberration* (the unequal refraction of the rays passing through the centre and near the margin of the lens), in the same manner as the diaphragms employed by the optician. But there are two other means by which this spherical aberration is prevented, which admirably illustrate the marvelous mechanism of the eye. They are described by Wharton Jones as follows:

1. "The surfaces of the dioptric parts of the eye are not spherical, but those of the cornea and posterior surface of the lens are hyperbolic, and that of the anterior surface of the lens elliptical—configurations found by theory fitted to prevent spherical aberration. This discovery was made at a time when it was not known but that the dioptric parts of the eye had spherical surfaces.

2. "The density of the lens diminishing from the centre to its periphery, the circumferential rays are less refracted than they would have been by a homogeneous lens with similar surfaces."

Chromatic aberration, which is caused by the unequal refrangibility of the primitive rays of which white light is composed, when transmitted through an ordinary lens, whereby colored fringes are produced, is *practically* corrected in the eye, although it is doubtful whether it is *entirely* absent. The provision, however, on which the achromatism depends has not been determined with certainty, probably because we do not yet know the relative refractive and dispersive powers of the cornea and humors of the eye. Sir David Brewster denies that the chromatic aberration receives any correction in the eye and maintains that it is imperceptible only in consequence of its being extremely slight. See also VISION.

EYE. A loop, ring, or hole through a substance; also direction, as in *the wind's eye*. The extreme forward part of a ship is called the *eyes of the ship*. Chinese junks and other native craft have blocks of wood shaped and painted to resemble human eyes placed on each side of the bow, and the hawse holes of ships of Europe and America are sometimes compared to eyes and may at one time have been so called. The *eyes* of the rigging are loops formed in the shrouds or stays for fitting around the mast-heads. A *deadeye* is a block of hard wood (usually lignum vitæ) pierced with several holes. Two deadeyes are made to form a sort of tackle by reeving a rope through them; in rigged ships of old type the lower ends of shrouds and stays were secured to such tackles, which were kept in place permanently. An *eyebolt* is a bolt that has a projecting end formed in the shape of a ring for the purpose of hooking a tackle or attaching a rope. *Eyelets*, or eyelet holes, are small circular holes in sails, awnings, etc., through which pass small ropes. An *eye-splice* is an eye formed at the end of a rope by separating the strands at the end and sticking them between the strands in a special manner at the proper place.

EYE, COMPARATIVE ANATOMY OF THE. How far down in the scale it is necessary to go to find animals which have no eyes depends upon whether we mean by "eye" an organ capable of forming optical images, or simply an organ

capable of responding to the stimulus of light. If the latter is really an eye, then we are justified in saying that all the large groups of animals higher than sponges have eyes, though many families and even some orders may lack them. Among cœlenterates, simple light-detecting organs, known as pigment spots, or "pigment eyes," and consisting of groups of pigment cells associated with sensory cells, occur in many medusæ and in ctenophores. In some cases the cuticle over these spots is specially thickened to form a sort of lens. Similar pigment eyes occur among the flatworms (*Platoda*), and in some cases they are somewhat more complicated by the addition of so-called retinal cells with rodlike processes. It is very doubtful, however, whether these eyes are really anything more than light-detecting organs. Pigment eyes very similar to these, though often somewhat more complicated, occur in many worms, crustaceans, insects, and mollusks, and in a few echinoderms. The eyes of tunicates and of *Amphioxus* are not of any higher degree of organization. In crustaceans the pigment eye is known as the "unpaired" eye and is apparently made up of three simple eyes fused together. In insects the pigment eyes are called "ocelli," and these also occur in spiders and scorpions. Pigment eyes are of service to their possessors in enabling them to distinguish between light and shade and in detecting different degrees of light. Thus, shadows cast by an approaching enemy would be noticed, and, in aquatic animals, approach to the surface would be quickly indicated.

Turning now to those organs which unquestionably form some sort of image, we find there are two very distinct kinds—"simple" and "compound" eyes. Simple eyes correspond in structure to a greater or less degree with the eye of man, while compound eyes are of a totally different kind. The latter are found only among arthropods, where they reach a high degree of development, the so-called compound eyes of some mollusks and sea urchins being really much less complex. In arthropods the optic nerve bears two noticeable swellings—the optic ganglion, really a part of the brain, and the retinal ganglion, from which radiate the nerve fibres, entering the retinal cells. The retinal cells are grouped in clusters of four to seven, known as "retinula," which are more or less heavily pigmented distally. Each retinula is the basal part of a single eye, the upper portion of which consists of a crystal cone (wanting in the eyes of many insects) and of hypodermal elements covered with the chitinous cuticle developed as a cornea. These single eyes are crowded together, though separated from each other by pigment cells, on a strongly convex basal membrane, thus forming a more or less convex compound eye. Rays of light falling on the eye are absorbed without giving rise to a visual stimulus, except such as are directly parallel to the long axis of the single eyes. Each of these eyes therefore forms an image of that which lies directly before it, and the whole compound eye thus forms a mosaic, probably with sharp outlines, but wholly lacking perspective.

Image-Forming Eyes. Such are first found in the animal kingdom in the group of Cubomedusæ, where, especially in the genus *Charybdea*, each individual possesses several quite complex eyes provided with lens, vitreous body, and retina. Many worms have very well-formed and often large eyes. It is among mollusks

that we find the best-developed eyes among invertebrates. The eyes of dibranchiate cephalopods, as the squid, have a very complex structure, all of the parts essential to good sight in man's eye being present. There is, however, one very important difference between the cephalopod and the vertebrate eye, and that is that in the former the retinal-cell rods lie inside the limiting membrane and are thus turned towards the light, while in vertebrates these visual rods are turned away from the light. In some mollusks, with much simpler eyes, the retinal-cell rods are turned away from the light, as in vertebrates.

Eye in Vertebrates. Passing now to the consideration of the vertebrate eye, we find that the structure is in all cases essentially similar to that of the human eye, though many cases of degenerate eyes are known, associated with some peculiarities of habit, as, in the hagfish, with a parasitic mode of life; or, as in the cave salamanders and fishes, with living in the dark. (See CAVE ANIMALS.) In fishes the eyes have little power of movement, the cornea is very flat, and the lens is globular; the eyes are thus accommodated, when at rest, for seeing *near* objects. The sclerotic is frequently calcified or ossified, and there is no ciliary muscle. In amphibians the eyes are somewhat simpler than in fishes, but the ciliary muscle is present as in all higher vertebrates. In both fishes and amphibians we find examples of angular pupils. In reptiles the eye shows slight advance in structure, in respect to some special peculiarities; thus, in lizards there is a ring of bony sclerotic plates and a curious structure, the "pecten" (also present in snakes, crocodilians, and especially in birds), the function of which is in dispute, some saying it is concerned solely with the nutrition of the eye, others that it aids in accommodation. In birds the eyeball is not nearly spherical (as in other vertebrates), but is elongated so that it is much deeper than high. This is most marked in owls. In mammals the sclerotic is entirely fibrous, the external surface of the lens is less convex than the internal, and there is no pecten. The pupil is variously shaped. In aquatic mammals the cornea is flattened as in fishes.

Bibliography. Lang, *Text-Book of Comparative Anatomy* (New York, 1896); Wiedersheim, *Vergleichende Anatomie der Wirbelthiere* (Jena, 1902), contains a bibliography; Carrière, *Die Sehorgane der Thiere* (Munich, 1885); Gegenbaur, *Vergleichende Anatomie der Wirbelthiere* (Leipzig, 1898).

EYE, DISEASES OF THE. The diseases of the eye are very numerous, owing to the variety of the tissues and parts of which the eye is formed. Nearly all its parts are liable to inflammation and its consequences. (See OPHTHALMIA; RETINITIS.) The eyelids are liable to various diseases, morbid growths, most of which the surgeon may remove, and inflammation (see BLEPHARITIS; STYE); they may be misdirected inward or outward, *entropion* and *ectropion* (qq.v.); and the upper eyelid may droop (*ptosis*) from paralysis of the motor oculi nerve, increased weight of the lid, or atrophy or loss of the eyeball. The eyelashes may grow in upon the eye (*trichiasis*, q.v.) and produce serious results. The duct whose function is to convey the tears to the nose is liable to inflammation and obstruction. (See LACHRYMAL ORGANS.) The cornea is liable to ulceration and opacity in various degrees. (See CORNEA.) Collections

of pus (*hypopyon*) are found in the anterior chamber, as the result of corneal ulceration and iritis. (For inflammation of the mucous membrane covering the eyeball and eyelids, see CONJUNCTIVITIS.) The pupil may be closed as the result of iritis (q.v.) or of operations for cataract. (For opacities of the crystalline lens, see CATARACT. For an account of inflammation of the optic nerve, see OPTIC NEURITIS.) An important disease of the eye is glaucoma (q.v.). Various affections of vision may arise from peculiar or altered conditions of refraction, changes in the nerves, or in the action of the muscles moving the eyeball. (See SIGHT, DEFECTS OF.) The parts between the eye and its bony orbit may be the seat of inflammation, abscess, or tumor, making the eye protrude. The movements of the eyeballs may be affected from paralysis of the motor nerves, or from contraction or weakness of the muscles, causing squinting. (See STRABISMUS.) The eye may become insensible from paralysis of the fifth pair of nerves. Substances thrown against the eye may injure it. If a caustic alkaline substance has entered the eye, weak vinegar or milk is the best thing to introduce until the physician arrives. If oil of vitriol (sulphuric acid) has been the cause of the injury, a weak solution of soda may be used in the first place to neutralize the acid. In gunpowder explosions near the eye, besides the burn, the particles are driven into the surface of it and will cause permanent bluish stains over the white of the eye unless they are carefully removed at the time. When chips of glass, stone, etc., are driven into the interior of the eye, there is great danger of destructive inflammation and sympathetic ophthalmia. (See OPHTHALMIA.) Commonly foreign bodies, as dust, sand, seeds, flies, etc., enter the space between the eyeball and the lids, almost always concealed under the upper, as it is the larger and sweeps the eye. They cause great pain, from the firmness and sensitiveness of the papillary surface of the lid, soon excite inflammation, and their presence is apt to be overlooked. The lid must be turned over to find them. To do this, pull the edge of the lid forward by the eyelashes and at the same time press down the back part of the lid with the tip of the left forefinger or with a small pencil or key. The lid will readily turn over, when the body may be seen and removed with a corner of a handkerchief. In other cases a solution of cocaine must be instilled and a needle used to dislodge the particle. After removal irritation may persist for some time. Particles of steel penetrating the interior of the eyeball may be removed by means of a powerful magnet, often with comparatively little damage to sight. Consult May, *Manual of Diseases of the Eye* (New York, 1909), and Weeks, *Diseases of the Eye* (Philadelphia, 1912).

EYE, Y'e, AUGUST VON (1825-96). A German art historian, born at Fürstenu, Hanover. He was educated at Göttingen and Berlin, and in 1853 was appointed superintendent of the department of art and antiquities in the Germanic Museum, Nuremberg; in 1875 became professor in the School of Decorative Arts, Dresden; and in 1879 he emigrated to Brazil, returning after a few years to settle at Nordhausen. He wrote valuable works on ancient and modern art and on philosophical subjects. The best known of his works is his *Leben und Werke Albrecht Dürers* (Nördlingen, 1860; 2d ed.,

1869). He also edited a number of illustrated works treating the history of art and culture, including *Kunst und Leben der Vorzeit* (Nuremberg, 1868); *Galerie der Meisterwerke alt-deutscher Holzschnedekunst* (ib., 1858-61), written in collaboration with Jacob Falke; *Deutschland vor 300 Jahren in Leben und Kunst* (Leipzig, 1857); *Die neue Weltanschauung* (ib., 1891); *Albrecht Dürers Leben und künstlerische Tätigkeit* (Wandsbeck, 1892). His principal philosophical work is *Das Reich des Schönen* (Berlin, 1878).

EYE OF GREECE. An ancient epithet of Athens.

EYE/PIECE', or OCULAR. The lens or lenses by means of which the image of the object formed at the focus of a telescope or microscope is observed. See TELESCOPE; MICROSCOPE.

There are two forms of eyepieces in general use, each of which possesses advantages for certain classes of work. In the Ramsden eyepiece there are two planoconvex lenses of equal focus placed with their curved sides towards each other. As the image is formed beyond the lenses, this eyepiece can be used in micrometer microscopes. (See MICROMETERS.) In the Huygenian eyepiece there are two planoconvex lenses, the lower of which has a focal length several times greater than that of the upper. The curved face of the upper lens faces towards the plane face of the lower, and the image is formed between the two. Consult Carpenter, *The Microscope* (8th ed., Philadelphia, 1901).

EYERMAN, Y'er-man, JOHN (1867-). An American geologist and genealogical writer. He was born at Easton, Pa., of Pennsylvania Dutch ancestry, was educated at Lafayette College, and continued his studies at Harvard and Princeton universities. He was a lecturer on determinative mineralogy at Lafayette College, and in 1890 became associate editor of the *American Geologist*. His publications include: *The Mineralogy of Pennsylvania* (1891); *A Course in Determinative Mineralogy* (1892); *The Old Graveyards of Northampton* (2 vols., 1899-1901); *Some Letters and Documents* (2 vols., 1900); *Genealogical Studies* (1902).

EYE STRAIN. A term for the result of using the eyes under improper conditions; an important cause of waste of nerve force, frequently the reason for neurasthenia, headache, chorea, hysteria, convulsions, and dementia. It may be occasioned by the need of glasses or by the use of improper glasses, but is often produced by lack of balance of the ocular muscles. Proper glasses or ocular tenotomy constitute the remedy.

EYETEETH, also called CANINE or CUSPIDATE TEETH. The two teeth in the upper jaw next to the premolars, one on each side, the fangs of which extend far upward in the direction of the eye. See TEETH.

EYLAU, Y'lou, or PREUSSISCH-EYLAU, prou'shish-Y'lou. A town of some 3000 inhabitants, situated on the Pasma, about 24 miles south of Königsberg, Prussia. It is noted as the scene of a sanguinary battle between the French under Napoleon and a combined force of Russians and Prussians under Bennigsen and Lestocq, Feb. 7-8, 1807, which took place during the war with Prussia which marked the close of the struggle of Napoleon with the Third Coalition (1805-07). On the night of February 7 the French army came in touch with the rear guard of the Russians at Eylau. After a murderous fight,

during which the Russian position was thrice taken and lost, Soult succeeded in driving the enemy from the town. The following morning found the two armies drawn up at close range. Soult held the left wing of the French army; in the centre was the corps of Augereau; on the right flank was the division of Saint-Hilaire. Behind Augereau was Murat with his cavalry. On the extreme left and some 10 miles in advance of the main battle line was the corps of Ney, engaged in hot pursuit of 8000 Prussians under Lestocq. On the extreme right and also in advance was the corps of Davout. It was Napoleon's intention to throw Davout's forces against the extreme left flank of the Russians and by pressing it back upon the centre to send the entire hostile army flying in confusion towards Königsberg, where they would be intercepted by Ney. The plan miscarried, however, for Davout, delayed by a blinding snowstorm, did not deliver his attack before 1 o'clock in the afternoon. The battle began early in the morning with a furious cannonade, lasting several hours. Augereau's corps was then sent against the Russian centre, but was met with a terrific cannon fire and was almost annihilated. For a time the centre of the French army was threatened, and, to save the day, Murat's cavalry was hurled against the advancing forces of the Russians. They drove back the Russian cavalry, broke through the first two lines of infantry, but recoiled before the third, and could only regain their position by cutting their way through the lines of the enemy which had formed again behind them. Davout finally struck the enemy's left and succeeded in driving them from their position, and it seemed as if in spite of delay Napoleon's plan would be carried out after all. But at three o'clock in the afternoon Lestocq, who had succeeded in escaping from Ney, arrived on the battlefield with 5500 men and, passing in the rear of the entire Russian army, assailed Davout with his fresh troops. Davout's forces were slowly pushed back from the most advanced of the positions they had captured, but both sides were soon too exhausted to do more than hold each other in check. Late at night Ney arrived on the field, too late to bring victory to the French, but still in time to prevent a defeat which might have resulted from a concerted move on the part of the Russians. The numbers engaged were about 70,000 on either side. The losses were 18,000 for the Russians and Prussians and somewhat more for the French. Against the advice of his lieutenants, Bennigsen retreated during the night, leaving the French masters of the field. Direct results the battle had none, and Eylau has passed into history as a huge, profitless carnage. Indirectly, however, it strengthened the enemies of Napoleon by breaking the charm of his seeming invincibility. Napoleon had failed for the first time in a pitched battle, and his diplomatic standing suffered in consequence. A few days after the battle he started negotiations for peace with Frederick William. He was willing to surrender claim to all Prussian territory east of the Elbe and not to ask Prussia to help him in war with Russia. Prussia, through Hardenbergh, refused these terms. Napoleon then proposed an armistice for joint negotiations, a move which indicated his critical position. Consult: Oncken, *Das Leitalter der Revolution, des Kaiserreichs und der Befreiungskriege* (2 vols., Berlin, 1884-87); Von Schachtmeyer, *Die*

Schlacht bei preussisch Eylau (ib., 1857); Duncker, *Abhandlungen aus der neueren Geschichte* (Leipzig, 1887); M. Dumas, *Précis des événements militaires de 1799 à 1814* (19 vols., Paris, 1816-26).

EYLAYET. See VILAYET.

EYMER/ICUS, NICOLAS (1320-99). A Spanish theologian. He was born at Gerona, Catalonia, and entered the Dominican Order in 1334, rising to the rank of Grand Inquisitor, chaplain of Pope Gregory XI, and judge of heretics, in 1356. He lived successively in Aragon and Avignon, where he enjoyed the fullest confidence of Clement VI and his successor, Benedict XIII. He was considered the greatest canonist of his time and wrote the famous *Directorium Inquisitorum* (1503), which laid down the regulative maxims for inquisitors. Although very harsh, it was not enough so for Torquemada, who promulgated in 1484 a new code of procedure.

EYNARD, a'nâr', JEAN GABRIEL (1775-1803). A French banker, interested in the cause of Greek independence. He was born at Lyons, took part in the Lyons rising against the Convention, lived in Switzerland and then in Genoa, where he grew rich, and settled at Geneva in 1810. He was the Ambassador of the Republic of Geneva to the Congress of Vienna and in 1816 was appointed to assist in organizing the administration of Tuscany. He was the delegate of Tuscany at the Congress of Aix-la-Chapelle in 1818. In 1821 he became one of the foremost advocates of Greek independence and for his services was naturalized as a Greek citizen. He did not succeed in negotiating a loan for the revolutionary government in Paris and London, but personally contributed 700,000 francs. After conducting a sort of crusade throughout western Europe in behalf of the Greeks, he was instrumental in securing the throne of Greece for Otho of Bavaria. His fortune of 80,000,000 francs was bequeathed largely to charitable enterprises. He wrote *Lettres et documents officiels relatifs aux divers événements de Grèce* (1831) and *Vie de la baronne Krüdener* (1849). Consult Rothpletz, *Der Genfer Jean Gabriel Eynard als Philhellene* (Zürich, 1900).

EYRA, a'râ (South American name). A remarkable cat (*Felis eyra*) of eastern South America, Central America, and Mexico. It is about the size of the domestic cat, but its legs are much shorter, and its body, neck, and head so slender and elongated as to present a striking similarity in form to a civet, increased by the extraordinary length and thickness of its tail. The pupil of the eye is round, the ears rounded, and the muzzle compressed. The fur is soft, of a uniform reddish-yellow or chestnut color, with a whitish spot on each side of the upper lip and on the chin. It is most common in Brazil and Paraguay, but is known as far north as the borders of the United States. This is the cat to which the name represented by our word "cougar" (see COUGAR) was first applied; and it is known in Mexico as "apache." It seems easily capable of domestication, since the few specimens kept in zoological gardens have quickly become gentle and playful and sometimes have been at liberty about the buildings; and it is therefore sometimes adopted into the homes of the South Americans, but is likely to be mischievous to poultry. Eyras are expert hunters for small mammals and birds. Consult Azara, *Historia Natural de los Pájaros del Paraguay*,

etc. (Madrid, 1805), and Alston, "Mammals," in *Biologia Centrali-Americana* (London, 1879). See Plate of WILD CATS with CAT.

EYRE, *âr*. A large salt lake in the north-eastern part of the State of South Australia. It is the centre of the Salt Lake River system, the rivers belonging to which either rise in the southern and western slopes of the Great Dividing Range, or in the central group of the McDonnell ranges. They discharge into Lake Eyre through many devious channels so connected as to form a perfect network of interlacing water-courses. The lake (which receives most of the rivers of Central Australia) is 80 miles long by 40 wide, and its surface, below sea level, oscillates considerably between the wet season, when the rivers are bank-full, and the dry season, when much of the area is an arid desert.

EYRE, *âr* (Scottish variants also *air*, *aire*, from AF. *eire*, OF. *erre*, *oire*, journey, from Lat. *iter*, road), or **EIRE**, JUSTICES IN (corruption of Lat. *in itinere*). Itinerant, or, as we should say, circuit judges. By this term, both in England and Scotland, the judges of assize (q.v.) were formerly designated. Justices in eyre were first regularly established in England by Henry II, in the sixteenth year of his reign (1170). The inconveniences and the denials of justice resulting from the infrequency and irregularity of the royal progresses, at which justice was dispensed by the Curia Regis, throughout the kingdom, called for the institution of a different system. Accordingly, Henry appointed 12 justices to perambulate all the counties of England regularly and to hear the complaints of his subjects. The number of these itinerant judges was in 1176 increased to 18, and at the Grand Council at Windsor in 1179, to 21. The subsequent rapid development of the regular common-law courts, which resulted from the division of the Curia Regis and the institution of circuits regularly held by these, gradually threw the courts of the justices in eyre into the shade. They came to be regarded as of inferior position and authority and in 1335 ceased to be appointed. Thereafter the expression had no precise meaning in England, but was sometimes loosely employed to describe the judges of the King's Bench, Common Pleas, and Exchequer, when on circuit.

In Scotland the chief justiciar, says Erskine, i, 3, s. 25, was originally bound to hold yearly two justice courts or "aires" at Edinburgh and Peebles. This court gradually became fixed at Edinburgh. Besides this court, special "justice aires" were frequently held in the more remote parts of the country by the King in person, or by judges named by him, twice in the year—in spring and autumn (Stat. Rob. III, 1400, c. 30). These courts were discontinued, but revived by Statute of 1587, c. 81. The term is still in use in Scotland, where at the commencement of every circuit, proclamation is made to the lieges to attend the "circuit aire." See CIRCUIT; CURIA REGIS; COURT, and the authorities there referred to.

EYRE, *âr*, EDWARD JOHN (1815–1901). An English explorer and colonial governor. He was born in Yorkshire, England, but at 17 emigrated to Australia, where he soon became a magistrate and in 1845 published *Discoveries in Central Australia*. For his achievements he was honored by the Royal Geographical Society and received the appointment of Lieutenant Governor of New Zealand in 1846 and of St. Vincent in

1854. In 1864, after being acting Governor, he was made actual Governor of Jamaica, where in 1865 he used vigorous measures to suppress a negro insurrection. For the execution by court-martial of Gordon, who was thought to be one of the leaders, Eyre was censured and recalled on the ground that he had acted without sufficient evidence. On his return he was prosecuted for murder by a committee, of which John Stuart Mill was the most prominent member; but the charge was eventually dismissed, partly on the ground that the Jamaica Act of 1866 (which indemnified Eyre for his acts during the rising) protected him from civil suit or criminal prosecution. Ruskin, Tennyson, Thomas Carlyle, and Charles Kingsley were ardent defenders of Eyre, who retired from public service in 1874. Consult Hume's *Life of Edward John Eyre* (London, 1867).

EYRE, SIR JAMES (1734–99). An English judge, the son of Rev. Thomas Eyre, prebendary of Salisbury. He was born at Wells, Somersetshire, in 1734; became a scholar of Winchester in 1747, and a student of St. John's College, Oxford, in 1749. At the age of 19, without waiting to take his degree, he went to London and commenced to study law, being called to the bar in 1755. A few years later he became counsel to the Corporation of London, and in 1763 was made recorder. In the same year he gained a great reputation through the skill and eloquence with which he conducted the famous suit of *Wilkes v. Wood*, in which he successfully attacked the unconstitutional practice of the government in issuing general search warrants. (*State Trials*, xix. 1154.)

Eyre was knighted and made Baron of the Exchequer in 1772, became Chief Baron in 1787, and in 1793 was appointed Chief Justice of the Court of Common Pleas. In the latter capacity he presided at the famous state trials of Hardy, Horne Tooke, and others, for treasonable conspiracy, which resulted in the acquittal of the prisoners. For a short time, between the resignation of Lord Chancellor Thurlow, on June 15, 1792, and the accession of Lord Loughborough to the chancellorship on Jan. 21, 1793, Chief Justice Eyre held the highest judicial position in England, as Chief Commissioner of the Great Seal. As a lawyer and as judge he displayed the highest legal and judicial qualities. Though not profoundly learned, he was well versed in the common law, and his patience, tact, and ingenuity, combined with an extraordinary power of sifting evidence and a luminous style, made him one of the ornaments of the English bench. He died July 1, 1799. Consult Howell's *State Trials*, xix, 1154–55; xxiv, 199; xxv, 2, 748 (London, 1809–26), and Foss, *Lives of the Judges of England* (1848–64).

EYRE, JANE. See JANE EYRE.

EYRE, SIR ROBERT (1666–1735). An English judge, son of Sir Samuel Eyre, of Newhouse, Wiltshire, who was himself a judge of the King's Bench. Robert was born in 1666, entered Lincoln's Inn in 1683, and was admitted to the bar in 1689. Seven years later he became recorder of Salisbury, and from 1698 to 1710 represented that borough in Parliament. In 1707 he became Queen's counsel and the next year was appointed Solicitor-General. In that capacity it fell to his lot to conduct the celebrated Sacheverell case. He was knighted and made a justice of the Queen's Bench in 1710. He became Chief Baron of the Court of Exchequer

in 1723 and Chief Justice of the Common Pleas in 1725. Having been accused of official misconduct in connection with a case of malfeasance tried before him, his conduct was investigated by a committee of the House of Commons, which completely exonerated him. He was the intimate friend and associate of the great men of his time, and wielded considerable influence at court, but he never attained to the first rank among English judges. He died in 1735. Consult: Howell's *State Trials*, xv, xvii (London, 1809-26); Burnet, *History of his own Time* (ib., 1723-34); Foss, *Lives of the Judges of England* (ib., 1848-64).

EYRE, WILSON (1858-). An American architect, born in Florence, Italy. He was educated in Italy until 1869, then at Newport, R. I., for three years, at Lenoxville, Canada, for two years, and finally he graduated from the Massachusetts Institute of Technology in 1876. After spending five years with James P. Sims, architect, he was in independent practice from 1881 to 1912 and then became the partner (senior) of John Gilbert McIlvaine. He planned buildings for the Newcomb Memorial College, New Orleans, and the Detroit Club, Detroit, Mich.; many structures in Philadelphia and New York; and numerous country houses of unusual artistic merit. In 1910 he became an Associate National Academician and a member of the American Institute of Architects.

EYTELWEIN, Y'tel-vin, JOHANN ALBERT (1764-1848). A German engineer, born in Frankfort-on-the-Main. He was appointed director of the architectural school in Berlin, upon the opening of that institution in 1799. He conducted the hydraulic operations for the improvement of navigation on the Warthe, Weichsel, Oder, and Niemen; built the harbor extensions of Memel, Pillau, and Swinemünde; determined the boundaries of the Rhine Province; and established a system of weights and measures for Prussia. His principal works are the following: *Praktische Anweisung zur Bauart der Fuschinuerke an Flüssen und Stromen* (2d ed., 1818); *Vergleichung der in den preussischen Staaten eingeführten Masse und Gewichte* (2d ed., 1810); *Handbuch der Statistik fester Körper* (2d ed., 1832); *Handbuch der Hydrostatik* (1826); *Auflösung der höhern numerischen Gleichungen* (1837).

EYTE, it, MAX (1836-1906). A German engineer and author, born at Kirchheim-unter-Teck. In 1861 he became engineer in Fowler's manufactory of agricultural implements at Leeds, for which he traveled extensively abroad. He was chief engineer of Halim Pasha from 1863 to 1866, during which years the steam plow was introduced into Egypt. He was one of the founders of the German Agricultural Society. His principal works include: *Das Agrikulturwesen in Aegypten* (1867); *Steam Cable Towing* (1868); *Das Wasser im alten und neuen Aegypten* (1891); *Wanderbuch eines Ingenieurs: In Briefen* (1871-84), an interesting illustrated description of his travels; *Vollmar* (3d ed., 1876), an historical poem; *Mönch und Landsknecht* (2d ed., 1886); *Lebendige Kräfte* (1905).

EYTINGE, Y'ting, ROSE (1838-1911). An American actress and author, born in Philadelphia. From 1862 to 1869 she played in various theatres in New York City and then went abroad with her second husband, Col. George H. Butler, Consul General to Egypt. On her re-

turn thence in 1871 she took the rôle of Cleopatra at the Broadway Theatre, to the Antony of Frederick Warde. Among her principal later parts were Nancy Sykes in *Oliver Twist*, Gervaise in *Drink*, Ophelia to the Hamlet of E. L. Davenport, and Desdemona with James W. Wallack as Othello and Davenport as Iago. Her literary works include adaptations of Dickens's *Oliver Twist* and *Dombey and Son*, Browning's *Colombe's Birthday*, her personal *Recollections*, published serially, and *Memories* (1905). Consult Clapp and Edgett, *Players of the Present* (Dunlap Society, New York, 1899), and Winter, *The Wallet of Time* (2 vols., ib., 1913).

EYUK, ā-yook'. A village in Asia Minor, built upon the small plateau of a hill, 75 miles west-southwest of Amasia. It has only about 30 houses, but is important as containing some of the most remarkable ruins in the East. They are the remains of a palace of enormous extent and consist of colossal walls and blocks of granite containing a great variety of sculptures, chiefly gods, processions, and religious rites, many of which are in an admirable state of preservation. The building is one of the most significant monuments left by the Hittites, whose art and architecture as illustrated in the palace at Eyuk are chiefly derived from Assyria, though betraying Egyptian influences. Eyuk is located only a short distance from Boghaz Köi, which is now known, from the large finds of inscribed tablets made there by Winckler, to have been the ancient Hatti, capital of the Hittite Empire. (See HITTITES.) Consult: Perrot, *Exploration de la Galatie et de la Bithynie* (Paris, 1872); Perrot and Chipiez, *History of Art in Sardinia, Judaea, Syria, and Asia Minor* (Eng. trans., London, 1890); Humann and Puchstein, *Reisen in Kleinasien und Nordsyrien* (Berlin, 1890); Garstang, *The Land of the Hittites* (New York, 1910); Olmstead, Charles, and Wrench, *Hittite Inscriptions* (1911); Winckler, *Nach Boghaz Köi* (1914).

EYZAGUIRRE, ā's-thā-ge'ra, AGUSTIN (1766-1837). A Chilean statesman. He was one of the principal leaders in the movement for national independence in 1810 and in 1813 was a member of the first national Junta. He was taken prisoner by the Spaniards at the battle of Rancagua in October, 1814, and was imprisoned on the island of Juan Fernández for three years. He was subsequently engaged in an enterprise for the establishment of trade between Chile and India. On the downfall of the O'Higgins administration in 1823 he was elected President of the provisional Junta and soon afterward was elected to the office of Vice President. On the resignation of President Freire (Sept. 10, 1826) he became acting President and retained this position until January, 1827, when he was deposed by a military mutiny.

EZEKIEL (Heb. *Yehezqel*, God makes strong). One of the four "greater" prophets. He was the son of the priest Buzi, a member of the Zadokite clan, which towards the close of the seventh century B.C. began to obtain complete control of the Yahwe cult in Jerusalem. He probably spent his youth in the temple at Jerusalem until the year 597 B.C., when, with Jehoiachin, King of Judah, and a large number of the people, he was carried captive to Babylon by order of Nebuchadnezzar. There the Jews formed a separate community under the government of elders and engaged in agriculture. They probably paid a tax to the government,

but in other ways were left unmolested. Ezekiel settled at Tel-Abib on the banks of the river Chebar. This river has been identified with the canal Kabar mentioned in cuneiform documents of the time of Artaxerxes I (465-425 B.C.). It apparently lay somewhat to the east of Nippur (q.v.). He probably appeared as a prophet about the year 593 B.C. and continued to give oracles from time to time until 571 B.C. The date of his death is not recorded.

Ezekiel's life was short, as is evidenced by his book; but he spent his days in comforting and encouraging his people, while endeavoring to open their eyes to the real significance of current events and particularly of the national catastrophe with the resultant captivity of the people. Respected by the people, his influence was profound, though his task was a difficult one in rousing the masses, who were indifferent to the religious aspects of the situation. Ezekiel was essentially a priest. His interest is largely in matters connected with the ritual, but he also possesses the traits of a prophet. His imagination is impetuous, and features of his discourses are the visions, parables, and allegories with which they are filled. His style, while vigorous, lacks simplicity, and, on the whole, his moral tone, while strong, is also severe. He is a particularly interesting figure as representing the transition from the prophetic to the priestly period. His elaborate programme for the cult foreshadows the post-exilic history of Judaism which centres around the observance of the minutiae of religious ceremonialism. See EZEKIEL, BOOK OF.

EZEKIEL, BOOK OF. The third of the so-called greater prophets. It is held by most scholars that the prophecies of Ezekiel have come down to us, as concerns the subject matter, substantially in the form in which the prophet himself left them, though doubts have recently been cast on this point. The Hebrew text has not been well preserved and contains many additions by scribes and changes which indicate that a revision was made subsequent to the prophet's death, or possibly more than one revision. By means of the Greek translation, which is based on a text varying considerably from the Hebrew, many of the original readings can be restored, and the Hebrew text otherwise improved. The book, consisting of 48 chapters, may be divided into four sections, the contents of which may be summarized as follows:

Part i (chaps. i-xxiv) consists of an introduction reciting the vision of Yahwe seated on a celestial chariot throne supported and set in motion by four creatures, each having four wings and the face, respectively, of a man, a lion, an ox, and an eagle. (See **CHERUB**.) From the mouth of Yahwe Ezekiel receives his call to the prophetic office, his commission to act as a guide to Israel. There follow prophecies against the people of Israel (chaps. iv-xxiv), subdivided into 18 sections: 1. The siege of Jerusalem, represented by a picture drawn on a tablet; the prolonged transgressions of the people; and the hardships they should suffer, by the eating of a coarse and loathsome bread. 2. Judgments on the city by famine, war, and dispersion abroad, signified by hair and beard cut off, weighed, scattered, and burned. 3. Judgments against idolatry, with a promise that a remnant should be saved. 4. Captivity, inevitable, and severe, under the emblem of a chain. 5. Transgressions of Judah, represented by the image of

jealousy, and consequent judgments, typified by the scattering of fire, and the departure of the *shekinah*, or divine glory. 6. The captivity of Zedekiah, represented by the removal of household goods, and bread eaten with trembling. 7. False prophets reproved and threatened. 8. Idolatrous elders condemned. 9. The rejection of Jerusalem, represented by the burning of an unfruitful vine. 10. God's compassionate love, against which Israel had sinned, compared to kind care shown to a child cast out at its birth. 11. Judgments on Israel for turning to Egypt for help against Babylon, denounced under the emblem of two great eagles, one representing Nebuchadnezzar and the other Pharaoh. 12. Judgment denounced on every transgressor for his own sins, contrary to the common proverb implying that children suffer for their fathers' faults. 13. Captivity of the Jewish kings, represented by lions pursued and captured, and of the Jewish people, by a vine scorched, torn up, and planted in the wilderness. 14. God's mercies to Israel, and their continued transgression reviewed; and, while final forgiveness is promised to the penitent, impending judgments are declared. 15. A consumed forest represents Jerusalem destroyed, and a sharp sword, Nebuchadnezzar cutting down Ammonites and Jews. 16. Recital of sins committed in Jerusalem by all classes of the people, and judgments on them denounced. 17. Idolatries of Samaria and Jerusalem, and their punishment. 18. Dreadful destruction of Jerusalem again proclaimed.

Part ii consists of prophecies against various nations around Judea (chaps. xxv-xxxii), subdivided into three sections: 1. Against the Ammonites, Moabites, Edomites, and Philistines. 2. Against Tyre (represented, in its beauty, wealth, and renown, as the anointed cherub on the mountain of God), with a promise of returning prosperity to Israel. 3. Against Egypt. In the last two prophecies Nebuchadnezzar is named as the instrument appointed to carry out God's purposes.

Part iii embodies the promises of future deliverance to Israel (chaps. xxxiii-xxxix), subdivided into five sections: 1. The prophet is compared to a watchman appointed to give warning of danger and is exhorted to be faithful. While under the power of the prophetic spirit, being informed that Jerusalem had been taken by Nebuchadnezzar, he foretells the desolation of the land and reproves the hypocrisy of the captives around him. 2. The rulers, civil and ecclesiastical, condemned as unfaithful shepherds, and a general restoration of the people promised under the guidance of the good shepherd, David the prince. 3. Judgments against Edom again foretold. 4. Promises of restoration renewed to Israel, under the emblems of fruitful mountains, sprinkled water, a new heart, dry bones raised to life, and two sticks united together. 5. Destruction of Gog, followed by blessings to Israel.

The fourth series of discourses (chaps. xl-xlviii), while forming part of the general picture of the restoration, is separated by its character from the rest of the book. It gives (1) an elaborate picture of the future temple, based apparently on the temple of Solomon; (2) a description of the altar and offerings; (3) the functions of the priest; (4) the territorial distribution of the tribes and boundaries of the land.

There are two features of Ezekiel's prophecies

that are of special significance: (1) the visions, and (2) the descriptions of the temple cult. The former marks the beginning of that tendency in Jewish thought that led to the production of the extensive apocalyptic literature (q.v.), chiefly between the second century B.C. and the second century A.D. (See *ΑΠΟΚΡΥΦΑ*.) The latter stands midway between the Deuteronomic code and the final priestly legislation for which it paves the way. Ezekiel's programme and general notions of the functions and privileges of the priest agree largely with the so-called Holiness Code (Lev. xvii-xxvi), though the latter is thought by many scholars to represent an even more advanced ritualistic standpoint. A notable difference, however, between Deuteronomy and Ezekiel is that, whereas according to the former all Levites are priests, according to Ezekiel only the Zadokites are recognized, while in the Holiness Code only descendants of Aaron are regarded as priests. Again, as regards festive seasons, Deuteronomy mentions three great festivals—Passover, Weeks, and Booths—whereas Ezekiel omits the second, but adds a special ceremony of purification for the first days of the first and seventh months, and the Holiness Code has, in addition to the three given in Deuteronomy, the Feast of Trumpets (the postexilic New Year's Day) and the Day of Atonement.

The direction thus given by Ezekiel to the elaboration of the cult was followed in succeeding generations. It is his spirit that pervades the perfected law (see EZRA; ΠΕΝΤΑΤΕΥΧΗ), and in a significant sense Ezekiel may be designated as the forerunner of that Judaism which centres around the temple cult and ceremonial minutiae. This constitutes his main claim to an important position in Hebrew history. In moral sublimity and in eloquence he is surpassed by Isaiah and in profundity of feeling and the truest patriotism by Jeremiah. But it is Ezekiel who draws from the past, with its many tribulations and final catastrophe, the lesson that a future restoration must depend upon observance of Yahwe's decrees, and suggests, as their most important task, that the leaders determine in the most minute way what Yahwe has commanded and how he is to be worshiped, and then spare no efforts to have these regulations carried out. Salvation depends upon the temple cult, the constitution of a legitimate priesthood, and the strict obedience of the people to all such laws as are laid before it by its recognized religious leaders in the name of Yahwe.

Josephus (*Ant.*, x, 5, 1) declares that Ezekiel wrote and left behind him two books. It was supposed by Wildeboer, *De Letterkunde des Ouden Verbonds*, p. 296 (Groningen, 1893), that chaps. i-xxix and xl-xlviii constitute these two books. Zunz, Geiger, Seinecke, Vernes, and most recently Torrey (*Transactions of the Connecticut Academy*, New Haven, 1909), have regarded the entire book as the product of a later time. Manhot (*Jahrbücher für protestantische Theologie*, xiv, 423 ff.) and Bertholet have questioned Ezek. xxvii. 9 b-25 a. Polychronius and Grotius regarded the prophecy against Gog and Magog (Ezek. xxxviii-xxxix) as referring to Antiochus III; Winckler (*Alt-orientalische Forschungen*, ii, 160 ff., Leipzig, 1893) interpreted it as occasioned by the career of Alexander; N. Schmidt (*Encyclopædia Biblica*, iv, 4332 f., New York, 1903) suggested

that Mithradates VI of Pontus is the "prince of Meshech and Tubal." But, as a rule, the unity of the book is maintained by the interpreters. Consult the commentaries, particularly those of Smend, Keil, Davidson, Bertholet, Toy, Krätschmar, and the most recent ones by Loft-house (Oxford, 1907) and Redpath (New York, 1907); also Cornill, *Das Buch des Propheten Ezechiel* (Leipzig, 1886); D. H. Müller, *Ezechielstudien* (Berlin, 1894); Jahn, *Das Buch Ezechiel auf Grund der Septuaginta hergestellt* (Leipzig, 1905); Herrmann, *Ezechielstudien* (ib., 1908).

EZEKIEL, MOSES JACOB (1844-1917). An American sculptor. He was born in Richmond, Va., was educated in his native city, and fought in the Civil War. In 1869 he entered the Academy of Art in Berlin, where he studied under Wolf, and in 1873 he received the Michael Beer prize for sculpture, the first American to obtain that distinction. He then went to Rome, where he continued to reside. His first large work was a group representing "Religious Liberty" (1874), which is now in Fairmount Park, Philadelphia. Among other works by him are the much-discussed "Christ," Peabody Institute, Baltimore; "The Daughter of Eve"; "Judith," Cincinnati Museum; a Madonna for a church in Tivoli; 11 statues of famous artists for the Corcoran Gallery, Washington; the Jefferson Monument in Louisville, Ky.; "Eve," exhibited at the St. Louis Exposition in 1904; "Apollo and Mercury," in Berlin; a statue of "Faith," in the cemetery at Rome; a "Homer" group, at the University of Virginia; "Virginia Mourning her Dead," at Lexington, Va.; and "Napoleon at St. Helena." His portraits, in the round and relief, include those of Liszt, Cardinal Hohenlohe, Longfellow, Lee, Farragut, and the statue of Mrs. Andrew D. White, at Cornell University. The work of Ezekiel is little known in this country, for the best of it remains abroad, but by his initial exhibit at the Centennial in 1876 he helped to destroy the prevailing classicism of American sculpture by introducing German and new Italian methods. His work departs from the conventional standard in many cases, is original in sentiment, and clever in workmanship. It shows the influence of Michelangelo rather than of the Greek models, although such works as "Consolation," "Pan and Cupid," and "Apollo and Mercury" are classical in tendency. He received many medals, the order of Pour le Mérite in art from the Emperor of Germany, and was knighted by the King of Italy.

EZION-GEBER, *é'zî-ôn gē'bēr* (Heb., where Geber trees grow). A station of the Israelites on their road from Egypt (Num. xxxiii. 35; Deut. ii. 8). It was originally a city of Edom, which David conquered (2 Sam. viii. 14). Later it was the station of Solomon's navy, which was engaged in the gold trade with Ophir (1 Kings ix. 26; 2 Chron. viii. 17); when Jehoshaphat fitted out ships for a similar purpose, they were broken at this port (1 Kings xxii. 48; 2 Chron. xx. 36-37). Josephus (*Ant.*, viii, 6, 4) says the place was called Berenice in his day. Ezion-Geber is probably identical with the modern Ain-el-Ghudyan, where is now the dry bed of the Arabah near Elath (q.v.). Consult Musil, *Arabia Petraea II: Edom* (Vienna, 1908).

EZ'RA (perhaps shortened from *Azariah*, Yahwe helps). A prominent figure in Jewish history, living in the Achæmenian period, leader

of a band of exiles returning from Babylonia, legislative writer, and reformer. Little is known concerning his private life. He belonged to a priestly family and resided in Babylon in the reign of a king whose name is given as Artaxerxes. It is not certain whether Artaxerxes I (405-425 B.C.) or Artaxerxes II (404-359 B.C.) is meant. Most scholars think the former, but there is much to be said in favor of the latter. With Artaxerxes Ezra seems to have been in considerable favor, and he obtained permission to return to Jerusalem with a company of his countrymen, 1754 in number. Ezra was authorized to carry offerings to the temple made by the King and by the Jews who remained in Babylonia, to purchase sacrificial animals, and to use the rest of the money that was given to him as he saw fit. He is also represented as the "writer of the law of the God of heaven" (Ezra vii. 21) and is said to have been instructed and given power to carry out the laws of the Persian King and the law of God. The more commonly accepted date for his departure from Babylonia is 458 B.C., but it is not impossible that it was 398 B.C.

Ezra, on his arrival in Palestine, found the Jewish population, priests and Levites included, contracting marriages with foreign women. To one profoundly impressed with the fundamental principle that Yahwe's people must remain pure, such a state of affairs was intensely distressing. The question was taken up in an assembly of the people held in the year when Ezra arrived; and a commission of inquiry was appointed which drew up a list of persons who had entered upon mixed marriages. Nehemiah (q.v.), who had been governor in the time of Artaxerxes I, apparently from 445 to 433, had strongly objected to the mixed marriages, but without insisting upon their dissolution, had urged sabbath observance, rest for the land in the seventh year, and the payment of tithes, and had pledged the people to certain reforms (Neh. x). But Ezra went further. He forced the Jews who had married foreign women to divorce their wives, and he laid the foundation for a more accurate fulfillment of the will of Yahwe by presenting to the whole people on a solemn occasion the law of Moses. Most scholars are of the opinion that this event took place in the year 444 B.C. and is the one described in Neh. viii-x, where Ezra is pictured as gathering the people on the plateau before the Water Gate and reading to them the Book of the Law. It is possible, however, as some scholars think, that the assembly was held in 397; Nehemiah's name does not seem to have occurred originally in Neh. viii. 2, as it is not found in 3 Esdras ix. 49; and Neh. x appears to relate to a pledge given by the community, while Nehemiah was governor, before the time of Ezra. The impressive scene is described in detail. Two days are consumed in the reading. The men of Judah are profoundly impressed, and portrayed as moved to tears at the thought of their past disobedience. Preparations are at once made to carry out the law, and as a symbol of repentance a great fast is held. There is no reason to doubt that Ezra used some of his time in Jerusalem in preparing an elaborate code, and that this code was promulgated on the occasion described. How extensive the law book was, and whether all of it was read, cannot be determined. Some scholars think that practically all of our present Pentateuch was read; others

maintain that only those sections to which the name of the Priestly Code has been given were read. There is reason to doubt, however, that any such code ever existed as a separate document; and it is not necessary to suppose that all the narratives, or even all the legal enactments, were publicly read. Exactly what part Ezra had in the production of the Pentateuch cannot be ascertained from the phrase designating him as "the writer of the law." That may mean anything, from mere copying to absolute authorship. According to a plausible theory it implies that Ezra wrote out a copy of the law more complete than any existing before his time, as various glosses, notes, and longer additions of different nature, which had grown up in the reading of the groundwork, were inserted in it. (See PENTATEUCH.) The new law book was formally recognized, and the temple service was regulated according to its prescriptions. Naturally not all the laws were carried out or could be, and it is doubtful whether at any time in the history of Israel all the pentateuchal regulations were adhered to in their detail; but what is important to note is that Ezra gave the strongest impetus to those tendencies which led to a conception of Judaism as identical with the observance of canonical minutiae. Though the word "writer" does not have exactly the same connotation as the later "scribe," Ezra may be regarded as the forerunner of the rabbis who in the succeeding centuries took the place of the priests, and as students and interpreters of the law became, until recent times, so characteristic a feature of Judaism. Consult: Van Hoonacker, *Zorobabel et le second temple* (Ghent, 1892); Kosters, *Het herstel van Israel in het Perzische tijdvak* (Leiden, 1894); Bertholet, *Ezra und Nehemia* (Tübingen, 1902); id., in *Die Religion in Geschichte und Gegenwart* (ib., 1910); Torrey, *Ezra Studies* (Chicago, 1910); Herford, *Pharisaism* (New York, 1912).

EZRA, BOOK OF. A record of portions of Jewish history after the Babylonian exile. It originally formed in the Jewish canon one book with Nehemiah, bearing the name of Ezra. This book is supposed to have been compiled by the author of Chronicles from various documents, such as: (a) the memoirs of Ezra and Nehemiah; (b) accounts of the building of the temple at Jerusalem in the reign of Darius; (c) copies of a correspondence in Aramaic with Artaxerxes I and Darius I and of Ezra's firman; (d) lists of heads of priestly and Levitical families; (e) lists of returned exiles—to all of which sources the editor has made additions of his own. In the Greek version the two books are still one and are called Esdras B, while Esdras A, or 3 Esdras, is essentially another, and possibly older translation. (See ESDRAS, BOOKS OF.) In the early printed Hebrew Bibles Ezra was still used as a heading for both, but the distinction is now made universally between Ezra and Nehemiah.

A division of the Book of Ezra into two parts suggests itself, the first of which (chaps. i-vi) contains: (1) the decree of Cyrus, dated in the first year of his reign and giving permission to the Jews to return to their own land and rebuild their temple; (2) the record of his restoration of the sacred vessels of silver and gold which Nebuchadnezzar had taken from the temple and brought to Babylon; (3) the return of a portion of the people and the com-

mencement of the work; (4) the obstacles placed in their way, chiefly by the Samaritans, in consequence of the refusal of the Jews to allow them to share in the work; and (5) the interruption of the work till the second year of Darius Hystaspes, who, having found the decree of Cyrus, confirmed it and gave the Jews additional privileges and help by which they were enabled to complete their temple in the sixth year of Darius and to reestablish divine worship. This part thus comprises the history of the Jews from 538 to 516 B.C. The second part (chaps. vii-x) contains: (1) the decree of Artaxerxes, giving Ezra authority to proceed to Jerusalem with all Jews who wished to accompany him, and an account of the large sums of silver and gold added by the King and his counselors to the free-will offerings of the people, and his order to his treasurers in the provinces intervening between Babylon and Jerusalem to furnish the expedition liberally with needed supplies; (2) the arrival of Ezra, accompanied by 600 chief men and 200 priests and Levites; and (3) the measures taken by Ezra for the suppression of mixed marriages. This part is supposed to refer to events taking place in 458 and 445 B.C., or if Artaxerxes II is meant, most likely in 397 B.C. (See EZRA.)

It is generally recognized that the historical value of the narratives in this book depends upon the character of the sources used by the author of Chronicles rather than upon anything that comes from his hand, and also that the work has suffered from various transpositions in the text, often indicated by the more correct arrangement in 3 Esdras. While it is not so universally admitted as in the case of the memoirs of Nehemiah, the majority of scholars believe that in Ezra vii. 27-ix. 15, and probably also in Ezra x, Neh. vii. 73 b-ix. 37, Memoirs of Ezra have been used, and that there is no reason to doubt the accuracy of his statements. The story of the return under Cyrus was questioned by Kisters and other scholars, but there is a disposition at present to assume that permission was given by Cyrus and that a small number availed themselves of it. Haggai, Zech. i-viii, and Neh. i. 2 ff. still render it difficult to think of large numbers returning in 538 and an attempt then to rebuild the temple. Since Eduard Meyer's defense of the Aramaic decrees in 1896 and the discovery of the Elephantine papyri (q.v.), which come from the fifth century and refer to Johanan the high priest and the sons of Sanballat of Samaria, the authenticity of the decrees of Cyrus, Darius, and Artaxerxes, as well as the Aramaic correspondence in general, has been more widely accepted than formerly. It should be noted, however, that Torrey has recently adduced important evidence that the language of the whole Aramaic section is of a considerably later type than that of the Elephantine documents, and numerous analogies showing that the production of letters and decrees was regarded as a legitimate method of historic composition. Van Hoonacker held on strong grounds that Nehemiah preceded Ezra, the former leaving Susa in 445, the second Babylon in the seventh year of Artaxerxes II (397 B.C.). Torrey and Schmidt gave various reasons for regarding Artaxerxes II as Nehemiah's King. In view of the Elephantine records this can be maintained to-day only if there were two Sanballats, which is not impossible, but cannot be proved. On the whole Van Hoonacker's

opinion commends itself. Nehemiah's visits to Jerusalem would then be in 445 and 433, and Ezra's in 397. Bertholet has pointed out that Ezra at his arrival evidently found no governor in Jerusalem, while Nehemiah refers to a number of governors before him in such a manner as to make it clear that Ezra was not among them (Neh. v. 15), that Ezra presupposes the repairs and the rebuilding of the wall which was accomplished by Nehemiah (Ezra ix. 9), that Nehemiah's name did not originally occur in Neh. viii. 9, as the parallel passage in 3 Esdras shows, and that Neh. x has to do with the pledge taken by Nehemiah from the people that they would enforce certain reforms, and not with the introduction of the law by Ezra. As to the lists of the returned exiles, in the time of Cyrus (Ezra ii and Neh. vii), there is a tendency among scholars to regard them as in reality giving a census of the "children of the province" in the sense of citizens in the time of Nehemiah or Ezra. The attitude of scholars towards the Greek text designated by the early Church as Esdras A, but called 3 Esdras in the Vulgate, is undergoing a change. The older view of Grotius, Whiston, Ewald, and Lagarde has been reaffirmed by Howorth and Torrey, who have presented weighty reasons for believing that the earliest Greek version has been preserved in 3 Esdras. In this version Ezra iv. 5 is immediately followed by v. 1, and Neh. vii. 73 b-viii. 13 a immediately follows Ezra x. 44. It has long been felt that the correspondence with Artaxerxes (Ezra iv. 6-23) in the Masoretic text is out of place; and that the reading of the law (Neh. vii. 73-ix. 37) in reality belongs to the Book of Ezra. As 3 Esdras ends in the midst of Neh. viii. 13, it is a matter of conjecture how much of what follows this verse preceded Neh. i. 1. Bertholet plausibly argues that the list of those who entered into an agreement and the pledge they gave not to marry foreign women, to keep the sabbath, etc., in Neh. x, originally had its place after the reference to this pledge in Neh. xiii. According to Torrey the translator found in his Aramaic text the story of the three pages and Darius, which consequently was an early interpolation. That the Chronicler used his sources for this period with as much freedom as those he employed for earlier times (see CHRONICLES) is generally recognized, but there is still a difference of opinion as to the extent of his work. See also NEHEMIAH, BOOK OF. Consult: Schrader, in *Theologische Studien und Kritiken* (Vienna, 1867); Smend, *Die Listen der Bücher Ezra und Nehemia* (Basel, 1881); Van Hoonacker, *Néhémie et Esdras* (Ghent, 1890); id., *Néhémie en l'an 20 d'Artaxerxes I et Esdras en l'an 7 d'Artaxerxes II* (ib., 1892); Kisters, *Het Herstel van Israël in het Perzische Tijdvak* (Leiden, 1894); Ed. EZZELINO, ɛt'se-lɛ'nò, or **ECCELINO**, **DA ROMANO**. An Italian Ghibelline family.—The first Ezzelino was a German cavalier who settled in Italy at the time of the Hohenstaufen dynasty and gained possession of the castle of Romano; hence the name.—Ezzelino II was, against all the family traditions, a Guelph. He lived about 1180.—His son, Ezzelino III, was podestà of Vicenza until a Guelph success (1194) caused his downfall. With the protection of the Emperor, Otto IV, he regained his position, but finally abdicated (1215).—Ezzelino IV (1194–1259), his son, the most celebrated of the family,

became podestà of Vicenza upon the abdication of his father and directed all his energies against the enemies of his house. He established his capital at Padua, and by the victory of the Emperor Frederick II at Cortenuova (1237) became master of northern Italy from Milan to the Adriatic. After the death of Frederick II he acted as an independent prince. His cruelty and impiety, which gain him mention in Dante's *Inferno*, caused him to be excommunicated in 1252, and the Lombard cities made a league against him which he could not resist. He was taken prisoner in 1259 and died of voluntary starvation. His brother and all his family were murdered. Consult Stieve, *Ezzelino von Romano* (Leipzig, 1909).

F The sixth letter and fourth consonant in the Græco-Roman alphabet. The Phœnicians called the letter *vau* (or *wau*). This has usually been supposed to mean a nail or peg. As the Hebrew is the only Semitic tongue in which *vau* occurs as a word, it is probable that the name of this letter was not originally a word, but merely the sound of *u* or *w*. Some authorities hold that the top-stroke F is merely a modification of the consonant E, having no relation with the symbol *vau*. Flinders Petrie (*The Formation of the Alphabet*, London, 1912) states that the symbol F was a common sign in Asia Minor and has a long history in Egypt. According to this same authority it passed to Crete and Phylakopi, but was avoided by most of the Greeks, appearing solely at Corinth and Elis under the name *digamma*, which arose from a fancied resemblance to a pair of gammas (*F*). From Greece it passed into Italy, from which it was inherited by modern Europe. It should be noted that the value of the Greek symbol was the bilabial voiced sound of *w*, and not the labiodental voiceless sound of our modern F. Already in the second century of the Christian era the cursive capital *f* made its appearance, of which our small *f* is an outgrowth. There is, furthermore, a mid-stroke symbol, *ʃ* or *ʒ*, also found in ancient Egypt, which has been preserved notably in Etruscan, the Runic Inscriptions, and at Elis in Greece, but was finally driven out by the top-stroke form. See ALPHABET; LETTERS.

Phonetic Character. F is pronounced by joining the lower lip and the upper teeth, and it is a labiodental voiceless aspirate. Its corresponding voiced labiodental is *v*. Latin *f* was practically the same sound as English *f*, and was not like the Greek *φ*, which was distinctly a double sound (*p* + *h*), pronounced as in *top-heavy*. Under certain circumstances *f* may take the place of any of the mutes. Original *bh*, *gh*, and *dh* (in English *b*, *g*, *d*) may be represented by Latin *f*, as Skt. *bharati*, 'he bears,' Lat. *fert*, Eng. *bears*; Skt. *gharmas*, Lat. *formus*, Eng. *warm*. English *f* represents (1) an original *p*: Skt. *pitar*, Eng. *father*; Skt. *pāda*, Eng. *foot*; (2) a guttural: Lat. *quatuor*, Eng. *four*; Lat. *quinque*, Eng. *five*. The pronunciation of gutturals has a tendency to lapse into the easier sound; cf. *cough*, *laugh*, pronounced as if spelled with an *f*. Anglo-Saxon *f* sometimes disappears in modern English, e.g., *wif-man*, and *hlāford*, now *woman* and *lord*.

As a Symbol. F, in music, is the fourth

note of the natural diatonic scale of C and stands in the treble clef in the first space or in the fifth line; in the bass clef it stands on the fourth line or in the first space below. In chemistry F = fluorine. F as a mediæval Roman numeral stands for 40; with a bar above F it is 40,000. In algebra it serves as the sign of an operation in general, and particularly of a function having a differential coefficient. As an abbreviation, it stands for *Fellow* (in *F. R. S.*, etc.), in *fisheries* for *full fish*, in physics for *Fahrenheit*, and in a ship's log book for *fog*.

FABELL, PETER. A personage born and buried at Edmonton, Middlesex, England, mentioned as having died during the reign of Henry VII (1485-1509). He was said to have sold his soul to the devil, and after him is named the chief character in the once popular play *The Merry Devil of Edmonton*.

FABER, fä'bär, CECILIA BÖHL VON. See CABBALLERO, FERNÁN.

FABER, fä'bër, FREDERICK WILLIAM (1814-63). An English theologian. He was born at Calverley, Yorkshire; studied at Harrow and at Balliol College, Oxford, where he became an enthusiastic admirer of John Henry Newman; and was ordained priest in 1839. After some years spent in traveling on the Continent, and having published a *Life of St. Wilfrid* (1844), he became a convert to the Roman Catholic church (1845) and founded the Wilfridians, or Brothers of the Will of God, at Birmingham. This community was ultimately merged in the Oratory of St. Philip Neri, of which Newman was the head, and over a branch of which, established in London in 1849, Faber presided till his death. Pope Pius IX in 1854 made him a D.D. He published lives of the saints and a number of theological works, but it is mainly as a writer of fervent and graceful hymns that he will be remembered. He wrote "O Gift of Gifts, O Grace of Faith," "Paradise, O Paradise," and other hymns in familiar use even in Protestant churches. Consult the *Life and Letters* (London, 1869; new ed., 1888) by Father Bowden.

FABER, fä'bër, FREDERIK (1795-1828). A Danish zoölogist. He was born at Odense on the island of Fünen, and graduated in law in 1818. From early youth he displayed a great interest in zoölogy and published his first book on that subject in 1815, under the title *Indledning til Dyrelæren til Brug ved den Naturhistoriske Undervisning*. From 1819 to 1821 he traveled through Iceland, and he published his investigations in a work of permanent value. en-

titled *Ueber das Leben der hochnordischen Vögel Islands* (1825-26). His other works include: *Prodromus islandischer Ornithologie* (1822), with the supplement entitled *Nachtrag zur islandischen Ornithologie* (1824); *Naturgeschichte der Fische Islands* (1829); and numerous contributions to Oken's *Isis* and the periodical entitled *Tidsskrift for Naturvidenskaberne*. His name has been applied to several zoölogical species.

FABER, GEORGE STANLEY (1773-1854). A learned divine of the Anglican church. He was the eldest son of the Rev. Thomas Faber and was born at Calverley, Yorkshire, Oct. 25, 1773. He entered University College, Oxford, in 1789. In 1796 he took his degree of M.A., was Bampton lecturer for 1801, and in 1805 became vicar of Stockton-on-Tees, Durham. After several changes he received from Bishop Van Mildert, in 1832, the mastership of Sherburn Hospital, near the city of Durham, where he died, Jan. 27, 1854. His management of the hospital estates was very judicious and successful. Faber wrote upward of 40 works, several of which enjoyed an extensive popularity, but have little permanent value. His theories of idolatry and his interpretations of prophecy are fanciful. The principal are: *The Genius and Object of the Patriarchal, the Levitical, and the Christian Dispensations* (1823); *The Difficulties of Infidelity* (1824); *The Difficulties of Romanism* (1826; 3d ed., 1853); *The Sacred Calendar of Prophecy* (1828); *The Primitive Doctrine of Election* (1830); *The Primitive Doctrine of Justification* (1837); *Eight Dissertations upon the Prophetic Promises of a Mighty Deliverer* (1845). Consult the memoir by F. A. Faber in G. S. Faber's posthumous *Many Mansions in the House of the Father* (1854).

FABER, fá'bár', or FABRI, JACQUES LÉFÈVRE D'ESTAPLES, Lat. JACOBUS STAPULENSIS (c.1450-c.1536). A French Roman Catholic, one of the first scholars and exegetes of his time. He was born at Estaples (Étaples), near Boulogne, about 1450. He studied at the University of Paris and became professor in the College of Cardinal Lemoine. He visited Italy, studying Aristotle with the Italian humanists. When his former pupil, William Briconnet, became abbot of the Parisian Benedictine Abbey of Saint-Germain-des-Prés in 1507, he secured for Faber a home there, which he retained till 1520. Then he became director of the leper hospital at Meaux. His works were obnoxious to some of the church authorities, but he was safe from molestation under the King's authority till Francis I was taken prisoner at Pavia in 1525. Faber was then formally condemned, and his works were suppressed. He fled to Blois and to Guienne, or, according to some accounts, to Strassburg. On the return of Francis such proceedings were stopped, and he was made tutor of the King's children and royal librarian at Blois. When the Princess Margaret became Queen of Navarre, she received Faber in her city of Nérac, and there he passed his old age in quiet. He died there in 1536. Among Faber's works were the *Physics*, *Metaphysics*, and *Ethics* of Aristotle, and a psalter in five languages. In 1512 he issued a translation into French of the Epistles of St. Paul, in 1523 of the whole New Testament, in 1528 of the Pentateuch, and in 1530 of the entire Bible. These translations were from the Vulgate, with reference, however, to the originals, and corrections

where Faber deemed them necessary. He also added short notes and comments, in which there were some indications of Protestant leanings. Faber's work has been the basis of all subsequent French versions. For his life, consult De Labatier Plantin (Montauban, 1870) and Prossdij (Leyden, 1900).

FABER, fá'bér, JOHANN LOTHAR VON (1817-96). A German manufacturer. He was the proprietor of a small lead-pencil manufactory at Stein (Bavaria), which he enlarged to international proportions. He established offices in Berlin, Paris, London, and New York, and additional manufactories at Geroldsdgrün (Upper Franconia, Bavaria), Noisy-le-Sec, near Paris, and New York (with cedar yard and mills at Cedar Keys, Fla.). To the manufacturing of lead pencils he added that of all sorts of writing, drawing, and painting materials. He received a patent of nobility and an appointment as counselor of state for his services to German industry.

FABER, or FABRI, fá'bré, JOHANNES (1478-1541). A Roman Catholic bishop, called the "Hammer of Heretics." His family name was Heigerlin, which he changed to Faber. He was born at Leutkirch, near Lake Constance, in 1478. He studied theology and canon law in Tübingen and Freiburg in Breisgau and became doctor in canon law. After parochial and cathedral service he was appointed in 1518 vicar-general of the diocese of Constance. He enjoyed the friendship of such men as Erasmus, Melancthon, and Zwingli, and seemed likely to agree with them fully. But when the breach with the church became too wide, he chose the side of the latter, and in 1522 issued a work against Luther, and ever afterward was one of the most indefatigable, learned, and formidable opponents of the movement. His epithet comes from his work *Malleus in hæresim Lutheranam* (Cologne, 1524), but it is only one of many such writings. At the last disputation in Zurich (January, 1523) and the diets of Nuremberg (1523), Speier (1529), and Augsburg (1530), he bore a leading part and won general applause. In 1531 he became Bishop of Vienna, and in this exposed position the Turks gave him as much to do as the Reformers. He died at Baden, near Vienna, May 21, 1541. His collected works, so called, but really only the homiletical, appeared in Cologne (3 vols., 1537-41). The polemical works, *Opuscula Quædam J. Fabri Viennensis* (Leipzig, 1537), are more valuable. There is no complete biography of him. A. Horawitz, in his *Johannes Heigerlin genannt Faber, Bischof von Wien, bis zum Regensburger Convent* (Vienna, 1884), traced his life to 1524 only. Consult Janssen, *History of the German People*, vol. xiv (Eng. trans., London, 1909).

FABER, JOHN, the elder (c.1660-1721). An English draftsman and mezzotint engraver. He was born at The Hague and settled in England probably in 1698. He was especially celebrated for the small pen portraits on vellum which he drew from life. One of the finest examples of this kind is the portrait of Simon Episcopius in the British Museum. In 1712 Faber was employed at Oxford and at Cambridge to engrave a set of 45 portraits representing the founders of the colleges. Other portraits engraved by him from life are those of Bishop Atterbury, Count Bothmer, John Caspar, Dr. Sacheverell, and Bishop Hough. Though some-

what stiff in execution, his mezzotints are much prized.

JOHN FABER, the younger (c.1695-1756), a mezzotint engraver, studied under his father and at Vanderbank's Academy, London. His work consists chiefly of portraits, of which more than 400 have been preserved. These include plates of Ignatius Loyola (after Titian), Charles II (after Lely), Carreras (after Sir Godfrey Kneller), and the series of the "Beauties of Hampton Court" and "The Members of the Kit-Cat Club" (also after Kneller). Among the engravings of his which are not portraits are "St. Peter" (after Van Dyck) and "The Taking of Namur" (after Wyck). His works exhibit a high degree of excellence and, when arranged chronologically, a constant improvement in technique. They represent admirably the English manner of portraiture characteristic of the period immediately following Kneller.

FABER, PIERRE (1506-46). See LEFÈVRE.

FABIAN. Bishop of Rome (236-250), reckoned as the twentieth Pope. He fell as one of the first martyrs in the Decian persecution after an efficient pontificate.

FABIAN GENS. See **FABIUS**.

FABIAN SOCIETY, THE. An organization for the advancement of Socialism. Thus far it has been the most important socialistic society in England. It started in London, but similar organizations are now found in many other cities. In 1883 an American, Thomas Davidson, who chanced to be in London, held parlor conferences with a group of literary workers chiefly, on the social duties of the times. This group continued to hold informal conferences. Socialistic theories gradually gained the upper hand in one section, and it finally became definitely socialistic. The name of the society, derived from that of the Roman general Fabius, who saved the state by his policy of delay, indicates the tactics of the party, the support of meliorative tendencies instead of revolutionary tendencies. In 1888 the society began holding public meetings. The addresses have since been published as the *Fabian Essays* (Amer. ed., Boston, 1894). The society carries on an active propaganda through the press, free lectures, etc. It seeks the nationalization of land and of such industries as can be "conveniently managed socially." Rent and interest must be added to the reward of labor. The idle class must disappear and practical equality of opportunity be gained. Consult: G. B. Shaw, *The Fabian Society* (London, 1892); Edouard Pfeiffer, *La Société fabienne et le mouvement socialiste anglais contemporain* (Paris, 1911). See **SOCIALISM**.

FABII, fā'bī-i, ARCH OF THE. An arch on the Sacra Via, at the entrance to the Roman Forum, erected by Quintus Fabius Maximus Allobrogicus, about 120 B.C., to commemorate his campaign against the Arverni and the Allobroges. The only remains are a few blocks of travertine discovered in 1882 near the site of the arch, which appears to have been small and of very simple architecture. Consult Platten, *The Topography and Monuments of Ancient Rome* (2d ed., New York, 1911).

FABIUS. The name of one of the oldest and most illustrious patrician clans of Rome. This family claimed descent from Hercules and a daughter of Evander. (See **LUPECALIA**.) Three brothers of this clan—Quintus, Marcus, and Kæso Fabius Vibulanus—alternately held the office of consul for seven years (484-479 B.C.).

In 479 the Fabii, under Kæso **FABIUS VIBULANUS**, migrated to the banks of the Cremera, a small stream that flows into the Tiber a few miles above Rome. Here, two years after, they were decoyed into an ambushade by the Veientes, with whom they had been at war, and, with the exception of one member, Quintus Fabius Vibulanus, through whom the race was perpetuated, the entire gens, consisting of 306 men, was put to the sword. The most eminent of the Fabii were **QUINTUS FABIUS RULLIANUS**—supposed to have been the first who obtained for himself and his family the surname of *Maximus*—and his descendant, **QUINTUS FABIUS MAXIMUS VERUOCOSUS**, named **CUNCTATOR**, 'the delayer.' The former was the most eminent of the Roman generals in the second Samnite War (c.326-304 B.C.) and was twice dictator and six times consul. At Sentinum, in 295 B.C., he defeated the Samnites and their allies. (See **ROME, History**.) The latter, who, in the course of his career, was five times consul and twice censor, was appointed dictator immediately after the defeat of the Romans by Hannibal at Lake Trasimenus, in 217 B.C. The peculiar line of tactics which he observed in the second Punic War obtained for him the surname by which he is best known in history. Hanging on the heights like a thundercloud, to which Hannibal himself compared him, and avoiding a direct engagement, he tantalized the enemy with his caution, harassed them by marches and countermarches, and cut off their stragglers and foragers, while at the same time his delay allowed Rome to assemble her forces in greater strength. This policy—which has become proverbial as "Fabian policy"—although the wisest in the circumstances, was appreciated neither in the camp nor at home; and shortly after, Marcus Minucius Rufus, master of the horse, was raised to an equal share in the dictatorship—a position, however, which he occupied for but a short time. At the end of six months, the legal period for holding the dictatorship, Fabius laid down the office. The consuls took command, and the defeat at Cannæ (q.v.) followed (216 B.C.). During his fifth consulship (c.210 B.C.) Fabius recovered Tarentum, which had long been one of Hannibal's important positions. He died in 203 B.C.—**C. FABIUS**, surnamed **PICTOR**, executed upon the walls of the temple of Salus (dedicated by the dictator C. Junius Brutus Bubulus in 302 B.C.) the earliest Roman paintings of which we have any record; and his grandson, **QUINTUS FABIUS PICTOR**, was the first writer of a Roman history in prose; he used Greek, Latin not yet being fit for prose writing. Fabius' work was much used by later authors, including Livy. The fragments of his *Annals* may be found in Peter, *Historicorum Romanorum Fragmenta* (Leipzig, 1883). **Q. FABIUS MAXIMUS ALLOBROGICUS** defeated the Allobroges in 121 B.C. (See **FABII**, **ARCH OF THE**.) Consult Peter, *Veterum Historicorum Romanorum Reliquiæ*, vol. i (Leipzig, 1870). On the Fabii in general, consult Du Rieu, *Disputatio de Gente Fabia* (Leiden, 1856); Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. vi (Stuttgart, 1909).

FABIUS, THE AMERICAN. A name applied to Washington because, like Fabius Cunctator, he followed a policy of avoiding pitched battles, particularly in the campaigns of 1776 and the winter of 1778.

FABIUS, THE FRENCH. Anne, Duc de Montmorency, Grand Constable of France (c.1492-

1567), so called from his policy of delay in Provence in 1536.

FABLE (ME. *fable*, from OF. *fable*, *fauble*, from Lat. *fabula*, narrative, from *fari*, to speak; connected with Lat. *fama*, fame, Gk. *φήμι*, *phemi*, I say, Skt. *bhānati*, he says). A word of twofold signification. First, it is employed by some writers in a general sense to denote any fictitious narrative, as, e.g., the incidents in an epic or dramatic poem. At one time, also, when the myths of the Greeks and Romans were thought to be satisfactorily accounted for by regarding them as conscious inventions of the ancient poets and priests, it was customary to speak of them as *fables*, but this application of the term is now abandoned by scholars. (See MYTH.) According to the second and more frequent signification of the word, it denotes a special kind of literary composition, either prose or verse, in which a story of some kind is made the vehicle for conveying a universal truth. It differs from a parable in this respect, that, while the latter never transcends in conception the bounds of the probable or the possible, the former always and of necessity does. The peculiarity of the *structure* of the fable consists in the transference to inanimate objects, or, more frequently, to the lower animals, of the qualities of rational beings. By the very novelty and utter impossibility of the representation the interest of the hearer or reader is excited, and thus its symbolic meaning and moral become transparent to him, at least if the fable is well contrived. The ancient fabulists were simple, clear, and earnest in their representations. They seem to have sprung up in the East, and India was in all probability their home. From the rich collections of fables in the Sanskrit *Pancatantra* and *Hitopadesa* (q.v.) came, it would seem, the Æsopic beast stories. Other celebrated Oriental collections of fables, based directly upon the Sanskrit, are those of Bidpai (q.v.), or Pilpai, and of the Arabian Lokman. Among the Greeks the greatest name is that of Æsop (q.v.), whose fables at a much later period were versified by Babrius (q.v.). Among the Romans Phædrus cleverly imitated Æsop, but with considerable modifications, thus giving a certain amount of independent value to his work. It is perhaps worth mentioning here that the well-known fable of the *Town Mouse and Country Mouse*, told by Horace, is of purely Roman origin and is probably the only one in existence of which this can be affirmed.

Leaving the classical period, and before entering on the Dark Ages, we encounter the name of Aphthonius, who flourished in the early part of the fourth century, and who wrote indifferent fables in Greek prose; and still later, the name of Flavius Avianus, who composed 42, no better, in Latin elegiacs. During the Dark Ages the fable in various forms appears to have been cultivated in the monasteries, although nothing meritorious has survived; but later in the Middle Ages it acquired fresh life and vigor. In this form of literature the French have shown an undoubted superiority. From Marie de France, the most famous fabulist of the twelfth century, who claims to have translated her *Isopet* from the English, there has been a steady stream of fable literature unequalled in any other nation. The collection known as the *Roman de Renart*, which had the widest vogue all over Europe, makes its appearance in France between the twelfth and the fourteenth centuries. Many

collections of apologues were published in the sixteenth century, the most important of which being those of Guillaume Guéroult, Barthélemy Aneau, Gilles Corrozet, and Guillaume Haudent, while the poet Clément Marot was in several instances the immediate source of the great La Fontaine (q.v.). In the eighteenth century fable literature was produced in abundance by Dorat, Piron, Colardeau, and others. The most prominent of all was Florian, who ranks next to La Fontaine, but whose indebtedness to the master was very great. The oldest-known German fabulist is Stricker, who lived about the middle of the thirteenth century; but the famous *Reineke Fuchs*, or the History of Reynard the Fox (q.v.), goes in some of its numerous primitive forms much farther back in Germany. In the eighteenth century the fables of Gellert, Hagedorn, and Lessing, in his earlier style, are modeled directly on those of La Fontaine. However, in his *Fabeln*, published in 1759, Lessing sought to base his apologues on common sense, considering Phædrus and La Fontaine as mere perversions of the ideal contained in Æsop. In England the best known of the early examples of the apologue is found in Chaucer's *Nonne Prestes Tale*, which is but an enlargement of Marie de France's *Don Coc et don Werpiel*. Lydgate's *The Churl and the Bird* is another good example of the English apologue, while Gay takes precedence as the leading English fabulist. In Spain, Italy, and Russia the most important names are those of Yriarte, whose fables are still enjoyed because of their sprightliness and charm, Pignotti, and Krylov. Many of Andersen's wonder stories are fables, in which the weaknesses of human nature are treated with an exquisite humor and sarcasm, not inferior to those of La Fontaine.

The stories of Brer Rabbit and the other animals by Joel Chandler Harris (q.v.) do not belong under the fable proper, as they are not the invention of the writer, but are valuable records of the folklore (q.v.) of the African-Americans. The same is true of similar stories gathered from the Indian tribes.

Consult: Lessing, *Ueber das Wesen der Fabel* (1760); Robert, *Fables inédites des douzième, treizième, et quatorzième siècles, et fables de La Fontaine rapprochées de celles de tous les auteurs* (Paris, 1825); Loiseleur Deslongchamps, *Essai sur les fables indiennes et sur leur introduction en Europe* (ib., 1838); Bechstein, *Mythe, Sage, Märe and Fabel im Leben und Bewusstsein des deutschen Volkes* (3 vols., Leipzig, 1854-55); Benfey, *Pantschatantra* (ib., 1859); Schlenker, *Collection of Temne Traditions, Fables, and Proverbs* (London, 1861); Bleek, *Reynard the Fox in South Africa* (ib., 1864); Hervieux, *Les fabulistes latins depuis le siècle d'Auguste jusqu'à la fin du moyen âge* (5 vols., Paris, 1884-99); Weddigen, *Das Wesen und die Theorie der Fabel* (Leipzig, 1893); Hirsch, *Die Fabel* (Cöthen, 1894); Bieber, *Studien zur Geschichte der Fabel in den ersten Jahrhunderten der Kaiserzeit* (Munich, 1906); Levrault, *La fable, évolution du genre* (Paris, 1905); Revilout, "La fable en Egypte," in the *Revue des Questions historiques*, vol. lxxxii (ib., 1907); Plessow, *Geschichte der Fabeldichtung in England bis zu John Gay, 1726* (Berlin, 1906); Marchiano, *L'Origine della favola greca e i suoi rapporti con le favole orientali* (Trani, 1900); Archibald, *The Fable as a Stylistic Test in Classical Greek Literature* (Baltimore, 1912);

FABLE FOR CRITICS, A. A satirical poem by James Russell Lowell (1848), reviewing American writers and critics.

FABLIAUX, fa'blyo' (Fr., from OF. *fabliaus*, *fablet*, Prov. *fablet*, short story; connected with Lat. *fabella*, diminutive of *fabula*, story). Short stories in French octosyllabic verse, chiefly of the thirteenth century, frankly coarse, often brutal, usually comic and ironical, often cynically skeptical and bitter in their treatment of women, intensely satirical when describing the hypocrisy and vices of the weaker brethren of the clergy. They are realistic stories of everyday life, almost never touching upon the supernatural, and give a melancholy, possibly too dark, picture of national morals. They typify the *esprit gaulois* in their mocking disrespect for higher authority and their humorous treatment of salacious subjects. They appealed especially to the middle and lower classes, as a healthy reaction against the lackadaisical sentimentality of the *lais*, and have proved a storehouse to the novelists and dramatists of later times. Modern short-story writers are but the disciples of these early *jongleurs* (who both composed and recited the *fabliaux*) when they make everything subservient to the interest and climax of their story. From them Boccaccio, Chaucer, Shakespeare abroad, and in France the "nouvelles en prose" of the fourteenth to the sixteenth century (e.g., La Salle, Marguerite de Navarre), later even Molière, drew some of their best material. The best collection of them is the *Recueil général et complet des fabliaux des XIIIème et XIVème siècles*, by Montaiglon and Raynaud (6 vols., Paris, 1872-90). Consult: Bédier, *Les fabliaux* (ib., 1893); W. M. Hart, "The Fabliau and Popular Literature" in *Publications of the Modern Language Association of America* (Baltimore, 1908); Gaston Paris, *La littérature française au moyen âge* (XIe-XIVe siècle) (Paris, 1909).

FABRE, fi'br', FERDINAND (1830-98). A realistic French novelist, distinguished for his psychologic analysis of priestly character. Unable to follow his vocation, the priesthood, he devoted himself at first to descriptions of clerical life, as in *Les Courbezon, scènes de la vie cléricalle* (1862), whose minute analysis made him seem to Sainte-Beuve "a strong pupil of Balzac." Rustic sketches of his native southern France, as minute in their observation, followed. In this movement of "regionalism" tacitly asserting that Parisian life is not the only exclusively interesting aspect of French life, he easily proved himself to be a most powerful and inspiring factor. His most noteworthy novels are *Mon oncle Célestin: mœurs cléricales* (1881) and *L'Abbé Tigrane, candidat à la papauté* (1873), both clerical in subject and both translated into English. All his novels are directed, in one way or another, against ascetic pride and self-deception. They show a robust, healthy sympathy with life, a rather heavy playfulness, and a divination of the celibate clerical mind that is unique in this generation. Consult E. W. Gosse, *French Profiles* (London, 1905), and G. Pellissier, *Études de littérature contemporaine* (Paris, 1898).

FABRE, FRANÇOIS XAVIER PASCAL (1766-1837). A French painter, born at Montpellier. He was a pupil of David and won the Prix de Rome in 1787. Afterward he lived in Florence,

where he painted principally portraits and became professor at the Academy. It is supposed that he privately married the Duchess of Albany, the widow of the "Young Pretender," who at her death made him her sole heir. The collection of works of art she left him he added to considerably and bequeathed to the city of Montpellier to form the nucleus of the Musée Fabre. He also established a school of design at Montpellier in connection with the museum, and was himself its first director. Most of his works are at Montpellier. They include "Death of Abel," "Saul's Remorse," and a portrait of Canova. His "Neoptolemus and Ulysses" is in the Louvre. The paintings of Fabre are in the classical style and, though highly finished, are relatively good in color.

FABRE, HECTOR (1834-1910). A Canadian journalist. He was born in Montreal and was educated at L'Assomption and St. Hyacinthe Colleges, and at St. Sulpice College in his native city. He studied law and was called to the bar in 1856; but he relinquished the legal profession and entered journalism, becoming editor of *L'Ordre* (Montreal). In 1863-66 he edited the well-known *Le Canadien* (Quebec) and in 1869 founded *L'Événement* in that city. In 1873 he was an unsuccessful Liberal candidate for the House of Commons, but in 1875 he was appointed a member of the Dominion Senate. In 1882 he became resident agent in Paris for the Quebec and Dominion governments and resigned his seat in the Senate. In Paris he founded the French-Canadian journal, *Paris-Canada*. He was elected a fellow of the Royal Society of Canada and in 1886 was appointed a companion of the Order of St. Michael and St. George. His writings, especially the *Chroniques*, were remarkable for vivacity and wit. He published: *Esquisse biographique sur Chevalier de Lorimier* (1856); *Écrivains Canadiens* (1865); *Confédération, Indépendance, Annexion* (1871); *Chroniques* (1877).

FABRE, JEAN HENRI (1823-1915). A distinguished French entomologist, born at Saint-Léons, Aveyron. For some years he was a teacher in the Lycée of Avignon and professor of physics at the Collège of Ajaccio. He became a corresponding member of the Institute and a chevalier of the Legion of Honor. In retirement at Sérignan he produced his greatest work, *Souvenirs entomologiques* (10 vols., 1879-1907), which was crowned by the Institute. His works also include: *La science élémentaire* (1862-65); *Histoire de la bûche* (1866); *Notions préliminaires de physique* (1867-70); *Le livre d'histoire* (1868); *Les ravageurs* (1870); *Astronomie élémentaire* (1872); *Les auxiliaires* (1873); *Lectures scientifiques: zoologie* (1873); *Botanique* (1874); *Premiers éléments de physique* (1874); *De chimie* (1875); *De sciences naturelles* (1875); *Les serviteurs* (1875); *La plante* (1875); *L'Industrie* (1875); *Cours complet d'enseignement littéraire et scientifique* (1876); *Livre des champs* (1879); *Les inventeurs et leurs inventions* (1880); *Le vie des insectes* (1910). Parts of his writings have been published in English as *Insect Life*, trans. by the author of *Mlle. Mori* (1901); *The Life and Love of the Insect*, trans. by A. T. de Mattos (1911); *Social Life in the Insect World*, trans. by Bernard Miall (1913); *The Life of the Spider*, trans. by A. T. de Mattos (1913); *The Life of the Fly*, trans. by A. T. de Mattos (1913); etc.

FABRE, MARIE JOSEPH VICTORIN (1785-

1831). A French poet, born at Jaujac (Ardèche). The brilliant success achieved in his youth with his *Eloge de Boileau* (1805), crowned by the Academy, did not continue beyond a few years. He died practically forgotten. His works were collected (1844-45) by one of his pupils, J. Sabbatier. They include the best poems, *Discours en vers sur les voyages* (1807); *Eloge sur Pierre Corneille* (1808); *La mort de Henri IV* (1808); *Opuscules en vers et en prose* (1806); *Eloge de La Bruyère* (1810).

FABRE D'ÉGLANTINE, fá'br' da'glän'tên', PHILIPPE FRANÇOIS NAZAIRE (1750-04). A French dramatist, born at Carcassonne. He was an actor in his youth and did not establish himself in Paris until 1787. During the next seven years he produced 27 plays, the best known of which are *Le Philinte de Molière*, or *La suite du Misanthrope* (1790); *Le convalescent de qualité ou l'aristocrate* (1791), and *Les précepteurs*, a posthumous comedy (1799). He was an ardent Revolutionist, a friend of Danton and Desmoulins, and president of the Cordeliers. Sent as a deputy to the Convention, he voted for the death of the King. He was accused of corruption by his enemies and of moderation by Robespierre, and with Danton and Desmoulins was condemned and executed. The accusation was afterwards disproved. His *Ouvres mêlées et postumes* (2 vols.) were published in 1892 and his *Correspondance amoureuse* (3 vols.) in 1796 and a second edition in 1899.

FABRETTI, fá-brèt'tè, ARIODANTE (1816-94). An Italian antiquary. He was born at Perugia, and became professor of archaeology in the University of Turin in 1860 and director of the museum of Antiquities there in 1868. He was the author of *Corpus Inscriptionum Italicarum Antiquioris Aevi* (1867), and many works on the history and antiquities of Perugia. He was made a senator of Italy in 1889.

FABRETTI, RAFFAELE (1618-1700). A distinguished Italian antiquary and archaeologist, born at Urbino, in Umbria. While a student of law at Rome he was attracted to the study of the ancient ruins and from that time devoted himself as far as possible to classical and antiquarian research. Under Pope Alexander VII he became treasurer and subsequently auditor to the Papal Embassy at Madrid. After 13 years at Madrid he returned to Rome, taking advantage of his journey through Spain and France to become acquainted with the Roman remains in those countries. At Rome he was made judge. Later, after a short residence at the Papal Legation in Urbino, he returned once more to Rome and devoted himself to his favorite pursuits until he was appointed by Innocent XII keeper of the papal archives of the castle of St. Angelo—a post of great responsibility, which he held till his death. His more important works are: "De Aquis et Aquæ Ductibus Veteris Romæ," in Grævius, *Thesaurus*, vol. iv (1680); *De Columna Traiani Syntagma* (1683; 2d ed., 1790), containing also a discussion of the so-called *Tabula Iliaca* (q.v.); and *Inscriptionum Antiquarum Explicatio* (1699). His collection of inscriptions and monuments is deposited in the Ducal Palace of Urbino.

FABRI, fá'brè, FELIX (German name, *Schmid*) (?-1502). A German monk and author. He was lector in the Dominican monastery in Ulm, and made two voyages to the Holy Land—the first to Jerusalem (1480), and the second (1483), upon which he had entered as chaplain

to Johann von Waldburg, to Jerusalem and Mt. Sinai and thence by way of Cairo and Alexandria to Venice, where he arrived Jan. 8, 1484. After his return to Ulm he published an account of this tour, which is probably the most important work of the kind that appeared during the latter part of the Middle Ages. The German version was published in Feyrabend's *Reyssbuch des heiligen Lands* (Frankfort, 1584), the Latin version in vols. ii, iii, and iv of the *Bibliothek des litterarischen Vereins* (Stuttgart, 1843-49).

FABRI, FRIEDRICH (1824-91). A German Protestant theologian and promoter of colonization. He was born at Schweinfurt and was educated at Erlangen and Berlin. After holding several pastorates he was appointed director of the Missionary Society at Barmen in 1857. He retained this post until 1884, when he retired to Godesberg-on-the-Rhine, where he developed a beneficent activity as president of the Evangelical Society for the German Protestants in America. He was appointed to an honorary professorship at Bonn in 1889 and attracted attention by his numerous writings on religious subjects and on Germany's colonial policy, of which the most important are *Bedarf Deutschland der Kolonien?* (3d ed., 1884) and *Fünf Jahre deutscher Kolonialpolitik* (1889). His other literary works include: *Briefe gegen den Materialismus* (1856); *Die Entstehung des Heidentums und die Aufgabe der Heidenmission* (1859); *Die politische Lage und die Zukunft der evangelischen Kirche in Deutschland* (3d ed., 1874); *Staat und Kirche* (3d ed., 1872).

FABRI, JACQUES L. D'ESTAPLES. See **FABER**.

FABRI, JOHANNES. See **FABER**.

FABRIANO, fá'brè-à'nò. An episcopal city of Ancona, central Italy, 1066 feet above sea level, at the foot of the Apennines, 44 miles southwest of Ancona (Map: Italy, D 3). In the city hall and in several churches and private houses are paintings by the local school, of which Allegretto Nuzi (1308-85) was the head, followed by his pupil, Gentile da Fabriano (1370-1451). The paper and gunpowder manufactories of the city have been famous since the fourteenth century; it also manufactures parchment leather, and has trade in grain and cattle. Pop. (commune), 1901, 21,096; 1911, 23,752.

FABRIANO, GENTILE DA. See **GENTILE DA FABRIANO**.

FABRICE, fá-brès', GEORG FRIEDRICH ALFRED, COUNT (1818-91). A German soldier and statesman, born at Quesnoy-sur-Deule, France. In 1834 he entered the Saxon cavalry and by 1865 had become chief of the general staff with rank of major general. When Saxony joined Austria against Prussia in 1866, he was appointed chief of staff to the Crown Prince Albert, commander of the forces of Saxony in Bohemia. After the war, in October, 1866, he became Minister of War of Saxony. He acted as the representative of Saxony in the negotiation of the military convention with Prussia and reorganized the army of Saxony after the Prussian type. He took a prominent part in the Franco-German War, and in 1871, after the preliminaries at Versailles, which he largely conducted, he was in command of the German army of occupation in France and later in the same year was a second time appointed Minister of War of Saxony. He became Prime Minister of the Kingdom in 1876 and Minister for Foreign Affairs in 1882 and was made Baron in 1878 and Count in

1884. Consult Dittrich, *General von Fabrice* (Dresden, 1884).

FABRICIAN (fă-brîsh'an) **BRIDGE**. A stone bridge at Rome, joining the island of Æsculapius with the left bank of the Tiber, built by Lucius Fabricius in 62 B.C., to replace a wooden bridge dating from about 192 B.C. It is the only ancient Roman bridge that has endured. Of its four arches, one is hidden by the modern embankment. It is now the Ponte dei Quattro Capi. Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed., New York, 1911).

FABRICIUS, fă-brê'tsê-us, **DAVID** (1564-1617). A German theologian and astronomer, born at Esens, East Friesland. In 1584 he became pastor at Resterhaave and in 1603 at Osteel, where on May 7, 1617, he was murdered by a peasant whom he had accused from the pulpit of theft. The variable star Mira, in the constellation Ceti, was discovered by him (Aug. 3, 1596); and his astronomical and meteorological observations were of service to Kepler in the investigation of the planet Mars. In 1895 a monument was erected to his memory in the churchyard of Osteel.

FABRICIUS, fă-brîsh'ûs, **GAUS FABRICIUS LUSCINUS**. A Roman general and statesman of the fourth and third centuries B.C., who became for later ages a model of incorruptibility. He was consul in 282 B.C. and again in 278. In 282 he defeated the Bruttians and the Lucanians. He commanded in the war against Pyrrhus (q.v.). Tradition declared that, when, after the defeat of the Romans at Heraclea in 286, he was sent to treat for the ransoming of the prisoners, Pyrrhus sought to bribe him in order to gain a favorable peace, but that Fabricius scorned the bribe and made such an impression on the King that the Roman prisoners were immediately released. On another occasion the physician of Pyrrhus offered to Fabricius to poison his master; but, said the story, the upright Roman sent information of the treachery to the King, whereupon Pyrrhus again released all his Roman prisoners, in order not to fall behind in this contest of generosity. In 278 Fabricius concluded a peace with Pyrrhus, who left Italy. In 276 Fabricius was censor, together with Quintus Æmilius Papus, and as such carried out with great vigor the old Roman sumptuary laws. For victories over the Bruttians, the Lucanians, and the Samnites he was honored with a triumph. He died poor, and it is said that his daughter was aided by a grant from state funds.

FABRICIUS, fă-brê'tsê-us, **GEORG** (1516-71). A German scholar and Neo-Latin poet, born in Chemnitz, Saxony. He became rector of the College of Meissen in 1546, and in 1570 was appointed poet laureate by Maximilian II. He owes his reputation to his Latin poetry, published in *Poematum Sacrorum Libri XV* (1560). He also prepared an edition of the scholia to Horace (1555); he edited Terence (1548) and Vergil (1551). He wrote three elaborate works on Roman archæology, *Antiquitatum Libri II* (1549), *Itinerum Liber Unus* (1551), and *Roma* (1551). In his *Roma* he described the remains of ancient Rome and collected the references to them in Roman literature. He wrote also on the history of Saxony. Consult Baumgarten-Crusius, *De Georgii Fabricii Vita et Scriptis* (Meissen, 1839).

FABRICIUS, or **FABRIZIO**, fă-brê'tsê-ô,

GIROLAMO (1537-1619). An Italian anatomist and surgeon, commonly named, from his birth-place, Fabricius ab Aquapendente. He was the son of humble parents, who sent him to the University of Padua, where, in addition to the usual instruction in the classics, he studied anatomy and surgery under Fallopius. On the death of the latter, in 1562, Fabricius was appointed to fill the vacant professorship. He continued to hold this office for nearly half a century, during which period his high reputation for eloquence, general and professional knowledge, attracted students from all parts of the civilized world to Padua. Among these students was Harvey (q.v.), who derived from Fabricius' observations on the valves of the veins the first clew to his great discovery of the circulation of the blood. Fabricius was a most laborious student of comparative anatomy, from the standpoint of which he treated the eye, the larynx, the ear, the intestinal canal, the development of the fœtus, and many other subjects. The improvements which his knowledge of anatomy enabled him to introduce into the practice of surgery were very great; and his *Opera Chirurgica* (1617), which embraced every complaint curable by manual operation, passed through 17 editions. The Venetian Republic erected for him a spacious anatomical amphitheatre, gave him an annual stipend of 1000 crowns, and created him a knight of the Order of St. Mark.

FABRICIUS, Ger. pron. fă-brê'tsê-ûs, **JOHANN ALBERT** (1668-1736). A German classical scholar, born at Leipzig. He was professor of rhetoric and ethics at Hamburg from 1699 to his death. He stands preëminent among scholars for his two literary synopses, *Bibliotheca Latina* (3 vols., 1697, revised and improved by Ernesti, Leipzig, 1773), and *Bibliotheca Græca* (14 vols., 1705-28, revised by Harles, Hamburg, 1790), his greatest work. These two works give respectively the history of Latin and Greek literature; the *Bibliotheca Græca* is founded on a first-hand knowledge of every edition quoted and is the basis of every subsequent history of Greek literature. He published also: *Bibliotheca Latina Mediæ et Infimæ Ætatis* (5 vols., 1734), *Bibliotheca Antiquaria*, which gave the modern literature of classical antiquities (1731-36), and reëdited Banduri's *Bibliotheca Nummaria*, which gave the literature of numismatics (q.v.). He is known among theologians for his collections of the apocryphal and pseudepigraphical literature (1703 and 1713). Consult the biography by his son-in-law, H. S. Reimar, *De Vita et Scriptis J. A. Fabricii Commentarius* (Hamburg, 1737); Micéron, *Mémoires des hommes*, vol. xi (Paris, 1739); Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

FABRICIUS, **JOHANN** (1587-1615). A German astronomer. He was born in East Friesland, studied medicine at Wittenberg, and was afterward educated in astronomy by his father, David Fabricius. He appears also to have spent some time in Holland and to have obtained there for his father one of the earliest specimens of the astronomical telescope. In his famous work, *Narratio de Maculis in Sole Observatis et Apparente Earum cum Sole Conversione*, published at Wittenberg in 1611, he announces his discovery of the solar spots and of the rotation of the sun on its axis. In his letters to Marcus Velsorius (Markus Welser), not published until 1613, Galileo claims to have discovered the solar spots in November, 1610. It is

probable, therefore, that the honor of priority remains with Fabricius.

FABRICIUS, JOHANN (1644-1729). A German theologian, born at Altorf, near Nuremberg, and educated at Nuremberg, Helmstedt, and Altorf. In 1677 he became professor of theology at Altorf, and in 1697 at Helmstedt. In 1701 he was appointed abbot of Königsutter, and in 1703 counselor of the Consistory of the Dukedom of Brunswick. On comparative symbolism he wrote *Consideratio Variarum Controversiarum cum Atheis, Gentilibus Judæis, Mohammedanis, Socianis, Anabaptistis, Pontificiis, Reformatis* (1704; abridged ed., 1715), which so incensed the strict Lutherans that he was bitterly attacked on all sides. His *Gutachten* (1704), in which he recommended the Princess Elizabeth Christine of Brunswick to embrace Catholicism in order to be married to Charles of Spain (afterward the Emperor Charles VI), caused great scandal and brought about the dismissal of Fabricius from the university in 1709. His *Historia Bibliothecæ Fabricianæ* (1717-24) and *Amenitates Theologicæ* (1699) give much autobiographical information.

FABRICIUS, JOHANN CHRISTIAN (1743-1808). A German entomologist, born at Tondern in Schleswig. He studied at Copenhagen, Leyden, Edinburgh, Freiberg in Saxony, and Upsala, where he was a pupil of Linnæus. In 1775 he became professor of natural history at the University of Kiel. He developed a system for the classification of insects, based upon the structure of the mouth parts, which had an important influence upon the development of the science. His principal works are: *Systema Entomologica* (1775); *Philosophia Entomologica* (1778); *Supplementum Entomologicæ* (1797).

FABRICIUS HILDANUS, properly **WILHELM FABRY** (1560-1634). A German surgeon. He was born at Hilden, near Düsseldorf, and was educated at Cologne. After practicing at Lausanne and at Payerne (Canton of Waadt) he became physician of the city of Bern, where his great renown as a teacher and operator attracted students from all parts of Europe. Besides his work *Observationum et Curationum Chirurgicarum Centuriæ* (Lyons, 1641), he wrote: *De Gangræna et Sphacelo* (1593); *Lithotomia Vesicæ* (1626); and the treatise entitled *Kurze Beschreibung der Fürtrefflichkeit, Nutz und Notwendigkeit der Anatomey* (1624).

FABRIZI, fà-brèt'sè, NICOLA (1804-85). An Italian soldier and patriot, born at Modena. For taking part in the Modena insurrection of 1831 he was thrown into prison. Upon gaining his freedom he went to Marseilles, where he helped Mazzini organize the Savoy expedition. Later he fought in Spain on the Liberal side against the Carlists, and after this war he established himself at Malta. With Crispi he organized a revolution in 1848 and another uprising in 1860 in Sicily. In the latter year he united his forces with those of Garibaldi at Palermo, and under the latter's dictatorship he was Governor of Messina and Minister of War. In 1861 he aided Cialdini in the extirpation of brigandage and in 1866 he was Garibaldi's chief of staff. Later he became a member of the Italian national Parliament.

FABRONI, fà-brò'nè, ANGELO (1732-1803). An Italian biographical writer, born at Marradi, in Tuscany. He was educated at Faenza and Rome, and in 1773 was appointed tutor to the sons of Leopold, Grand Duke of Tuscany. His

most important works are: *Vitæ Italarum Doctrina Excellentium qui Sæculo XVII et XVIII floruerunt* (20 vols., 1778-1805); the *Laurentii Medicei Vita* (1748); the *Vita Magni Cosmi Medicei* (1788-89).

FABRONI, or FABBRONI, GIOVANNI VALENTINO MATTEO (1752-1822). An Italian chemist, naturalist, and engineer, born in Florence. As the friend and collaborator of Fontana he became director of the physical cabinet of the Grand Duke of Tuscany. He was appointed by Napoleon director of the roads and bridges leading beyond the Alps. The construction of the pass across Mount Genève, and the Corniche, the celebrated road leading from Nice to Geneva, was carried out by him. He worked in almost every field of science, so that Cuvier dubbed him a "living encyclopædia." He wrote many useful treatises on botany, chemistry, and rural economy, such as *Antichità, vantaggi e metodo della pittura encausta* (1797); *Degli antichi abitatori d'Italia* (1803); *Ricerche sulla Quina* (1803); *Dei provvedimenti annonarij* (1808).

FABRY, fū'brè, WILHELM. See **FABRICIUS, HILDANUS**.

FABULOUS ANIMALS. See **BESTIARIES; GRIFFIN; UNICORN; FABLE; HERALDRY; BASILISK**.

FABVIER, fā'vyā', CHARLES NICOLAS, BARON (1782-1855). A French general and philhellene. He was born at Pont-à-Mousson and in 1807 was sent by Napoleon to Constantinople to fortify that city against an attack by the English fleet. He later organized a park of artillery at Ispahan, Persia, for defense against Russia. He was the adjutant of General Marmont in Spain in 1811, and in 1813 was advanced to the rank of colonel on the general staff. In consequence of his political activity against the restored monarchy he went to England, and in 1823 to Greece to participate in the War of Greek Independence. He was appointed commander in chief of infantry, but failed to retain the confidence of the Greeks, because of the unfortunate expedition to the island of Chios and the loss of the Acropolis; and in 1829 he returned to Paris, where he became chief of staff to the National Guard. In 1848 he was Ambassador to Constantinople. His publications include *Journal des opérations du VI corps pendant la campagne de 1814 en France* (1819). Consult Debidour, *Le général Fabvier, sa vie et ses écrits* (Paris, 1892), and the same author's "Fabvier à l'Acropole" and "Les dernières années du Général Fabvier," in *Séances et travaux de l'Académie des sciences morales et politiques*, vols. 159, 161 (Paris, 1903, 1904).

FABYAN, or FABIAN, ROBERT (?-1513). An English chronicler, who was a member of the Drapers' Company and an alderman of London. His *New Chronicles of England and France*, first published in 1516, begin with the arrival of Brutus and extend to the battle of Bosworth (1485). His efforts to harmonize the accounts of previous writers were rendered almost valueless by his lack of judgment and his inability to sift evidence, but he is a valuable authority for the affairs of London during his own time. The chronicle was continued by others in successive editions until 1558, and in 1811 an edition was issued by Sir Henry Ellis. In Stow's *Survey of London* there seems to have been used material gathered by Fabyan but not found in his *Chronicles*.

FAÇADE, fâ-sâd' or fâ-sâd' (Fr., front of a building). The exterior front or face of a building. The rear of an important building is sometimes called the rear façade, and an edifice may have as many façades as it has architectural faces with individual treatment. Thus a Gothic cruciform church commonly has three façades—viz., the west or main front, and the ends of each transept; in a Greek temple the two short gable ends are façades, while the two long sides are merely flanks. An elevation of the side of a building is called the *lateral* façade. The sides of a court or cortile are often called façades, but this is an incorrect application of the term. A façade which does not conform to the section of the building behind it, but rises above or extends beyond it, is called a *screen* façade, as in the case of many Italian churches (Pisa Cathedral, the Certosa at Pavia, etc.), of some English cathedrals, as Peterborough and Lincoln, and of many Romanesque churches of France. Such a method was apparently unknown in ancient and early Christian architecture.

FACATATIVÁ, fâ'ká-tâ'tá-vâ'. A town in the Department of Cundinamarca, Colombia, about 20 miles northwest of Bogotá. It lies about 8500 feet above sea level, and was a fortress of the Chibcha Indians, whose last chief, Triquesupa, was killed here by a soldier under Quesada in 1538. The town derives some commercial importance from its proximity to the capital. Pop., about 8000.

FACCIOLATI, fâ'chô-lâ'tâ, JACOPO (1682-1769). An Italian classical scholar and lexicographer. He was born at Torreglia, not far from Padua, and was educated at Padua, where he became professor of logic and later rector of the Institution. He was famous throughout Europe as a teacher. He directed his attention chiefly to the revival of the study of ancient literature, and with this object brought out a new edition of the *Lexicon Septem Linguarum*, called, from its original author, the monk Ambrosius of Calepio, the *Calepine Lexicon* (see CALEPINO). He was assisted in this work by his pupil, Egidio Forcellini (1715-19). To Facciolati has often been credited the conception of a great work, *Totius Latinitatis Lexicon*; it has commonly been said that Forcellini aided him in this work. But C. E. Bennett in "The Authorship of the Forcellini Lexicon," in *The Classical Weekly*, v, 34-37 (New York, 1911), has clearly shown that Forcellini not only conceived and planned this work, but executed it in full himself; for forty years (1718-58) he labored on the *Lexicon*, which was finally published in four volumes (Padua, 1771). The *Lexicon* in its time was of immense value; original documents printed in the last revision, by De Vit (Prato, 1858-87), prove clearly Forcellini's authorship. It has been said that, were Latin literature to perish, it could be restored from Forcellini's *Lexicon*. Facciolati published *Fasti Gymnasti Patavini*, a history of the University of Padua (1757). Facciolati and Forcellini, assisted by several others, likewise published a new edition of Nizoli's *Thesaurus Ciceronianus*. See FORCELLINI.

FACETIE, fâ-sê'shi-s (Lat., witticisms). A collection of witty sayings and short tales in prose or in verse. A Greek collection of this kind called *Asteia* (ed. by Eberhard, Berlin, 1869) was attributed to Hierocles (q.v.). Facetiae were common in the late mediæval Latin

writers, but the first book devoted wholly to them seems to have been the *Liber Facietiarum* of Poggio Bracciolini (Rome, 1470). For the jest in modern literature, see JEST.

FÂCHEUX, fâ'shê', LES (Fr., The Bores). A comedy by Molière (1661).

FA'CIAL ANGLE. See ANTHROPOMETRY.

FACIAL NERVES. The seventh cranial nerve in Sommering's classification is the motor nerve of the face. It originates in the floor of the fourth ventricle of the medulla oblongata. Leaving the interior of the skull by a diverse course through the temporal bone, entering the petrous portion of the latter through the internal auditory meatus, it reaches the tympanum, crosses its internal wall, takes a downward course through the Fallopiian canal, and finds its exit through the stylomastoid foramen. It supplies the buccinator and all the muscles of expression of the face, the muscles of the external ear, the platysma, stylohyoid, and part of the digastric muscle in the neck. According to an earlier classification the seventh and eighth nerves were considered as one, because in part of their course they occupy a common sheath. From their consistency the facial was called the *portio dura*, and the eighth, or auditory, the *portio mollis*. The sensory nerve of the face is the trigeminal, or trifacial nerve, known as the fifth in Sommering's list. It has three branches: (1) the ophthalmic, which passes to the eyeball, the brow, the forehead, and the nose; (2) the superior maxillary, which supplies the side of the nose, the lower eyelid, and upper lip; (3) the inferior maxillary, which supplies principally the teeth and gums of the lower jaw and the lower lip. For the deep origin and exact description of these nerves, consult Gray, *Anatomy* (Philadelphia, 1913).

FACIAL NEURALGIA. A paroxysmal pain in the head and face, in the parts to which the trifacial or trigeminal nerve runs. (See FACIAL NERVES.) There are two varieties: 1. *Symptomatic facial neuralgia*, with pains sharp and intense, often lasting for many days without ceasing, or disappearing and returning frequently. It is caused by anæmia, exposure, bad teeth, gout, rheumatism, diabetes, syphilis, malaria, hysteria, epilepsy, injury, or septic poison. Application of heat or of menthol may relieve, or quinine, arsenic, or aconitia (a dangerous drug), with treatment of the cause. 2. *Tic douloureux*, a very intense form, in which the pains last a few moments each time, recurring on moving the tongue or chewing, exposure to a draft, etc., and dependent upon a neuritis or degenerative process in the nerve. Salicylates, injections of alcohol, or electrical diffusion of cocaine or iodides may relieve. Removal of a part of the nerve or of a ganglion connected with the nerve may be required. The ganglion itself has been injected by means of a long hollow needle—an exceedingly delicate operation, not unattended with danger.

FACIAL PARALYSIS. Paralysis of the facial nerve on which depends the power to move the muscles of the face. One or both sides of the face may be thus affected. The paralysis may be central, due to disease of the brain, or peripheral, due to disease of the nucleus from which the nerve springs, or of the nerve itself. The latter is the frequent type and is called "Bell's palsy." In this form there is paralysis of one side of the face, which comes on rapidly,

the face being drawn to the unaffected side, while the eye of the affected side remains open, the tears overflow, the tongue deviates to the affected side, and saliva drips from the angle of the mouth. The patient cannot whistle. Food collects between the cheek and the gums on the affected side. Taste is lost in many cases on the anterior part of the tongue on the affected side. Electrical contraction of the affected muscles is abnormal and in time reveals degeneration of the nerve tissue. Facial palsy is caused by gout, exposure, syphilis, or middle ear disease, etc. The treatment usually consists in the administration of iron and strychnine, and the application of galvanism over the "motor points" of the individual muscles thus affected. A hook of protected wire worn over the ear and holding up the angle of the mouth may be of use in some cases. The cause must also be treated. Recovery is the rule, except in cases where the nerve has been divided by operation or disease. Anastomoses of the peripheral end of the cut nerve with the spinal accessory or the hypoglossal nerves is sometimes undertaken, with a fair degree of success. See PARALYSIS.

FACINGS, MILITARY. The colored trimmings of military uniforms, which denote the branch of the service to which the wearer belongs. The facings on the edge of a coat are called *pipings*, those on the skirt of the coat, *back slashes*. Formerly the term *facings* applied only to the colored cuffs and collars. In the United States the facings of infantry are white and blue; of cavalry, yellow; and of artillery, scarlet. The uniform regulations of 1902 substituted for the colored cuffs and collars dark blue piped with the appropriate color, except in the Quartermaster Corps, which retained the buff collar and cuff. The other facings are as follows: Engineers, scarlet piped with white; Hospital Corps, maroon piped with white; Ordnance, black piped with scarlet; Service Schools, green; Signal Corps, orange piped with white.

Up to the end of the last century in the British army the royal regiments used blue facings; the nonroyal white for English, yellow for Scottish, and green for Irish regiments. This custom has been changed and at the present time regiments are authorized to use the distinctive regimental colors and facings belonging to the individual regiment previous to 1881.

In modern armies bright-colored facings are used only on the *dress uniform*, worn in garrison and on ceremonial occasions. The *field uniform*, for protective reasons, is of a neutral, nondescript color: olive drab in the United States army, khaki in the British army. Similar neutral colors are used for the field uniform of other Powers.

FACINO CANE, fā-chē'nō kē'nā. A tale by Balzac, setting forth the story of the author's struggles (1836).

FACSIMILE, fāk-sim'ī-lē (abbreviation of Lat. *factum simile*, made like). An exact copy, especially of handwriting, of printed works, engravings, inscriptions, manuscripts, and the like.

FACTOR (Lat., a maker, from *facere*, to make). In arithmetic any one of the integral numbers whose product is a given number is called a factor of that number; e.g., in $72 = 4 \cdot 9 \cdot 2$, 4, 9, 2 are the factors of 72. A number factor is a factor which is a prime number. Thus the prime factors of 72 are 2, 2, 2, 3, 3. In algebra the factors of a rational integral alge-

braic expression are the rational integral expressions which, multiplied together, produce it; e.g., in $x^2 - y^2$, the factors are $(x - y)$, $(x + y)$, $(x^2 + xy + y^2)$, $(x^2 - xy + y^2)$. These factors can be factored further, but not into rational factors. Thus the expression is said to be fully factored in the domain of rationality. The highest common factor in algebra is the factor of highest degree common to the given expressions, and although it corresponds to the greatest common divisor in arithmetic, it must not be confounded with it. If numbers are substituted for letters, the value of the highest common factor is not always the greatest common divisor of the values of the given expressions; e.g., the highest common factor of $x^2 - 3x + 2$ and $x^2 - x - 2$ is $x - 2$. Let $x = 31$; then the values of the expressions are 870, 923, whose greatest common divisor is 58; but $x - 2$ is only 29. See also DIVISION.

FACTOR. An agent employed to sell the goods of another; in the United States such an agent is usually called a commission merchant, because he has his compensation in a commission or percentage upon the goods he sells. He differs from a broker in that he has actual possession of the goods of his principal and is empowered to deliver them to the purchaser as if they were his own. He often buys and sells in his own name, so that those dealing with him may not know whether he is owner or factor. Under some limitations for self-protection he is bound by the instructions of his principal and responsible for damages arising from a violation thereof. As a rule he must obey special instructions, and if none are given, he is bound to use all reasonable care in the management of the property committed to his charge, to employ the usual methods of business, and to have due regard to the interests and welfare of his employer. Otherwise he is not entitled to his commissions, and for injurious neglect of duty may even be sued by his principal. He cannot delegate his authority without express permission of his principal unless such delegation is justified by general usage or by stress of peculiar circumstances. He cannot sell goods at a sacrifice for the purpose of obtaining his commission and advances. It is generally held that a factor who has made advances upon goods acquires such an interest in them that the principal cannot take them out of his possession by a revocation of his authority. The factor can sell enough of them to reimburse himself if the principal unreasonably neglects or refuses to pay him. Sometimes, in consideration of an increased commission, he guarantees to the principal payment for the goods which have been sold. In that case he acts under a *del credere*, or guaranty, commission, and is in general subject to most of the obligations of a surety. It was formerly held that a factor whose principal resides in a foreign country is personally liable to the other party, even though the foreign principal was disclosed. The modern view is, however, that a factor who names his principal is not personally liable on contracts made for his principal, whether foreign or domestic, provided they are within the factor's authority and do not profess to bind him personally. See AGENT. Consult: Mechem, *Treatise on the Law of Agency* (Chicago, 1889); Evans, *Treatise on the Law of Principal and Agent* (New York, 1891); Bowstead, *Digest of the Law of Agency* (5th ed., Toronto, 1912).

FACTOR ACTS. The legal designation of a series of modern statutes in England and America, conferring upon agents who are intrusted with the possession of goods the authority to vest a good title thereto in an innocent purchaser. At common law a factor (q.v.) had no implied authority to pledge or barter his principal's goods. Even when they were shipped to him, and their possession as well as the bill of lading or other document of title intrusted to him, he had not the legal power to pledge or barter them. The common-law doctrine, that a person cannot give a better title than he possesses, enabled the principal to recover his property from a pledgee, although the latter had advanced money to the factor in the honest belief that he was the true owner. The inconveniences resulting from this principle, with the opportunities for fraud which it permitted, led the mercantile and banking community to demand that a person into whose possession goods or documents of title were put by the true owner be treated as having unqualified power to dispose of them. Partial effect was given to this view in England by the Factors Act of 1825 (Geo. IV, c. 94), and in a few of our States by legislation fashioned after that statute. Under these acts, factors or agents of a similar character, who are intrusted with the possession of goods or the documents of title thereto for the purpose of sale, are to be deemed the true owners, so far as to give validity to any sale or pledge made by them to an innocent purchaser or pledgee for value. In England the new doctrine has been carried even further than this. The courts there, as here, having construed the earlier acts very strictly, the mercantile community has insisted upon their repeated revision; each new statute going further than its predecessor towards the substitution for the common-law rule, stated above, of the doctrine which prevails upon the continent of Europe, that any one in the possession of goods, with the consent of the owner, whether a factor or not, shall be able to give a perfect title thereto to an innocent purchaser for value from him. This legislation, taken with that upon conditional sales, has practically abrogated, so far as personal property is concerned, the former doctrine of the common law that the purchaser of property buys it at his peril and gets only such title as his vendor has to give. See *CAVEAT EMPTOR*. Consult: Chambers, *Sale of Goods Act* (London, 1890); Pearson-Gee, *Commentary on the Sale of Goods Act* (ib., 1893); Burdick, *The Law of Sales of Personal Property* (3d ed., Boston, 1901); Benjamin, *Treatise on the Law of the Sale of Personal Property* (5th ed., London, 1906).

FACTOR OF SAFETY. The excess of strength or capacity to resist stress due to forces applied to the structure, expressed as a multiplier of the greatest anticipated normal stress. That is, if a structure is six times as strong as it need be to withstand the greatest expected or computed stress, the factor of safety is six. It allows for some defects in the material, some uncertainties in the assembly of structural elements, some exceptional increase in loads or stresses above the normal or usual, some excessive stresses in the processes of assembly, some ignorance, and differences of opinion as to magnitudes of stresses and the resisting strength of the materials. It is always more than two, but rarely larger than ten. See **STRENGTH OF MATERIALS**.

FACTORIES AND THE FACTORY SYSTEM. A factory may be defined as an establishment where a number of persons cooperate by consecutive processes in the production of some article of consumption. (Carroll D. Wright, in his report on the factory system for the Tenth United States Census, uses the following definition, which he borrows from Taylor's *Factories and the Factory System*, published in London in 1844: "A factory is an establishment where several workmen are collected for the purpose of obtaining greater and cheaper conveniences for labor than they could procure individually at their own homes; for producing results by their combined efforts which they could not accomplish separately; and for preventing the loss occasioned by carrying articles from place to place during the several processes necessary to complete their manufacture.")

Historical Development. As is the case with most other great industrial movements, it would be difficult to assign to the origin of the factory system an exact place or date. The system originated in England in textile manufacture, during the latter half of the eighteenth century, but its germ already existed in the carding and fulling mills which had been common for many years previous. During the eighteenth century, however, a remarkable series of inventions was made, by which automatic machinery was introduced as a substitute for, or at least a supplement to, hand labor in the manufacture of cotton and woolen cloth. The history of these inventions, among the most important of which are those of Arkwright, Hargraves, Cartwright, and Crompton, is given elsewhere in the biographical sketches of their inventors and in the general articles on **SPINNING** and **WEAVING**. The importance of these inventions, not only industrially, but economically, can scarcely be overestimated, for by them not only was the cost of clothing wonderfully cheapened and physical comfort thereby increased, but a new system of industrial activity was developed which was destined to supplant the old system of master and apprentice, not only in the textile manufactures but in nearly all branches of labor, from the making of a watch to the slaughter of live stock. This change was a necessary accompaniment to the use of the new inventions, for machinery of itself is too expensive and its use involves too large an outlay for raw material and for disposing of the finished product to make it available to the independent artisan.

The introduction of automatic textile machinery was accompanied by the opposition, and by the persecution of its promoters, which have characterized most of the great movements for the world's betterment. At first, too, the new system met with failure from another source, the lack of sufficient capital and of a sufficiently large group of laborers to render profitable or even possible the installation of the more expensive power-driven machinery. Only water power was available to drive the machinery; hence the operator must locate his factory, not at some important industrial centre, but at a spot where sufficient supply of water power was available, and this might be an isolated place where labor was scarce. It is interesting to note that some of England's earliest factory legislation, as the Robert Peel Act of 1802, was directed towards correcting the abuses in the employment of pauper and more especially child

labor by these early operators, who could not procure in the neighborhood of their factories sufficient adult labor to run their machines. If, then, the first step in the introduction of the factory system was the invention of automatic machinery—in distinction from tools—the second step was the application of steam as a motive force to drive this machinery. The use of steam at once freed the operator from geographical restrictions and made it possible for him to locate his factory where both labor and the demand for its fruits were most abundant.

But with the slow, cumbersome, and expensive methods of transportation that were in vogue until the close of the eighteenth century the factory system could not have attained its present proportions. The output must have been regulated largely by the local demand. Hence the third step in the development of the modern factory system was made possible by the introduction of the steamship and the railway, by means of which the products of any locality could be sent quickly and cheaply to all parts of the world. But previous to the appearance of steam navigation, from 1767 on, the canal system was widely extended throughout England, and, by enabling the cheap distribution of coal and iron, proved of great importance to manufacturing in large factories.

A fourth factor in the development of the factory system was the evolution of the patent system. Automatic machinery presupposes the work of men of inventive genius, upon whose labors it is absolutely dependent. When the fate of such men was almost certain persecution and poverty, an inventor must be a hero as well as a genius, and under such conditions inventions were few and far between. As Byrne points out in his *Progress of Invention in the Nineteenth Century*, until the close of the eighteenth century superstition had so strong a hold upon the human mind that inventions were almost synonymous with the black arts. A labor-saving machine was looked upon as the enemy of the working man, and many an earnest inventor, after years of arduous thought and painstaking labor, saw his cherished model broken up and his hopes forever blasted by the animosity of his fellowmen. But during the nineteenth century the patent system, which had long been in existence, was so fostered and developed by government that it became possible for a man not only to benefit his fellows, but to earn a comfortable and honorable livelihood by the exercise of his inventive faculties. Under this stimulating influence appeared a series of important inventions which resulted in the extension of automatic machinery, and hence of the factory system, which was at first limited to textiles, to all branches of industry. Chief among the multitude of important inventions which stimulated the development of the factory system were the planing machine (1802), the circular wood saw (introduced into the United States in 1814), galvanized iron (1837), vulcanizing of rubber (1839), Howe's sewing machine (1846), watch making by machinery (1850), Bessemer process of making steel (1855), paper from wood pulp (1864), McKay shoe-sewing machine (1861), the Siemens-Martin open-hearth steel process (1866), and the roller mill and middlings purifier for making flour (1875).

Although the four steps essential to the growth of the factory system—the introduction of auto-

matic machinery, the application of steam as a motive force, improved methods of transportation, and an enlightened encouragement of the patent system—had all been taken at the beginning of the nineteenth century, the growth of factories was slow, even in England and the United States, where it was least opposed. At first England, in which the great textile machines were brought out, jealously guarded her treasures and passed severe laws prohibiting the exportation of machinery or models thereof. In spite of several attempts on the part of Americans to introduce English methods, the secrets were tolerably well kept until 1790. In that year a factory was built by Samuel Slater at Pawtucket, R. I., in which Arkwright's system of water-frame spinning was introduced. From that time the factory system, as applied to textiles, promoted by Whitney's invention of the cotton gin in 1792 and by Lowell's introduction of the power loom and other improvements in his factory at Waltham, has enjoyed uninterrupted progress and has powerfully influenced the development of the factory system in other lines. Carroll D. Wright says that the Lowell factory at Waltham, Mass., completed in the fall of 1814, "was the first in the world, as far as the records show, in which all the processes of converting raw cotton into the finished product were performed in one establishment, by successive steps under one harmonious system."

Owing to different economic conditions—due to the difference between an old country, where population centres are fixed, and a new, where immigration and the rapid growth of the country make any favorable site a possible centre of population—the development of the factory system in the United States was not only later, but also different in character from that in the mother country. Water power continued to be the almost exclusive motive power long after the application of steam was understood. It was the splendid water power offered by the Merrimac River that determined the location of Manchester, Lowell, and Lawrence, and so powerfully affected the industrial growth of New England. It may be added that the inventions and achievements of the hydraulic engineer have been scarcely less essential to the development of America's factory system than those of the inventor of automatic machinery. Many of the experiments in hydraulic engineering which have been most fruitful were conducted in efforts to improve current methods of developing and applying water power as a motive force for driving machinery. Within recent years the possibilities of utilizing water, especially at a long distance, have been enormously increased by transmitting power in the form of an electric current.

Outside of the cotton and woolen mills the growth of the factory system in the United States was slow. Domestic and neighborhood industry continued to predominate, even in these industries, until 1830, and it was not until 1840 that the factory method extended itself widely to miscellaneous industries. It was in 1840 that Bigelow applied power-driven machinery to the weaving of carpets, and 10 years later, at Waltham, Mass., automatic machinery was used for the first time, by consecutive processes, in a single manufactory, in the making of the most delicate of mechanical instruments, the watch. (See WATCH.) Gradually, with the invention

of the requisite machinery, the new method of production was extended to other industries. During the last half of the century, and particularly after the close of the Civil War, factories of all kinds sprang up, first in New England and later in the West and South. The new system obtained little footing in the South until the very close of the century, when, tempted by the low cost of "mountain white" and colored labor, much capital, largely from New England, was directed towards the establishment of factories in the South. By the close of the century the system prevailed throughout America and the greater part of Europe as the usual means of production, to the almost entire extinction of domestic and small-shop industries. Germany, in particular, experienced a great industrial awakening towards the close of the century, and has so far outstripped England in the extent and variety of her factory products that the phrase "made in Germany" is the bugbear of the English manufacturer. The nineteenth century also saw the establishment of the factory system in India, Japan, and China. In China the attempt has scarcely passed the experimental stage; for, though wages are low, labor is so unskilled and unreliable that, measured by the product, it is most expensive.

The great advances made in all departments of applied science during the century have already proved far-reaching in their effects upon the factory system. The use of electricity for long-distance transmission of power has already been mentioned. For distributing and applying power as well, electricity is proving an economical and convenient substitute for steam, and seems likely to do away with much of the cumbersome and uncleanly shafting and belting by means of which power is distributed through the ordinary factory. Edward Atkinson goes so far as to prophesy that the use of electric power, so easily transmitted and applied, will finally result in the dispersion to their own homes of the multitudes of workers now gathered in factories, and that the weaver will work at his own loom and the spinner at his spindle in his own cottage, and a new form of power-driven household industry will supplant the factory system. Few will agree with Mr. Atkinson in thus forecasting the probable effect of electricity upon the factory system. The whole trend of modern industry is towards a still greater centralization of capital and labor. "The larger the plant the cheaper the product," says a prominent mill operator. Andrew Carnegie, writing on the development of the steel industry in the United States, puts the case still more forcibly when he says: "One essential for cheap production is magnitude; concerns making 1000 tons of steel per day have little chance against those making 10,000 tons. We see this law in all departments of industry. It evolves the 20,000-ton steamship and the 50-ton railway car. Improved engines and the use of electricity as a motor, the new loading and unloading machinery are all contributory causes to the cheapening of steel. . . . Among those contributory causes," adds Mr. Carnegie, "automatic machinery ranks first and continuous processes next. Workshops 1100 and 1200 feet long are becoming common, in which the raw material (ore) enters at one end and emerges finished (steel billets) at the other without handling, and often without stopping except for reheating."

In one branch of industry, however, two other

systems of production have flourished side by side with the factory system, although apparently antagonistic to it. These are the sweat shop and tenement-house work in connection with the ready-made clothing industry. (See SWEATING SYSTEM.) In all branches of the clothing industry—not only in the making of textile garments, but of hats, gloves, and shoes—home and small-shop labor have been strangely persistent. Certainly the abuses which have sprung up in connection with the manufacture of clothing outside of factories have been so grave and far-reaching as to make the evils of the factory system seem but trifling in comparison. In fact, the obvious and universally proposed remedy for the sweat shop and for unsanitary tenement-house labor is the application of the full-fledged factory system to the manufacture of all parts and all kinds of garments.

Having traced the fundamental causes which have produced the factory system, one is led to ask, What are the effects of this system industrially, economically, and sociologically upon modern life? The introduction of the factory, with its great economy of labor, has often created crises of unemployment. Its competition has destroyed hand industries, rendering obsolete much painfully acquired skill and reducing prosperous mechanics to indigence. Its ultimate effect, however, has rather been to increase the demand for labor than to reduce it. A more accurate timekeeper can now be produced in a watch factory for a few dollars and in a few hours than the skill of the Swiss watchmaker, whose family has been trained for generations to the work, can produce in as many weeks. But this cheapening and bettering of the product has so enormously increased the demand that a proportionately larger body of men are engaged in different branches of the business—from the inventing and making of the delicate machinery required to the selling of the finished product—than ever before. Although this may not be true in all branches of manufacture, yet the introduction of the factory system, by cheapening production, has so raised the standard of living and enlarged the number of industries that labor was never so much in demand nor so well paid as at present.

But while most authorities admit the great industrial advantage of the factory system, the nature of its economic and sociological tendencies, and especially of its intellectual and moral effects upon the factory employee, are disputed. Low wages, unsanitary working conditions, exploitation of the labor of women and children antedate the factory system, just as they are found to-day in parts of Europe untouched by its influence. It would appear, however, that under no other system can the worker be so mercilessly driven, so completely sapped of his natural energies, as under the factory system. On the other hand, the conditions of labor are much more easily regulated by law than in the small workshop. Further, the aggregation of workers under one roof leads naturally to organizations and to collective resistance to conditions that are intolerable. The factory system, with its natural consequences, trade unionism and labor legislation, may properly be regarded as a potent means for elevating the worker from the hopeless poverty in which he was sunk in early modern times. But it is to be borne in mind that the development of labor

organization and of the legal regulation of labor is slow, and that hence the first effect of the introduction of the factory system is to increase the hardships to which the laboring class is subject. Even in a country with a long-established factory industry, like England, there are evidences of widespread physical, mental, and moral degeneracy of the working population, traceable to child labor, insecurity of employment and overstrain. Students of labor conditions in America have frequently called attention to the injuries suffered by female workers through the strain of tending speeding machinery and to the early superannuation of male factory workers, essentially a result of overwork. While there has been a progressive shortening of the working day (see EIGHT-HOUR DAY), few would maintain that this has been sufficient to counteract the effects of increasing speed. Much hope is at present reposed in the developing systems of scientific management (q.v.), which has for one of its cardinal principles the relief of labor from excessive strain.

It is also contended that the factory system, in which each operator repeats indefinitely a single task, requires and creates a lower grade of intelligence among workmen than the old system under which the laborer knew the whole of his trade; that the man who works in the modern shoe factory, feeding an automatic sole-cutting machine or automatic heeler, does not need and will not have the mental vision of the ancient shoemaker. It is unquestionably true that many operations that formerly required the services of a highly skilled mechanic have been subdivided in the factories into minute parts, each of which is performed by an operative in mechanical routine measurable in speed alone. It must not, however, be forgotten that the factory makes employment for a large body of foremen, overseers, mechanical experts, etc., elevated from the ranks of common labor and enjoying a lot far superior to that of the master workman of an earlier period. Even the common laborers of the factory, when not crushed with overwork, find in the opportunities for social life and organized activity rendered possible by a shorter working day, some offset for the loss of interest entailed by the automatic character of their employment.

It cannot be denied that the factory system, by the specialization of industries in given localities, thus making each community dependent upon all the rest of the world for everything except the one or few articles locally produced, has enormously quickened commerce and increased the interdependence of nations and is thus one of the greatest unifying forces of the age. See LABOR; LABOR LEGISLATION; MANUFACTURES.

FACTORY ACTS. See LABOR LEGISLATION.

FACTORY INSPECTION. The most important part of factory legislation, for it is only by the constant visits of well-trained, intelligent, and efficient inspectors that factories can be prevented from evading and practically nullifying the laws. Such inspectors can strengthen the laws by liberal interpretations of their powers, by advocating better legislation, and by publishing full reports in which the facts are presented in such a way as to impress the general public with the need of reform. Unfortunately few factory inspectors are as yet trained workers. As a rule, their numbers are insufficient to maintain adequate supervision of all factories; many are political appointees; some are conscientious but unintelligent. It is, however, due to the labor of certain inspectors that many improvements have been made in the laws. The first factory act was passed in England in 1802, which was to be enforced by the local justices, who should appoint visitors. In 1833-34 four government inspectors were appointed, to whom nine inspectors were added in 1842, and sub-inspectors, together with greater powers, in 1844-46. A law of 1867 experimented with the inspection of workshops by means of local authorities, but the centralized system was found superior. The consolidated Act of 1878 increased the staff of inspectors, and since 1893 working men and women have been appointed on the force, and the numbers again increased. The department is under the Home Office, the chief inspector in London, fire superintending inspectors in London, Manchester, Glasgow, and Leeds, and 48 assistants. The inspectors render admirable reports, the working men frequently go to them for advice, and the trade-unions demand that their number should be increased. In the United States factory inspection is provided for by law in a majority of States, yet as late as 1913 there were 14 States, with more than half a million industrial wage earners, with no provision for factory inspection whatever. Of the remaining States very few have thoroughly efficient systems. The most frequent defects are: (1) inadequate number of inspectors, Texas, e.g., having in 1913 only one inspector; (2) failure to enforce standards of efficiency in the selection of inspectors; (3) lack of centralized control of inspection. The inspection of factories is in most States under the department of labor; in some States it is an independent department. In Massachusetts factory inspection is conducted by the police department. In Wisconsin so much of factory inspection as pertains to safety and sanitation is under the control of the Industrial Commission. In 1886 the International Association of Factory Inspectors, with members from Canada and the United States, was organized to promote uniformity in factory laws. See LABOR LEGISLATION; LABOR PROBLEM; SWEATING SYSTEM.

FACULÆ (plur. of Lat. *facula*, small torch). In astronomy, the spots, brighter than the rest of the surface, which are sometimes seen on the sun's disk. They are usually very small at first, but finally assume very large dimensions. See SUN.

FACULTATIVE PLANT. A plant able to grow in more than one life condition; applied especially to plants that may be either parasites or saprophytes, as opposed to obligate plants. See SYMBIOSIS; PARASITE; PLANT.

FACULTY (Lat. *facultas*, ability, from *facilis*, easy, from *facere*, to do). A term used generally in psychology to denote any sort of mental function. Specifically the name "faculty psychology" is applied to a psychological school which has its typical representative in Christian Wolff and its most renowned expositor in Immanuel Kant (q.v.). Its mode of procedure is to take the functional terms in common use (feeling, perception, understanding, memory, imagination, etc.), and by logical process to reduce them to some one, two, or three principal faculties, to which the others are then subsumed as subordinate faculties. The mind thus appears as constituted of certain powers or potentialities, which are realized in the individual cases of remembering, thinking, etc. Wolff himself recognizes two principal faculties—knowledge and desire—though he endeavors to unify them in a single supreme faculty of representation. The lower faculty of knowledge includes sense, imagination, the poetic faculty, and memory; the higher includes attention, reflection, and understanding. The lower faculty of desire, again, comprises pleasantness and unpleasantness, sense desires and aversions, and emotion; the higher includes volition, positive and negative, and freedom. Kant adopts a threefold classification of mental phenomena, though he subordinates all the mental powers to the faculty of knowledge ("understanding," in the wider sense). This comprises (1) understanding in the narrower sense, which is legislative for knowing; (2) reason, which is legislative for the faculty of desire; and (3) judgment, which legislates for feeling. Knowledge is further divided into a lower or receptive faculty of sense, and a higher or active faculty of understanding.

It is clear that a psychology based on these principles of classification can never pass the bounds of superficial description. It makes no effort to analyze mental processes; and the powers or functions which it discriminates have no biological or genetic sanction. Moreover, there is always the danger that a classificatory term, such as "memory," shall be raised to the rank of an explanatory principle, substantialized or hypostatized; in which case superficiality is changed to serious error. It does no harm to group together all the facts of remembering and forgetting, under a general class term "memory"; such grouping may, indeed, be useful, as serving to bring all the relevant facts before the psychologist's attention. But if we go further and proceed to account for a given fact of remembering by appeal to the mind's power of memory we have involved ourselves in a vicious circle. It is one of Herbart's great merits that, (1) by insisting on the need of starting psychological investigation from the given facts and not from possibilities which the facts are supposed to realize, and (2) by emphasizing the abstract and purely classificatory nature of the faculty concepts, he removed a powerful and growing abuse and paved the way for the more vigorous and scientific methods of modern psychology. The service is all the greater, since "popular" psychology is, in the nature of things, a faculty psychology, and the doctrines of the

latter are therefore peculiarly insidious. Consult: Herbart, *Werke*, ed. by Von Kehrbach (Leipzig, 1882); Wundt, *Physiologische Psychologie* (ib., 1908-11); Titchener, *Experimental Psychology*, I, ii (New York, 1901).

FACULTY, OF A UNIVERSITY. See UNIVERSITY.

FACULTY OF ADVOCATES. See ADVOCATES, FACULTY OF.

FADETTE, fà'dèt', LA PETITE (Fr., the little Fadette). An idyllic romance by George Sand (1848).

FADEYEV, fà-dà'yéf, RASTISLAV ANDREÉVITCH (1824-84). A Russian soldier and military author. He was born at Pkaterinoslav and educated at the artillery school in St. Petersburg. At the age of 16 he entered the army that served in the Caucasus. He subsequently participated in the war in Asiatic Turkey, was present at the siege of Sebastopol, and in 1864 was promoted to the rank of major general. In consequence of a Panславistic publication, entitled *The Military Power of Russia* (1868; Ger. trans. by Eckardt, 1870), which caused considerable stir at the time, and in which he demanded the annihilation of Austria and expressed sentiments strongly antagonistic to Germany and favorable to France, he was compelled to resign his commission in 1866. He was subsequently sent on missions to Egypt (1875) and Servia and Montenegro (1877), where he participated in the siege of Antivari. In 1881 General Ignatev gave him an appointment in the administrative department of the press at St. Petersburg. His publications in the Russian language, which are widely known, comprise besides the works already mentioned: *Sixty Years of War in the Caucasus* (1860); *Opinion on the Eastern Question* (Eng. trans. by T. Mitchell, 1871; also trans. into German); *Letters on the Present State of Russia* (1881). His collected works were published at St. Petersburg in 1890 (4 vols., including a biography and a review of his literary activity).

FÆCES, fæ'séz (Lat. *fæx*, dregs). Excrements, the waste material evacuated from the bowels, consisting of undigested food, indigestible parts of food, bile, mucus, and certain other matters taken from the blood by the liver and other glands. In birds, reptiles, and fishes, in the Monotremata order of mammals, and in many lower animals, urine is also mixed with the fæces before they leave the body. The fæces of the horse, cow, and hen are commonly spoken of as manure and used as a fertilizer. The excrement of wild birds, collected in great quantities on islands where they propagate, is called guano (q.v.). Human excrement, after being prepared by a patented process, is called pou-drette, which is also used as a fertilizer. The composition of human fæces is shown in the following table:

	Per cent.
Water	73.3
Organic remains	7.0
Biliary and nitrogenous matter	14.9
Albumen	0.9
Extractives	2.7
Salts	1.2

The examination of the fæces has become an important diagnostic measure. Macroscopically, abnormal quantities of mucus, deficiency of bile, excess of fat, gallstones, casein curds, soaps, and intestinal worms may be discovered. *Intestinal sand*, consisting chiefly of particles of phos-

phate or carbonate of calcium, magnesium, or iron, occurs in the stools of certain neurotic individuals. *Acotorrhœa* is an excess of muscle fibres and indicates pancreatic disease.

Microscopical examination reveals the presence of minute parasites, the amoeba (in amoebic dysentery and liver abscess), bacteria, starch granules, blood corpuscles, etc. Bacteria are very numerous; their weight equals about one-third of the weight of the dried stool.

FAED, fad, JOHN (1819-1902). A Scottish miniature, genre, and historical painter. He was born at Barlay Mill, in the Stewardry of Kirkcudbright, where his father was an engineer and millwright. His talent was precocious, and at 12 he traveled through the villages of Galloway, painting miniatures of the gentry and middle classes. In 1839 he attended the art classes at Edinburgh, and practiced successfully for more than 40 years as a miniature painter; but gradually he turned to biblical and literary subjects. He was elected to the Royal Scottish Academy in 1851. In 1862-80 he resided at London, retiring finally to Gatehouse, near his birthplace, where his last years were spent. His work is essentially literary in character, detailed and elaborate in finish, but lacking in pictorial charm. His younger brother JAMES, an engraver of note, often engraved his brother's pictures. Among his chief works are: "The Cruel Sisters" (1851); "Shakespeare and his Friends at the Mermaid Tavern"; "The Cotter's Saturday Night" (1854); "Catherine Seyton" (1864); "Tam o' Shanter"; "The Stirrup Cup" (1867); "John Anderson, My Jo" (1869); "Blenheim" (1875); "The Great Hall at Haddon" (South Kensington Museum); "Annie's Tryst" and "The Poet's Dream" (National Gallery, Edinburgh); "The Gamekeeper's Daughter"; and "The Hiring Fair."

FAED, THOMAS (1826-1900). A Scottish genre and historical painter. He was born at Barlay Mill and was a brother of John Faed, from whom he derived his first instruction. He studied at the Edinburgh School of Design under Sir William Allen and Thomas Duncan. In 1849 he became an associate of the Royal Scottish Academy, and shortly afterward painted his attractive "Scott and his Friends at Abbotsford," widely known through its engraving by his brother James. In 1852 he removed to London, where his reputation was established by his "Mitherless Bairn" (Melbourne Gallery), exhibited in 1855. Among his subsequent works are: "Home and the Homeless" (1856); "The First Break in the Family" (1857); "From Dawn to Sunset" (1861); "Baith Faithair and Mither" (1864); "Forgiven" (1876); "The Silken Gown"; "Faults on both Sides"; "The Young Highland Mother"; "The Poor and the Poor Man's Friend"—the four last named in the Tate Gallery, London; and "Rest by the Stile" in the Vanderbilt collection (Metropolitan Museum, New York). Faed was elected a member of the Royal Academy in 1864 and an honorary member of the Vienna Academy in 1875. Owing to the failure of his eyesight, he ceased work in 1892. His pictures are interesting rather for their subjects, sentimental or pathetic incidents in humble Scottish life, than as paintings. They are, however, good in draftsmanship and conscientious in execution. They are very popular and have been much reproduced in engraving.

FAENZA, fā-en'zā (Lat. *Faventia*, from *favere*, to favor). An episcopal city of Ravenna, north Italy, on the Lamone (ancient Anemo),

31 miles southwest of Bologna (Map: Italy, C 2). From Faenza comes faience ware, for the manufacture of which the city was famous in the fifteenth century. On Vittorio Emanuele Square, where the four main streets meet, are the city hall, which was once a palace of the Manfredi, the beautiful church of San Michele, the modern theatre, and the fifteenth-century cathedral of San Costanzo, who was the first Bishop of Faenza. The square is surrounded by arcades and has a seventeenth-century fountain in the centre. The cathedral is a basilica, begun in 1474, containing many works of art, among them a Holy Family by Innocenzo da Imola, and the tomb of St. Savinus by Benedetto da Majano (1472). In the municipal art gallery are paintings by artists of the Romagna, and splendid collections of majolica ware. The city has a library, a gymnasium, a technical school, a lyceum, and a school of design. The most important industries are the manufacture of majolica and faience ware, furniture, vehicles, dyes, and leather; the spinning and weaving of silk, and sulphur refining. An important trade in wine, silk, and hemp is carried on. In 82 B.C. Faventia was the scene of a victory of Sulla over Carbo, and in 542 A.D. Totila here defeated the Byzantines. Later it became a part of the Exarchate, was captured in 1241 after an eight months' siege by Frederick II, and in 1313 came into the possession of the Manfredi. In 1509 Julius II united it to the Papal States. It is the native place of the physician Toricelli, inventor of the barometer, to whom a monument has been erected. Pop. (commune), 1901, 40,370; 1911, 40,164.

FAERIE (fā'ēr-i) **QUEENE**, THE. An allegorical romance of chivalry, by Edmund Spenser. Of the 12 books contemplated, six were published (1590 and 1596), but only fragments of later books appeared. Each book is divided into 12 cantos, telling the legend of a knight who represents one of the chief virtues—Holiness, Temperance, Chastity, Friendship, Justice, Courtesy. Of another book, on Constancy, only a fragment is extant.

FAESULÆ. See **FIESOLE**.

FAFNIR, fāf'nēr (Icel., Embracer). In Norse mythology, the son of the giant Hreidmar. In the shape of a dragon he guarded the treasure later known as the *Nibelungenhord*, and was killed by Sigurd.

FA'GAN, JAMES BERNARD (1873-). An Irish playwright. He was educated at Clongowes Wood College, and at Trinity College, Oxford. He studied law, and engaged in the Indian Civil Service for a time. In 1895-97 he went on the stage with F. R. Benson's company, in 1897-99 played with Beerbohm Tree's company in Her Majesty's Theatre, and in 1913 returned after retirement to play the rôle of the Rt. Hon. Denzil in his own play, *The Earth* (1909). His other plays include: *The Rebels* (1899); *The Prayer of the Sword* (1904); *Under which King* (1905); *Shakespeare versus Shaw* (1905); *Hawthorne, U. S. A.* (1905); *A Merry Devil* (1909); *The Dressing Room* (1910); *Bella Donna*, an adaptation (1911); *The Happy Island* (1913).

FAGEL, fā'kēl, FRANS NICOLAAS, BARON (1645-1718). A Dutch general, a nephew of Kaspar Fagel, born at Nimeguen. He distinguished himself at Fleurus (1690) and commanded at the defense of Mons (1691) and at the siege of Namur (1695). As lieutenant gen-

eral, he led the army at the siege of Bonn (1703) and fought at Ekeren (June 30, 1703). Transferred in 1704 to the army in Portugal, he stormed Valencia (1705) and Albuquerque and besieged Badajoz. Upon his return to Holland he fought at Tournai, Ramillies, and Malplaquet, besieged Béthune, forced the passage of the Scheldt (1712), and captured Le Quesnoy. After the Peace of Utrecht he was Governor of Sluis.

FAGEL, HENDRIK, BARON (1705-1834). A Dutch statesman. He studied at Leyden and in 1787 was appointed second secretary of the States-General. He soon afterward succeeded his grandfather as secretary, being the sixth member of the family to occupy that position since 1672. In 1794 he was appointed, in association with Van de Spiegel, to conclude an alliance with Prussia and England. He shared the exile of the princes of Orange and after his return to Holland in 1813 was Ambassador to England for 11 years. In 1814 he and Castlereagh signed the important Convention of London which restored many Dutch colonies to Holland. He became Minister without portfolio in 1829.

FAGEL, KASPAR (1629-88). A Dutch statesman, born at The Hague. In 1663 he became pensionary of Haarlem, in 1670 secretary of the States-General, and in 1672 grand pensionary to succeed De Witt. He believed in the ability of William of Orange to redeem Holland from its perilous position and with Van Beuningen and Valckenier attached himself to the fortunes of that prince. On his suggestion the hereditary stadtholdership was in 1674 conferred upon William. He prepared the way for the accession of William to the throne of England. He is said to have refused a bribe of 2,000,000 francs from Louis XIV.

FAGERLIN, fä'gër-lén, FERDINAND JULIUS (1825-). A Swedish genre painter, born at Stockholm. Originally a shipbuilder, he was later for a time in the military service, but after some amateur work, especially in portraiture, from 1854 adopted art as his profession. After study at the Academy of Stockholm, at the Düsseldorf Academy under Karl Sohn, and under Couture in Paris, he settled in Düsseldorf, where he was appointed to a professorship in the Academy in 1893. He was early influenced by Henry Ritter, and his most important work is done in genre. In particular, his naïve and sympathetic characterizations of Dutch fisher life have ranked him among the principal Swedish artists. His canvases of this sort are generally faithful in detail, touched by a quiet humor, and good in color. They include: "Jealousy" (Stockholm Museum); "The Deserter," "The Return from the Shore," and "A Cosy Home" (Berlin Gallery), and "The Bashful Suitor" (Düsseldorf Gallery).

FAGGING. A term of uncertain origin used in the "public schools" of England. The services of a fag are of two kinds—the one comprising his duties to a special upper-form boy, to whom he has been assigned; the other consisting of those due to the whole of the upper boys. The former comprise such tasks as preparing his master's breakfast, making his master's fire, carrying his master's messages, and smuggling into the house little forbidden delicacies for his master's consumption, and in this instance, if detected, bearing his master's punishment. Those services which a lower boy owes to the whole of the upper boys are summed up in attendance at

the games. In the cricket season fags stand behind the wickets to stop the balls while their seniors are practicing; and at all seasons they are liable to the task of waiting attendance on the racket players and retrieving the balls which have been "skyed" out of the court. No boy, however, is liable to an imposition really menial. All cases of difficulty arising out of fagging are within the jurisdiction of the head boy in the house or the head of the school and are settled by reference to the one or the other. Until about 1870 the system of fagging was subject to gross abuses, and, while those who survived may have been the better for the severe discipline, many boys were either driven out of school or carried away lasting impressions of the hardships. The system has, however, been better regulated and with the prefect or monitorial system is probably an important factor in the training of the English "public school" boy. Consult Hughes, *Tom Brown's School Days*.

FAG'GOT WORM. A Ceylonese bagworm (*Eumeta carmeti*), whose pupa case resembles a bundle of small faggots. It occurs on the coffee bushes, and the natives say that they represent the souls of dead men and women who in life were persistent thieves of firewood and are thus punished. See **TEA INSECTS**.

FAGIN, fä'gín. The Jew in Dickens's *Oliver Twist*, a receiver of stolen goods, who trains up a gang of thieves and pickpockets. He abducts Oliver Twist and is finally condemned to death for murder.

FA'GIUS (Latinization of his German name *Buchlein*), **PAUL** (1504-49). A German divine and Hebraic scholar. He was born at Rheinzaubern in the Palatinate. After completing his academic studies at Heidelberg, he removed to Strassburg, where he was a pupil of Wolfgang Capito, the famous Hebraist. In 1537 he became pastor at Isny, where also he received instruction in Hebrew from Elias Levita, whom he brought from Venice to assist him in his studies. He established a Hebrew printing press and published many works of interest to Oriental scholars. His reputation as a Hebraist in 1542 secured for him invitations to the chair of Hebrew at Strassburg, Constance, and Marburg, and after holding professorships in these cities he went to Heidelberg in 1546 to aid the party of the Reformation in the University. After his deposition in 1549 because of his refusal to obey the Interim, he was invited by Archbishop Cranmer to come to England, where he died soon after his arrival at Cambridge. In 1557 his body was exhumed and burned under orders from Queen Mary. He wrote a *Hebrew Grammar* (1543) and various commentaries on the Old Testament—none now of any importance save historically.

FAGNANI, fä-nyä'nä, JOSEPH (1819-73). An Italian portrait painter. He was born at Naples, and studied at the Academy there and in Vienna and Paris. He traveled extensively, and came to the United States with Sir Henry Bulwer in 1849. He made portraits of a large number of public characters, among them Victor Emmanuel, Abd-ul-Aziz, Garibaldi, the Empress Eugénie, Ali Pasha, and President Taylor, and painted a series of portraits of the most beautiful women of New York, called "The Nine Muses," which are now in the Metropolitan Museum of Art, New York. His work was popular in his day, but is of mediocre quality and has no enduring value.

FAGNIEZ, fâ'nyä', GUSTAVE CHARLES (1842-). A French economist and historian. He was born in Paris and was educated at the Ecole des Chartes and the Ecole des Hautes-Etudes. For a time he was employed in the national archives, and later he became a member of the commission of diplomatic archives under the Minister of Foreign Affairs. He also gave a course at the Sorbonne. He was one of the founders and a president of the Historical Society of France, and one of the editors of the *Revue Historique*. His writings, dealing largely with economic history, include: *Etudes sur l'industrie et la classe industrielle à Paris au XIIIe et au XIVe siècle* (1877); *La mission du père Joseph à Ratisbonne* (1885); *Le père Joseph et Richelieu* (1894); *L'Economie sociale de la France sous Henri IV* (1897); *Documents relatifs à l'histoire de l'industrie et du commerce* (2 vols., 1898-1900); *Le duc de Broglie* (1902); *Corporations et syndicats* (1905).

FAGOTIN, fâ'go'tän'. A monkey, famous in Paris for his cleverness in the days of Molière, and frequently mentioned in the literature of that time.

FAGOTTO. See BASSOON.

FAGUET, fâ'gê', EMILE (1847-1916). A French critic, journalist, and literary historian, born at La Roche-sur-Yon. After teaching in the provinces he became professor of poetry at the Sorbonne in 1890 and in 1901 was elected to the Academy. His works include: *La tragédie au XVIIe siècle* (1883); *Le théâtre contemporain* (1880-91), comprising his dramatic criticisms; *Dix-huitième siècle* (1890); *Seizième siècle* (1893); *Drame ancien, drame moderne* (1898); *Histoire de la littérature française* (1900); *La politique comparée de Montesquieu, Rousseau et Voltaire* (1902); *Propos littéraires* (1902); *Le Pacifisme* (1908); *Les préjugés nécessaires* (1911); *Monseigneur Dupanloup, un grand évêque* (1914). In 1914 his *Initiation into Literature and Initiation into Philosophy* were published in English, trans. by Sir Home Gordon. His style is most modern and vivacious, continually sparkling with brilliant and clever sayings. His hostility to dogmatism, keen powers of analysis, and richness of personal ideas make him a most constructive critic. By means of his monographs (on most of the literary geniuses of the last five centuries) he rehabilitated especially the literature of the seventeenth century, but he did this at the expense of eighteenth-century writers. He took an active interest in the criticism of the modern drama, of politics, and even of philosophy. Consult V. Giraud, "M. Emile FAGUET," in *Revue des Deux Mondes* (Paris, 1909).

FA'GUS. See BEECH.

FAHA'KA. A globe-fish (*Tetraodon fahaka*) of the Nile delta.

FA HIEN, fâ hê-en'. A Chinese Buddhist monk and traveler. He was a native of Wu-yang, in the Province of Shan-si. During the years 399-414 A.D. he traveled extensively in India, Khotan (Yu-thän), where he witnessed a great Buddhist festival, and Tibet in company with Hui King and other Chinese pilgrims. From Khotan he journeyed through Kashmir, Kabul, Kandahar, and the Punjab, to Central India, which he reached in 405, after six years of wandering. He remained in India for about 10 years, seeking complete copies of the *Vinaya-pitaka* and compiling information regarding Buddhism and the life of its founder, and then

went to Ceylon where he copied many sacred texts. From there he embarked for Java, and arrived at his home in China once more in 414. After his return he wrote an account of his travels, called *Fô-kue-ki*, or story of the Buddhist countries. This journal is concise and chiefly taken up with a description of the sacred spots and objects of the Buddhist faith, which was at that time the dominant religion in India. The narrative has been translated into French by Rémusat (Paris, 1836) and into English by Beal (2d ed., London, 1884); Giles (Shanghai, 1877), and Legge (Oxford, 1886). He died in the monastery of Sin at the age of 88 years. Consult the introduction to Legge's translation: Beazley, *Dawn of Modern Geography*, vol. i (3 vols., Oxford, 1904-06); Giles, *History of Chinese Literature* (New York, 1901).

FAHLCRANTZ, fäl'kränts, CHRISTIAN ERIK (1790-1866). A Swedish poet and theologian, born at Stora Tuna (Province of Falun). He wrote several long poems and some controversial works. From 1839 to 1852 he published, with the collaboration of Knüs and Almqvist, an *Ecclesiastical Journal*. In 1849 he was made Bishop of Westerås. His most important work is *Noach's Ark* (1825-26), a humorous and satirical poem. Besides this may be mentioned *Ansgarius* (1835-46). The collected works of Fahlcrantz have been published under the title *C. E. Fahlcrantz: Samlade Skrifter* (7 vols., Örebro, 1863-66).

FAHLCRANTZ, KARL JOHAN (1774-1861). A Swedish landscape painter, brother of the preceding, born at Stora Tuna. He was a pupil of Ljung, but studied directly from northern scenery and later imitated Ruysdael and Everdingen. He had the exaggerated enthusiasm for Nature typical of the Romantic school, and idealizes, intensifies, and strives after the fantastic. His color is warm though dark in tone, and at his best his pictures are full of sentiment. The most popular are those illustrating Tegnér's *Frithjof Saga*. The Stockholm Museum possesses the "Castle of Kalmar in the Moonlight" and a landscape; the Christiania Gallery, "A Forest Site."

FÄHLMANN, fäl'män, FRIEDRICH ROBERT (1800-50). A Russian philologist. He was born in Esthonia and studied medicine and philology at Dorpat, where in 1842 he became lecturer on the Esthonian language. He collected and edited the material constituting the *Kaleviade* or *Kalevipoeg* (The Son of Kalev), which was published after the death of Fählmann by his biographer, Kreutzwald (1857-61).

FAHNE, fâ'ne, ANTON (1805-83). A German jurist and historian. He was born at Münster and was educated in medicine, theology, and law at Bonn and Berlin. He wrote many special histories of bishoprics, cities; and noble families which contributed valuable details to the history of Westphalia and the Rhine District. These works include: *Forschungen aus dem Gebiet der rheinischen und westfälischen Geschichte* (5 vols., 1864-75); *Denkmale und Ahnentafeln in Rheinland und Westfalen* (6 vols., 1879-83); and the interesting book on Livonia, entitled *Livland: Ein Beitrag zur Kirchen- und Sittengeschichte* (1875).

FAHRENHEIT, fâ'ren-bit, GABRIEL DANIEL (1686-1736). A German physicist, who made several important improvements in the thermometer. He was born in Danzig. His inclina-

tion for scientific research induced him to give up mercantile pursuits, and, having traveled through Germany and England, he settled in Holland, becoming a manufacturer of meteorological instruments. In 1720 he was the first to bring about the general practice of using mercury instead of alcohol in the construction of thermometers, which had been originated by Boilliou in 1659. With the new mercury thermometers the accuracy of the instrument was very much improved, and this was partly secured through a method for cleaning the mercury invented by Fahrenheit. He also devised the scale of graduating the thermometers known by his name and discovered that other liquids besides water had a fixed boiling point, and that the boiling point varied with a change in the pressure of the atmosphere. (See THERMOMETER.) In 1724 Fahrenheit was elected a fellow of the Royal Society of London, and the *Philosophical Transactions* of that year contain five short papers by him on physical subjects. These, with articles on thermometry by Reaumur and Celsius translated into German, are to be found in *Ostwald's Klassiker*, No. 57 (Leipzig, 1894).

FAIDER, fâ'dêr, CHARLES JEAN BAPTISTE FLORENT (1811-93). A Belgian jurist and statesman, born at Triest. He was admitted to the bar in 1832, in 1844 became Advocate-General in Brussels, in 1846 a member of the Royal Academy, and in 1851 Advocate-General in the Court of Cassation, to which post he returned after being Minister of Justice (1852-55). He published an *Histoire des institutions politiques de la Belgique* (1874) and other works on constitutional law.

FAIDHERBE, fâ'dâr'b', LOUIS LÉON CÉSAR (1818-89). A French soldier, born at Lille. He began his military career in Algeria, was a captain in Guadeloupe in 1848 and in Algeria in 1851-52, and in 1854 was made Governor-General of French Senegal, where he reorganized the government and extended the French territory, by waging a war of extermination against the Prophet El-Hadji Omar, who had formed the project of driving out all foreigners and founding an immense Mohammedan empire in Central Africa. A satisfactory treaty was made with Omar in 1863. In the war with Germany Faidherbe received from Gambetta the command of the Army of the North and fought bravely against odds at Bapaume and at Saint-Quentin. In 1871 he was a member of the National Assembly and in 1879 was elected a senator. He was the author of valuable works on the geography, anthropology, and philology of Senegal and Algeria, including *Épigraphie phénicienne* (1873); *Instructions sur l'anthropologie de l'Algérie* (1874); *Essai sur la langue poul* (1875); *Le Zénaga des tribus sénégalaises* (1877); *Langues sénégalaises* (1887); *Le Sénégal* (1889). His military memoirs, *Campagne de l'armée du Nord* (1871) aroused Von Goeben to a reply from the German point of view. Consult Brunel, *Le général Faidherbe* (2d ed., Paris, 1897).

FAÏENCE, fâ'Ûns' (Fr. from It. *faenza*, *faïence*, for *porcellana di Faenza*, earthenware of Faenza, a city of Italy). Properly speaking, the term should refer to majolica manufactured at Faenza. At the time when the Italian potters introduced this ware into France Faenza was the most important centre of the manufacture in Italy. The term was therefore adopted as the designation for all manner of pottery other than unglazed pottery or porcelain. It is used in

English to designate any earthenware of coarse fabric, covered with an opaque enamel (upon which decoration may be applied in vitrifiable paint) and fired. The process of manufacture includes three wholly distinct operations—the molding and firing of the original clay, often not more delicate than a cheap flowerpot; the covering with enamel, which is often done by mere dipping, and the firing of this; and, finally, the decoration, which is subsequently fired. The famous majolica (q.v.) is therefore a variety of faïence in the English sense; while stoneware, including the so-called *faïence Henri Deux* and *faïence Saint-Porchaire* (q.v.), is not properly faïence in the English sense; neither are porcelain or other wares not covered all over with a thick enamel, including those decorated with slip, and all the varieties of Greek vases and Japanese hard, yellow pottery with crackled glaze. On the other hand, tiles and bricks, of which the surface is covered with an opaque material upon which alone the painting is applied, as in the monuments of the early Persian kingdoms, in many of those of Egypt, and in the splendid tiles which sheathe and line the walls of mosques in Cairo and Damascus, are faïence in the strictest sense.

The wares to which the term is most commonly applied in the language of students of pottery are the French pieces of the sixteenth, seventeenth, and eighteenth centuries. These are especially the manufacture of Rouen, which as early as 1520 was turning out tiles of great beauty, including frequently painting in figure subjects, and in those curiously emblematic compositions which were the delight of designers of that time. The most important development began in the late seventeenth century. These wares were sometimes plain white and blue, and are then of extreme beauty, not closely copied from Chinese originals, like the Delft pieces named below, but designed with great freshness and novelty in the spirit of the French Renaissance. At a later time deep red was introduced, so that the three colors—red, blue, and white—were somewhat easily balanced in the composition, which was in a few cases relieved by gold. These pieces were made for table use even in the wealthiest families, and during the wars of Louis XIV's reign, when it became fashionable to send silverware to the mint, splendid services were made for the royal establishment at Versailles and for the nobles of the court. The exclusive taste for this ware disappeared at the time of the discovery of what is called soft porcelain at the close of the eighteenth century; but the factories flourished down to the end of the eighteenth century and left their traces in the peasant potteries of the Cevennes and the south. In the mountain regions of Italy very interesting faïence is still made by village potters on good old lines of decoration.

One of these famous wares is that of Nevers, which is marked by a much freer use of landscape designs than that of Rouen, and, when the composition is not actually pictorial, by a much less restricted and carefully designed style of ornamentation, as if copied from the most elaborate designs for brocade. The factory seems to have been established about 1550, and it flourished as late as that of Rouen, though it was never equally extensive. The vases and dishes of Moustiers are famous for their exquisite decoration in conventional flowers arranged in scrolls and festoons, these last being

the especial mark of the richer pieces. There are also splendid pieces with coats of arms and a conventional decoration of great solidity and dignity, reminding the student of the finest ware of Rouen. The first manufactory was established at Moustiers-Sainte-Marie in Provence about 1640. There are famous wares which were made in Alsace, at Strassburg, and Niederweiler, and also at Marseilles, where realistic flowers of large size were painted on plates and dishes in a most effective way. Lunéville and Saint-Clément in Lorraine, Rennes in Brittany, Lille, and Valenciennes in the extreme north of France, Lyons, and, in the neighborhood of Paris, Sceaux, Sèvres, Montereau, and many other places, were famous throughout this epoch.

During the same period the manufacture of faience at Delft in Holland assumed great importance. Beginning about 1600, it produced the most perfect works from about 1650 till early in the eighteenth century. The great popularity of the ware then led to overproduction and artistic decline, and at the end of the century it was replaced by the more practicable porcelain. In late years, however, the manufacture has been revived. In Delft the decoration was usually painted in blue upon the white enamel after the first firing. It was then covered with transparent lead glaze and fired a second time. Some pieces were closely copied from blue and white Chinese porcelain, the resemblance being never complete, because of the different effect of the white background, and also of the blue painting from that of the Chinese ware, but having an especially attractive appearance of its own. There were landscapes often of large size and painted on plaques, square and oblong, of considerable size, often let into chimney pieces above the fireplace and the like, and also scenes of domestic life, real genre painting, but usually confined to pure blue and white; and similar subjects were painted on small tiles, four or six inches square, many tiles being included in one design. Finally, there are the imitations of the splendid wares of Rouen and other French manufactories, in which case several colors are used. The ware was exported in such immense quantities as to give the name "Delft" to any faience used in England, and a similar name, spelled "Delphes" or in some such way, in France. The well-known ware manufactured at Lambeth (now a part of London) is a variety of Delft, which was produced throughout the seventeenth century, as were also similar wares at Bristol and Liverpool. Delft ware was manufactured in Germany at Hanau, Frankfort, and Cassel.

Faience, in the strict sense, was less common in the nineteenth century, because much tougher wares were made. The beautiful dishes of Delft and Rouen break very easily and are too soft to be repaired in a lasting way. In France, however, many beautiful wares of this kind were made for table use. A breakfast set in faience, with delicate white glaze of peculiar softness, and painted with realistic flower pattern, would cost only half as much as a porcelain set, no more attractive to the eye, but harder, and, on the whole, more agreeable in use as well as more enduring. In Italy several factories produce modern imitations of ancient majolica and other pieces designed more or less in close agreement with ancient work; and these are genuine faience. Most generally, however, the choicer modern wares, whether for use or adornment, are of

some variety of stoneware, of "ironstone china," of terra cotta, or of porcelain. See MAJOLICA; PORCELAIN; POTTERY; STONEWARE.

The best collections of French faience are in the Musée de Cluny (Paris), in the Louvre and at Sèvres, and also in the French provincial museums; of the Delft ware in the museums of The Hague and Amsterdam, as well as in one of the manufactories at Delft. There are also good collections in the Victoria and Albert and British museums, London, and in the Morgan collection (Metropolitan Museum, New York).

Consult: Garnier, *Dictionnaire de la céramique* (Paris, 1893); Ris-Paquot, *Manuel du collectionneur des faïences anciennes* (ib., 1877); Deck, *La faïence*, a volume of the *Bibliothèque de l'enseignement des beaux-arts* (ib., 1887), by a practical workman of merit; Gasnault and Garnier, *French Pottery* (London, 1884); Milet, *Historique de la faïence et de la porcelaine de Rouen* (Rouen, 1898); Abbe Requin, *Histoire de la faïence artistique de Moustiers* (Paris, 1903); Solon, *The Old French Faience* (London, 1903), the best manual in English. For Delft ware, consult Havard, *Histoire de la faïence de Delft* (Paris, 1878).

FAILLON, fá'yón', MICHEL ETIENNE (1799-1870). A French missionary and author, born at Tarascon, France. He became a Sulpician monk in Paris, taught in Paris and Lyons, and in 1854 went to Canada on a tour of inspection of the various houses of that order in America. He had been in Canada before in 1849-50, and he was there again in 1857-62. His contributions to Canadian religious biography embrace lives of *Margaret Bourgeoys*, founder of the Congregation Sisters (1854); *Madame d'Youville*, founder of the Grey Sisters (1852); *Mademoiselle Maur*, founder of the Hôtel Dieu (1854); *Mademoiselle le Ber*, the recluse (1860); *Histoire de la colonie française en Canada* (3 vols., 1865-66), bringing the narrative to 1875.

FAILLY, fá'yé', PIERRE LOUIS CHARLES DE (1810-92). A French soldier. He was born at Rozoy-sur-Serre, was educated at the military school at Saint-Cyr, and joined the army in Algeria. At the outbreak of the Crimean War he was made a brigadier general. He commanded a division in the Italian campaign in 1859 and fought at Magenta and Solferino. In 1867 he commanded the corps sent to aid the Pope against Garibaldi, whom he defeated at Mentana on November 4. At the beginning of the Franco-Prussian War Napoleon placed him in command of the Fifth Army Corps. On August 30, 1870, while commanding the right wing of MacMahon's army at Beaumont, he was surprised and forced to retreat, leaving MacMahon's flank unprotected, and cutting off his retreat, which forced capitulation after the battle of Sedan. Failly was relieved of his command on the morning of the battle, being succeeded by General Wimpfen. After the war he lived in retirement. He published a defense of his military operations before Sedan, *Campagne de 1870: Opérations et marche du 5ème Corps jusqu'au 31 août* (1871).

FAILSWORTH. A town of Lancashire, England, on the Lancashire and Yorkshire Railway, 4 miles northeast of Manchester. It has extensive cotton-manufacturing industries. The district gets its water and gas from Oldham, while the corporation of Manchester supplies a tramway service and electric lights. Pop., 1901, 14,152; 1911, 15,098.

FAILURE OF DAMS. See DAMS AND RESERVOIRS.

FAIN, fän, AGATHON JEAN FRANÇOIS, BARON (1778-1837). A French historian, secretary to Napoleon I. He was born in Paris. After having served under the Directory, he was in 1806 appointed secretary of the Imperial archives, in 1809 was made Baron, and in 1813 became private secretary to the Emperor, whom he accompanied on all his tours until 1815, when he drew up the papers in which Napoleon definitely abdicated the throne of France. In 1830 he became first secretary of the cabinet under Louis Philippe, and was several times intrusted with the administration of the Civil List. He was deputy from Montargis in 1834-37. He wrote some readable and accurate memoirs, dealing chiefly with the later years of the reign of Bonaparte, such as *Manuscrit de 1814, contenant l'histoire des six derniers mois du règne de Napoléon* (1823; 4th ed., 1906); *Manuscrit de 1813* (2 vols., 1824; 2d ed., 1825); *Manuscrit de 1812* (2 vols., 1827); *Manuscrit de Van III* (1828). Fain's *Mémoires*, published in 1908, constitute a valuable addition to his earlier works.

FAINÉANT, fä'nä'än', LE NOIR (Fr., the black sluggard). A name given in Scott's *Ivanhoe* to Richard Cœur de Lion, disguised as the Black Knight.

FAINÉANTS, fä'nä'än' (Fr., do-nothings). A designation especially applied to the later Merovingian sovereigns of France, in whose name the mayors of the palace really governed the country. See MAJOR DOMUS.

FAINTING (from OF. *faint*, *feint*, p.p. of *feindre*, to feign, from Lat. *fingerē*, to fashion), or **SYNCOPE**. Loss of consciousness, of sensation, and of power of motion, with pallor of the face, temporary cessation of respiration, and temporary feebleness of the heart, with loss of pulsation at the wrist. It is caused by anæmia of the brain, due to temporary heart failure from shock, great weakness or exhaustion, loss of blood, or disease of the heart. Sudden emotion, as fright, excessive joy or grief, may cause fainting in a neurasthenic person. In all cases of fainting the clothing which may impede breathing should be loosened, and the patient should be placed on the back, with the head and chest lower than the abdomen and legs. In a protracted faint whisky may be drunk and ether, camphor or strychnia may be given hypodermatically. In heart disease and in severe injuries the patient may die without regaining consciousness. See HEART, DISEASES OF THE.

FAIR (OF. *feire*, *foire*, Fr. *foire*, It. *fiera*, fair, from Lat. *feria*, holiday; connected with Lat. *festus*, feast). A meeting held for the purpose of exhibiting or selling goods. Originally fairs were held at stated times and places, some for the sale of a particular class of merchandise, others for the sale of goods of a general character. People resorted to them to exchange goods and to collect their stores to last for several months. Princes and the magistrates of cities encouraged them, and some of the privileges granted still remain in places. With the crowding together of people in large cities and the rise in rent, the collection of a store of goods to last longer than a few days became impossible, so the original function of the fair ceased to exist. They flourish mostly to-day on the outskirts of civilization, where the means of

communication are defective. In Europe they appear to have originated in the church festivals, which were found to afford the best opportunity for commercial transactions, the concourse of people being such as took place upon no other occasions. In Western Europe the goods exposed for sale are chiefly those of which there is a frequent change of fashion. Provisions are seldom an article of sale in them; and while in some parts of the Continent persons of all ranks still wait for the great yearly fairs to make their principal purchases of articles of every description, such as corn, wine, spirits, tea, coffee, etc., these articles are seldom seen in them.

One of the most noted of English fairs was that of St. Bartholomew, Smithfield, London, founded at the beginning of the twelfth century. They grew in importance in the twelfth and thirteenth centuries, but declined in the fifteenth century, and at the close of the reign of Queen Elizabeth they had degenerated into resorts for pleasure seekers. The Bartholomew, Greenwich, Glasgow, and Donnybrook fairs are examples of these.

The greatest fairs in Germany are those of Leipzig, Frankfort on the Main, Frankfort on the Oder, and Brunswick. At the first-named meetings are held three times a year—New Year's, Easter, and on the Feast of St. Michael—and it is estimated that \$50,000,000 worth of goods are sold. Other noted European fairs are those of Zurzach in Switzerland, Budapest in Hungary, Sinigaglia and Teramo in Italy, Beaucaire and Lyons in France, and Nizhni Novgorod in Russia. The last named, beginning in July and lasting eight weeks, is frequented by buyers and sellers from all parts of Europe and northern and central Asia, and it is said that merchandise to the value of over \$100,000,000 is sold. Outside of Europe the most important fairs are those of Tanta in Upper Egypt, Kiakhta and Irbit in Siberia, Hurdwar in India, and Mecca in Arabia. The last-named fair is held at the time of the annual pilgrimage, and over 100,000 people visit it.

In the United States there are no fairs of the kind that have been common in the Old World; but the term is applied to a variety of exhibitions, such as church, charity, and agricultural fairs, and local, State, national, or international expositions or fairs. In fact, the term is applied to all exhibitions where people are expected to bestow patronage or to make purchases. At church or charity fairs articles, chiefly of the fancy sort, are sold. The most common kind are the agricultural fairs, county and State. Elkanah Watson, a prosperous merchant of Albany, N. Y., was the originator of these. Mainly through his influence the New York Legislature appropriated, in 1810, \$10,000 a year for six years, for premiums on agricultural products and family manufactures. Since then annual State fairs have become quite general, and many States appropriate funds to aid them. The most common fairs are the annual county fairs, where live stock and all kinds of vegetable products and manufactured goods are exhibited, and premiums are awarded to the possessors of the best grades. These fairs are not held primarily for the purpose of selling commodities at the fair, but largely for advertising purposes. The city street fairs, where amusements of various kinds are furnished, are intended to promote the welfare of the city by attracting traders to them.

The world's fairs or expositions (see EXHIBITIONS), and the international or State fairs, which have become famous within the last half century, are chiefly educational in character and are adapted to the commercial life of the present, with its rapid means of communication, its populous cities, and production on a large scale, as the old fair, with its convenient meeting ground for buyers and sellers, was adapted to the commercial life of a few centuries ago. These fairs are intended to promote the interests of the city and nation or State in which they are held and to furnish an excellent opportunity for the advertisement of all classes of goods. While commodities are sold at these fairs, the primary purpose of them is to advertise.

FAIR, JAMES GRATHAM (1831-94). An American capitalist, born near Belfast, Ireland. He came to the United States in 1843 and went to California on the breaking out of the gold fever in 1849. After 1860 he was engaged in the mining of gold and silver in Nevada and amassed great wealth. In 1867 he entered into partnership with J. C. Flood, W. T. O'Brien, and J. W. Mackay in several large mining projects. He was elected as a Democrat to the United States Senate in 1881 and served one term (1881-87).

FAIRBAIRN, ANDREW MARTIN (1838-1912). Principal of Mansfield College, Oxford. He was born near Edinburgh, and was educated at Edinburgh, Glasgow, and Berlin universities. He commenced his ministry in 1860 at Bathgate, removed to Aberdeen in 1872, became principal of Airedale College, Bradford, England, in 1877, lecturing at Edinburgh (1881-83) on the "Comparative History of Religions." In 1883 he was selected as chairman of the Congregational Union of England and Wales, and in 1886 removed to Oxford, to become the principal of Mansfield College. He made several lecturing visits to the United States and published, among other books: *Studies in the Philosophy of Religion and History* (London, 1876); *Studies in the Life of Christ* (1881); *The City of God* (1883); *Religion in History and in the Life of To-Day* (1884); *The Place of Christ in Modern Theology* (1893); *Catholicism, Roman and Anglican* (1899); *The Philosophy of the Christian Religion* (1902). He was a member of the Welsh Church Commission appointed in 1906.

FAIRBAIRN, PATRICK (1805-74). A clergyman of the Free Church of Scotland, born at Hallyburton, Berwickshire. He was educated at Edinburgh, and licensed to preach in 1826. When the disruption occurred (1843), he joined the Free Church. He became professor of divinity in the Free Church College in Aberdeen (1853), was transferred to the similar institution in Glasgow (1856), and made principal the same year. His biblical works had a wide circulation, but possess little permanent value. His reputation rests upon his *Typology of Scripture* (1845-47; 6th ed., 1880); *Prophecy* (1856; 2d ed., 1866); *Hermeneutical Manual* (1858); *Pastoral Theology* (1875), with sketch of his life by J. Dodds.

FAIRBAIRN, SIR WILLIAM (1789-1874). An English engineer, born at Kelso in Roxburghshire, Feb. 19, 1789. He learned a little reading, writing, and arithmetic at the parish school of Mullochy in Ross-shire, and after some six months' instruction from an uncle he was apprenticed to a machinist at Percymain Colliery, North Shields. When his apprenticeship terminated, Fairbairn worked for two years in

London and then visited many places in England, Wales, and Ireland, working a short time at each, in order to observe the various practices of different localities. Eventually he commenced business on his own account in Manchester in 1817. The first great improvement introduced by Fairbairn was the substitution of iron for wood in the shafting of cotton mills, and the substitution of light for heavy shafting where metal was already in use. This exchange economized the cost of machinery and enabled the shafting to be speeded from 40 to 160 revolutions per minute. Fairbairn was among the earliest of the iron ship builders and originated various improvements in ship construction.

The first idea of a tubular bridge across the Menai Strait was due to Robert Stephenson, but its realization was largely due to Fairbairn. He was president of the British Association for the Advancement of Science (1861-62) and was created Baronet in 1869. His son THOMAS was chairman of the art treasures exhibition at Manchester (1857), was a commissioner for the exhibitions of 1851 and 1862, and was in 1857 offered the honor of knighthood, which he declined. Fairbairn published: *On Canal Steam Navigation; The Strength and Other Properties of Hot and Cold Blast Iron; The Strength of Iron at Different Temperatures; The Strength of Locomotive Boilers; the Effect of Repeated Meltings on the Strength of Cast Iron; The Irons of Great Britain; The Conway and Britannia Tubular Bridges; Useful Information for Engineers*, 1st, 2d, and 3d series; *A Treatise on Mills and Mill Work*. Consult Pole, *Life of Sir William Fairbairn, Bart.* (London, 1877), and Smiles, *Lives of the Engineers* (ib., 1874).

FAIRBANKS. An incorporated city situated on the Tanana River, Alaska, practically at the head of navigation (Map: Alaska, K 3), and the largest city in the Territory, having a population of 3541 in 1910. It is the site of the Fourth Judicial District and of government activities in the interior of Alaska. Its importance arises from its being the commercial centre of the Fairbanks gold-mining district. The Tanana Valley Railroad, 45 miles in length, connects it with Chena (pop., 138 in 1910), and with the principal mining camps of the adjacent regions. Fairbanks is a modern city, being largely heated by a central steam plant; has schools, churches, hospitals, wireless and telegraph connection with the world; has newspapers, long-distance telephone system, fire department, and an electric plant that not only serves the city, but also furnishes light and power to adjacent mining camps. It is reached during the entire year by a stage service of 354 miles from Valdez, and during five months in summer has steamboat service westward to St. Michael and eastward to Dawson and White Horse, Yukon Territory. The gold output of the Fairbanks district averaged annually, from 1906 to 1908, \$9,000,000. It has lately fallen off through the exhaustion of bonanza placers, but lode mining is steadily increasing in production. Among the railway lines to be built by the United States, under the Act of Congress of April, 1914, the principal section is one from Chitina to Fairbanks, 313 miles, at a cost of \$14,000,000. The route recommended is via the Copper River valley and Delta Pass, although an alternate route was considered from Seward via the valleys of the Susitna and the Nenana rivers.

FAIRBANKS, ARTHUR (1864-). An American teacher and author. He was born at Hanover, N. H. After graduating at Dartmouth College in 1886, he studied at Union Theological Seminary and the Yale Divinity School, and received the degree of Ph.D. from Freiburg in 1890. He taught at Dartmouth, Yale, and Cornell, was professor of Greek literature and archæology in the University of Iowa from 1900 to 1906, and then for a year held the chair of Greek and Greek archæology at the University of Michigan. In 1907 he was elected director of the Boston Museum of Fine Arts. Among his writings are: *Introduction to Sociology* (1896; 3d ed., 1901); *First Philosophers of Greece* (1898); *A Study of the Greek Pæan* (1900); *The Mythology of Greece and Rome* (1907); *Handbook of Greek Religion* (1910).

FAIRBANKS, CHARLES WARREN (1852-1918). An American lawyer and public official, born near Unionville Centre, Ohio, a descendant of one of the first settlers of Dedham, Mass. He graduated at Ohio Wesleyan University in 1872, was admitted to the Ohio bar in 1874, managed W. Q. Gresham's campaign for the Republican presidential nomination in 1888, and in 1892 and 1898 was chairman of the Republican State Convention. In 1897 he was elected to the United States Senate from Indiana, and in 1898 he was appointed a member of the British-American Joint High Commission for adjusting Canadian questions, serving as chairman of the commissioners for the United States. In 1903 he was reelected to the United States Senate, and in 1904 he was elected vice president of the United States.

FAIRBANKS, DOUGLAS (1883-). American actor and motion picture star, born at Denver, Colorado, May 23, 1883. He was educated at Jarvis Military Academy, East Denver High School, and School of Mines. He was married in 1907, but divorced in 1918. In 1920 he married Mary Pickford, motion picture favorite. He made his first appearance in New York in 1901. He starred in *Hawthorne of the U. S. A.*, *Frenzied Finance*, *The Mark of Zorro*, *The Three Musketeers*, etc. He has starred in motion pictures for several years and has been the head of his own producing company since 1916.

FAIRBANKS, HENRY (1830-). An American clergyman and inventor, born at St. Johnsbury, Caledonia Co., Vt., the only son of Thaddeus Fairbanks. He graduated at Dartmouth College in 1853 and studied at Andover Theological Seminary. After his ordination in 1858 he entered the service of the Vermont Missionary Society. He was professor of natural philosophy at Dartmouth College in 1859-65 and of natural history in 1865-68. In 1869 he patented a scale for weighing grain and subsequently perfected and patented 34 additional inventions of various kinds.

FAIRBANKS, THADDEUS (1796-1886). An American manufacturer and inventor, born at Brimfield, Mass. In 1824 he entered into partnership with his brother Erastus, under the style of Erastus and Thaddeus Fairbanks, in the manufacture of stoves and plows, the patterns for which were planned and made by Thaddeus. He patented a cast-iron plow in 1826 and in 1831 a hemp dresser. Realizing the difficulty of weighing the rough hemp, the only scale then in use being the even balance and the Roman steelyard where the short arm carried

the loaded wagon either on a large platform or by chains attached to the axle, he constructed a platform scale on which an entire load could be weighed at one time. Thenceforth the brothers devoted themselves exclusively to the manufacture of scales in great variety, from the most delicate instruments for the use of chemists and jewelers to those for railroad tracks and canal weighlocks. He founded and liberally supported St. Johnsbury Academy.

FAIRBURY. A city in Livingston Co., Ill., 60 miles east of Peoria, on the Toledo, Peoria, and Western and the Wabash railroads (Map: Illinois, H 4). It is in a rich farming country, producing large quantities of corn; coal is mined, and there are grain elevators, flour and sorghum mills, machine shops, and cement works. The city contains a public library and owns its water works. Pop., 1900, 2187; 1910, 2505.

FAIRBURY. A city and the county seat of Jefferson Co., Neb., 57 miles southwest of Lincoln, on the Chicago, Rock Island, and Pacific, the Burlington, and the St. Joseph and Grand Island railroads, and on the Little Blue River (Map: Nebraska, H 4). It is a division point on the Chicago, Rock Island, and Pacific, and has manufactures and extensive nurseries. The city contains a Carnegie library and fine post-office building. It owns its water works and electric-light plant. Pop., 1900, 3140; 1910, 5294.

FAIRCHILD, CHARLES STEBBINS (1842-1924). An American lawyer and financier, born at Cazenovia, N. Y. Graduating from Harvard (A.B. 1863; LL.B., 1865), he was admitted to the bar in 1866. Thereafter he was Deputy Attorney-General of New York (1874), Attorney-General from 1876 to 1878, from 1885 to 1887 Assistant Secretary of the Treasury, and from 1887 to 1889 Secretary of the Treasury in Cleveland's first cabinet, succeeding Daniel Manning. He was a member of the Monetary Commission appointed by the Indianapolis Monetary Conference in 1897. From 1879 to 1905 he was president of the New York Security and Trust Company, and later he held high offices in other corporations.

FAIRCHILD, DAVID GRANDISON (1869-). An American botanist, born at East Lansing, Mich. He graduated from Kansas State Agricultural College in 1888, and also studied at the Naples (Italy) Zoological Station, at several foreign universities, and at the Buitenzorg (Java) Botanical Gardens. He became botanist of the United States Department of Agriculture in 1889. In 1897 he organized what is now the office of Seed and Plant Introduction and Distribution of the Department of Agriculture and in 1906 he took full charge of this work. Having assisted (1898-1903) Barbour Lathrop in four foreign agricultural explorations conducted in search of new economic plants, he afterward was placed at the head of these researches. His publications include bulletins of the United States Department of Agriculture on plant diseases, microscopic fungi, and marine algae, and also papers in various botanical proceedings and journals.

FAIRCHILD, GEORGE THOMPSON (1838-1901). An American educator. He was born at Brownhelm, Lorain Co., Ohio, and graduated in 1862 at Oberlin College (Ohio) and in 1865 at Oberlin Theological Seminary. He was instructor and later (1865-79) professor of English literature in the Michigan Agricultural Col-

lege and from 1879 to 1897 president of the Kansas Agricultural College. In 1898 he became vice president and professor of English literature in Berea College (Kentucky), where he remained until his death. He was ordained in 1871 to the ministry of the Congregational church. In 1897 he was elected president of the American Association of Agricultural Colleges and in 1900 published *Rural Wealth and Welfare*.

FAIRCHILD, HERMAN LEROY (1850-). An American geologist, born at Montrose, Pa. Graduating from Cornell University in 1874, he taught for one year at Kingston, Pa., was lecturer in New York City schools (1876-88) and professor of geology at Cooper Union (1878-88), and then went to the University of Rochester to be professor of geology and natural history, and, after 1896, of geology alone. He was general secretary (1894) and a vice president (1898) of the American Association for the Advancement of Science, and secretary (1885-88) and president (1912) of the Geological Society of America, and in 1911 president of the Commission Government Association of New York State. Besides preparing a *History of the New York Academy of Science* (1887) and editing Le Conte's *Elements of Geology* (1903), he is author of more than 100 monographs and articles on biological and geological subjects, especially on the glacial geology of New York State—a field of research in which he made valuable contributions.

FAIRCHILD, JAMES HARRIS (1817-1902). An American clergyman and educator, born at Stockbridge, Mass. He graduated at Oberlin College in 1838, was appointed a tutor there in the same year, and was ordained to the ministry in 1841. He was professor of languages at Oberlin in 1842-47, professor of mathematics in 1847-58, and professor of moral philosophy and theology in 1858-66. From 1866 until his resignation in 1889 he was president of the college. He became professor of theology in the Oberlin Theological Seminary in 1898 and later professor emeritus. His publications include *Moral Philosophy* (1869; rev. ed., 1892), as *Moral Science: or the Philosophy of Obligation*, and *Oberlin: The Colony and the College* (1883).

FAIRCHILD, LUCIUS (1831-96). An American soldier. He was born at Franklin Mills, now Kent, Ohio; removed to Madison, Wis., in 1846; spent six years (1849-55) in California; then returned to Madison, studied law, and was admitted to the bar in 1860. At the outbreak of the Civil War he was made captain of the First Wisconsin Regiment and subsequently became its colonel and a captain in the regular army, resigning both commissions in 1863. At Bull Run he commanded the famous Iron Brigade, and at Gettysburg was severely wounded while leading a charge at Seminary Ridge. In 1863 he was commissioned brigadier general of volunteers, but resigned in the same year. Afterward he served for three terms as Governor of Wisconsin, was appointed Consul at Liverpool in 1872 and Consul General at Paris in 1878, and was Minister to Spain from 1880 to 1882. In 1886 he was elected commander in chief of the Grand Army of the Republic.

FAIRCLOUGH, HENRY RUSHTON (1862-). An American classical scholar. Born near Barrie, Ontario, Canada, he graduated in 1883 from the University of Toronto, but came to the United States and, after further study

at Johns Hopkins, was associate professor and professor of classical literature at Leland Stanford Junior University (1893-1902) and professor of Latin after 1902. He was also professor of Latin in the summer schools of the University of Wisconsin (1906), Columbia (1908), and Chicago (1910), and was professor in the American School of Classical Studies, Rome, in 1910-11. In 1907-08 he was president of the Pacific coast branch of the American Philological Association. He served as editor in chief of the *Students' Series of Latin Classics* and is author of *The Attitude of the Greek Tragedians toward Nature* (1897); *The Andria of Terence* (1901); *The Connection between Music and Poetry in Early Greek Literature* (1902); *The Antigone of Sophocles* (1903); *The Trinummus of Plautus* (1909).

FAIRFAX, DONALD MCNEILL (1822-94). An American naval officer, a member of the famous Fairfax family of Virginia. He became a midshipman in the United States navy in 1837 and served under Dupont on the Pacific coast during the Mexican War. He was promoted lieutenant in 1851 and commander in 1862. He commanded the *Cayuga*, of the Gulf squadron, under Farragut, in 1862, and in 1863 was transferred to the South Atlantic squadron, in which he successively commanded the *Nantucket* and the *Montauk* in the attacks of Dupont and Dahlgren on Charleston. In 1864-65 he was placed in command of the Naval Academy. He attained the rank of captain in 1866, of commodore in 1873, and of rear admiral in 1880, retiring in 1885.

FAIRFAX, EDWARD (?-1635). An English author, best known as the translator of the *Gerusalemme Liberata* of Tasso. He was born at Leeds, Yorkshire, and lived as a scholar and writer, chiefly at Fuiston, in the same county. He wrote 12 eclogues, of which two have been published, and also, it is said, a *History of Edicard, the Black Prince*, never printed. His rendering of Tasso appeared in 1600, as *Godfrey of Bulloigne; or the Recoverie of Jerusalem*, and was dedicated to the Queen. Charles I found solace in perusing it during his last days in prison. The translation is in pentameter verse and continues to be the best English version. It was edited, in 2 vols., by S. W. Singer in 1817.

FAIRFAX, THOMAS, third LORD FAIRFAX (1612-71). An English Parliamentary general, better known as Sir Thomas Fairfax. The son of Sir Ferdinando (afterward second Lord) Fairfax, he was born at Denton, Yorkshire, Jan. 17, 1612. After receiving his education at St. John's College, Cambridge, he served as a volunteer in Holland under Lord Vere of Tilbury, whose daughter Anne he married shortly after his return to England. Although he was knighted in 1640 by Charles I, he declared for the Parliamentary cause and was appointed cavalry general under his father, who commanded the northern Parliamentary forces. He distinguished himself at Marston Moor, July 2, 1644. On the resignation of the Earl of Essex he was appointed commander general of the Parliamentary forces, with Cromwell as lieutenant general. On June 14, 1645, Fairfax, seconded by Cromwell and Ireton, gained a great victory at Naseby. Fairfax was chosen head of the commission which was appointed to try the King, but on discovering that that body was resolved on the execution of the King he refused to serve.

He refused, too, to march against the Scots, who had proclaimed Charles II King, and Cromwell succeeded him as commander in chief. Fairfax retired into private life with a pension of £5000 and devoted his leisure to literary pursuits. After Cromwell's death he represented Yorkshire in Richard Cromwell's first Parliament. He was leader of the delegates appointed to confer with Charles II at The Hague. He spent his last years in retirement at Bilburgh, near York, where he died, Feb. 12, 1671. *Short Memorials of Thomas, Lord Fairfax* (1699), a record of the Civil War, is the most important of his writings, which included theological, poetical, and other compositions. Consult *The Fairfax Correspondence* (4 vols., London, 1848-49), and Markham, *The Great Lord Fairfax* (ib., 1870).

FAIRFAX, THOMAS, sixth BARON FAIRFAX (1602-1782). An American Colonial pioneer, the best known of the Virginia Fairfaxes. He was born in Yorkshire, England. His father, Thomas, by marriage with the daughter of Lord Culpeper, had acquired immense estates in Virginia, comprising about 6,000,000 acres (21 counties), lying mostly between the Potomac and the Rappahannock, and forming almost one-quarter of the entire Colony of Virginia. Thomas, the son, after graduating at Oxford, visited his American estates in 1739, and in 1746, probably after a disappointment in love, left England and settled permanently in Virginia. Thither his younger brother, Sir William, had preceded him a few years earlier, and the latter's daughter Anne had become the wife of Lawrence, the elder brother of George Washington. This connection of the Fairfax and Washington families led to the friendship of Lord Fairfax and George Washington throughout the Revolution. Lord Fairfax employed the young Washington in important surveying work of his own and endeavored to further his interests with the provincial government. Though an ardent Loyalist during the Revolution, he was allowed to dwell in peace in his manor house near Winchester.

FAIRFIELD. A town and port of entry in Fairfield Co., Conn., 4 miles from Bridgeport and 51 miles northeast of New York City, on the New York, New Haven, and Hartford Railroad, and on Long Island Sound (Map: Connecticut, C 5). A popular summer resort, it has a beautiful situation and one of the finest beaches on the Sound. There are two libraries, the Pequot and the Memorial. The town manufactures rubber goods, aluminum ware, dog biscuit, wire goods, ladies' underwear, and paper. The foreign trade is small. Pop., 1900, 4489; 1910, 6134; 1920, 11,475. Fairfield was settled and incorporated in 1639. Its town hall, originally built in 1720, contains records dating back to 1648. Near Fairfield, in 1637, the Pequot Indians were almost exterminated. On July 6, 1779, Governor Tryon, at the head of a force of Hessians and Tories, entered the town after a sharp skirmish and on the following day almost completely destroyed it by fire. Consult Child, *An Old New England Town* (New York, 1895), and Osgood, *Centennial Commemoration of the Burning of Fairfield* (ib., 1879).

FAIRFIELD. A city and the county seat of Wayne Co., Ill., 117 miles east by south of St. Louis, Mo., on the Southern and the Baltimore and Ohio Southwestern railroads (Map: Illinois, D 5). The city is the centre of a fruit-growing

belt, especially noted for apples, and has a trade in grain, live stock, tobacco, etc., and manufactures of underwear, flour, and lumber. The light plant is owned by the city. Pop., 1900, 2338; 1910, 2479.

FAIRFIELD. A city and the county seat of Jefferson Co., Iowa, 100 miles (direct) east-southeast of Des Moines, on the Chicago, Burlington, and Quincy, and the Chicago, Rock Island, and Pacific railroads (Map: Iowa, F 3). Parsons College (Presbyterian), opened in 1875, is situated here, and there are a fine courthouse, county jail, hospital, county home, and a public library. The leading manufactures include agricultural implements, wagons, pumps, washing machines, gloves and mittens, malleable iron, brooms, and tile. Settled in 1839, Fairfield was incorporated in 1847. It is governed, under a charter of 1857, by a mayor, elected every two years, and a unicameral city council. The city owns and operates its water works and electric-light plant. Pop., 1900, 4689; 1910, 4970.

FAIRFIELD. A town in Somerset Co., Me., 21 miles north-northeast of Augusta, on the Maine Central Railroad (Map: Maine, C 4). It contains the Central Maine Sanitarium and a public park. There are lumber, pulp, and crate mills, worsted mills, and manufactories of screens, furniture, swings, and pie plates. Pop., 1900, 3873; 1910, 4435.

FAIR GOD, THE. A story of the conquest of Mexico, by Lew Wallace (1873).

FAIRHAVEN. A town in Bristol Co., Mass., on the Acushnet River, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, F 6). It lies opposite New Bedford, with which it is connected by two bridges as well as by ferry and electric railroad. It has a good harbor. The town is a summer resort and contains the Academy of the Sacred Heart, the Millicent Library, and a fine town hall and high-school buildings. There are fishing and shipbuilding interests and manufactures of tacks, nails, iron castings, loom cranks, whaleboats, and oil casks. The government is administered by town meetings. Fairhaven was separated from New Bedford and incorporated as a town in 1812. On Sept. 7, 1778, the militia, commanded by Major Israel Fearing, repulsed a British attack here. Pop., 1900, 3567; 1910, 5122. Consult Ricketson, *The History of New Bedford* (New Bedford, 1858).

FAIR HAVEN. A town in Rutland Co., Vt., 30 miles east of Rutland, on the Delaware and Hudson Railroad (Map: Vermont, A 6). It contains a Carnegie library and manufactories of various slate products. Fair Haven was chartered in 1783 and originally included the present town of West Haven. The water works and sewerage system are owned by the municipality. Pop., 1900, 2999; 1910, 3095.

FAIR HAVENS (Gk. *Kaloi Limenes, Kaloi Limenes*). An anchorage on the south coast of Crete, about 5 miles east of Cape Matala (also called Cape Lithinos or Litino), mentioned in Acts xxvii. 8, in the narrative of Paul's voyage to Rome. After being forced by strong north-west winds to round Cape Salmone (at the eastern extremity of Crete) and run under the lee of the south coast of the island, the ship arrived at Fair Havens. Here a stop of some duration was made, after which, though contrary to Paul's advice and warning, the captain made the attempt to round the cape and reach Phoenix, a more suitable winter harbor some distance to the

west. The favoring south wind soon changed to the northeast hurricane Euraquilo, which drove the ship far out into the Mediterranean and finally landed it a wreck on the coast of Malta. Fair Havens is not known to be mentioned in any ancient writing but Acts. The name survives in the locality to this day, however, in its modern Greek form. There was probably no town at the place, but Lasea was near by. The anchorage is small and well protected from westerly winds.

FAIRHEAD, or **BENMORE HEAD**. A striking promontory of columnar basaltic rock, 636 feet high, on the north coast of Antrim County, Ulster, Ireland (Map: Ireland, E 1).

FAIR HELEN OF KIRKCONNELL. A ballad of unknown origin. Helen shields her lover from the shot of a rival by throwing herself in front of him, and is killed, while the murderer is slain by the rescued lover. The same story appears in Wordsworth's *Ellen Irwin*.

FAIRHOLT, **FREDERICK WILLIAM** (1814-66). An English antiquary and illustrator. He was born in London, of German descent; was at first a drawing master, then a scene painter, and finally assistant to the wood engraver Sly. He was employed for several years by the Antiquarian Society and the British Archaeological Association of London to make drawings for their publications and edited several works on civic pageantry and other subjects for the Percy Society (1842). All his work as an illustrator is valuable from an archaeological standpoint, especially *Costume in England* (1860), the text of which he wrote himself. Other works which he wrote and illustrated are: *Tobacco: Its History and Associations* (1859); *Dictionary of Terms Used in Art* (1854); *Up the Nile* (1862). He supplied the designs for Charles Knight's *Shakespeare*, and other publications, Halliwell's *Life of Shakespeare* (1848), Hall's *Mansions of England* (1843-45), and many other works. His collection of Shakespeareana was left to the town of Stratford, the drawings and notes gathered for his *History of Costume* to the British Museum, and his works on civic pageantry to the Society of Antiquaries, of which he was a member.

FAIR ISLE. An isolated island, lying about halfway between the Orkney and Shetland islands, about 30 miles from either group and 24 miles southwest of Sumburgh Head (Map: Scotland, F 1). Area, 6 square miles. Its coast is practically inaccessible, except at North Haven, on the east coast. The population numbers about 200 inhabitants, who are engaged in sheep raising and fishing; the word "fair" is a derivative of the Norse *faar*, meaning a sheep. The flagship of the Duke of Medina Sidonia, the Admiral of the Spanish Armada, was wrecked at Stromceiler Creek in 1588, and 200 Spaniards escaped to the island. These survivors are believed to have taught the natives the art of knitting, which survives and is exemplified to-day in the making of colored hose in Moorish patterns. There are lighthouses and fog signals on the southwest and northeast extremities of the island.

FAIRLIE, *fär'li*, **JOHN ARCHIBALD** (1872-). An American economist. He was born in Glasgow, Scotland, but early removed to this country. He graduated from Harvard University in 1895, studied at Columbia, served for one year as secretary of the commission on canals of New York, was assistant professor and

junior professor at the University of Michigan (1900-09), and associate professor of political science (1909-11) and professor (thereafter) at the University of Illinois. He was a member of the Michigan Constitutional Convention in 1907-08 and also served as special agent of the United States Bureau of Corporations in 1908 and 1909. He became associate editor of the *National Municipal Review*. Besides articles in technical journals, he is author of *Municipal Administration* (1901); *National Administration of the United States* (1905); *Local Government in Counties, Towns, and Villages* (1906); *Essays in Municipal Administration* (1908); *Taxation and Revenue System of Illinois* (1910); *Commission Government in Illinois Cities* (1911); *The President's Cabinet* (1913); *Town and County Government in Illinois* (1913).

FAIR MAID. A fish; a local name in Virginia for the scup (q.v.).

FAIR MAID OF KENT, **THE**. Joan, daughter of Edmund Plantagenet, Earl of Kent. Her third husband was Edward, the Black Prince, her second cousin, by whom she became the mother of Richard II.

FAIR MAID OF NORWAY. Margaret, daughter of Eric II of Norway, and of Margaret, daughter of Alexander III of Scotland. Although a woman and of foreign birth, she was recognized as Alexander's successor, but died in 1290, while on her way to Scotland.

FAIR MAID OF PERTH, **THE**. A novel by Sir Walter Scott (1828). The name is applied to the heroine of the story, Catharine Glover.

FAIR MAID OF THE EXCHANGE, **THE**. A drama by Thomas Heywood (1607).

FAIRMONT. A city, summer resort, and the county seat of Martin Co., Minn., 68 miles south-southwest of Mankato, on the Chicago, Milwaukee, and St. Paul and the Chicago and Northwestern railroads (Map: Minnesota, O 7). It has a Carnegie library. Its industries include flour mills, gasoline-engine plant, brick and tile works, a cigar factory, and packing and produce houses. First settled in 1855, it is governed, under a charter of 1904, by a mayor, chosen biennially, and a unicameral council. It owns and operates its water works and electric-light plant. Pop., 1900, 3040; 1910, 2958.

FAIRMONT. A city and the county seat of Marion Co., W. Va., 77 miles southwest of Wheeling, at the head of navigation and on both sides of the Monongahela River, and on the New York Central, the Monongahela Valley, and the Baltimore and Ohio railroads (Map: West Virginia, D 2). The opposite sections of the city are connected by a steel bridge. Fairmont has a State normal school, the Cook Hospital and Training School for nurses, fine high-school and courthouse buildings, and a miners' hospital (State). It is an important coal-mining centre and carries on a large trade in glass products. Its manufactures include flouring mills, planing mills, foundries and machine shops, glass works, cigar factories, etc. Fairmont adopted the commission form of government in 1914. The water works are owned by the municipality. Pop., 1900, 5655; 1910, 9711; 1914 (U. S. est.), 11,439; 1920, 17,851.

FAIRMOUNT. A town in Grant Co., Ind., 59 miles north-northeast of Indianapolis, on the Cleveland, Cincinnati, Chicago, and St. Louis, and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads (Map: Indiana, F 4),

It is the seat of Fairmount Academy and the Wesleyan Theological Institute. It has agricultural interests and manufactures of glass bottles, drapery, catchup, and Chili sauce. The town owns and operates its water works. Pop., 1900, 3205; 1910, 2508.

FAIRMOUNT COLLEGE. An institution of learning, situated at Wichita, Kans. The college was first organized in 1892 as a coeducational preparatory school, with the assistance of the Boston Education Society. In 1895 a collegiate department was added, and in 1896 the name of the institution was changed to Fairmount College. It offers courses leading to the B.A. and the corresponding M.A. degrees. The abolishment of the preparatory school was begun in 1912-13, dropping one year at a time. The college will have, after 1915-16, a sub-Freshman department. In 1914 the college had an attendance of 325, of whom 168 were in the college proper. In connection with the college there is a conservatory of music. The library numbers about 28,000 volumes, besides pamphlets. The dean is Arthur J. Hoare.

FAIRMOUNT PARK. See PHILADELPHIA.

FAIR OAKS, BATTLE OF. See SEVEN PINES, BATTLE OF.

FAIR PENITENT, THE. A tragedy by Nicholas Rowe (1703).

FAIRPORT. A village in Monroe Co., N. Y., 10 miles east of Rochester, on the New York Central and Hudson River and the West Shore railroads (Map: New York, C 4). It is in a fruit-growing and farming district. The manufacture of cans is its chief industry. Pop., 1900, 2489; 1910, 3112.

FAIR ROSAMOND, röz'ä-münd. The name commonly applied to a daughter of Lord Clifford. She was the acknowledged mistress of Henry II and was said to have been kept by him in a bower at Woodstock, accessible only by a labyrinthine approach, which the King followed by means of a silk thread. According to the popular account, she was discovered and poisoned by Queen Eleanor (about 1173).

FAIR SIDA, THE. A play by Jakob Ayer, which Tieck considered to be the source from which Shakespeare drew *The Tempest*.

FAIRVILLE. A village in St. John Co., New Brunswick, Canada, situated on the Canadian Pacific Railway (Map: New Brunswick, C 3). It is connected by electric railway with St. John. It contains a hospital for nervous diseases, and its manufacturing industries include saw and pulp mills, box factories, brick-yards, a brush and woodenware factory, and a brewery. Pop., 1914 (municipal est.), 3500.

FAIRY. An imaginary creature of small size, conceived according to popular superstition as dwelling in a region called Fairyland and as having a special interest in the affairs of man. The term "fairy," however, is also loosely used to include other beings of a similar character, like the brownie, banshee, elf, fay, gnome, goblin, kobold, nixie, nymph, pixy, puck, salamander, sprite, sylph, troll, and undine. The *jinn*, *djinn*, or *jinnies* are of Oriental origin, the last of which in the corrupt form *genie* is especially associated with the *Arabian Nights*. The character of fairies as portrayed in literature may best be understood by mentioning such typical examples as Shakespeare's *Midsummer Night's Dream*, Spenser's *Faerie Queene*, Milton's earlier poems, Grimm's *Märchen*, and the fairy lore of the Irish tales. Towards mankind

fairies are commonly regarded as being beneficent in the main, though sensitive, whimsical, capricious, and often prankish; so that they need to be placated and spoken well of, as in Ireland, where they are termed "the good people." But bad fairies also exist, and their influence upon children plays a prominent part in the stories devoted to fairy lore. The imagination of the folk not only conceives of fairyland as a distinct domain, but it peoples hills, valleys, rocks, streams, and trees with fairy inhabitants, or sees fairy footprints, fairy rings, fairy tables, or fairy horses in natural objects and in natural phenomena.

Belief in fairies forms a phase of early folk thought, and it has partly a realistic basis, as in ancient India, e.g., where popular superstition transformed a lower race of inhabitants like the Nagas into serpent men and serpent women dwelling in enchanted regions beneath the earth. Fairy lore contains likewise certain elements of ancestor worship, of mythology, and of older religious beliefs which advancing knowledge looked upon as antiquated and relegated to the domain of the supernatural. The tendency of the folk to perpetuate the lore of the unseen world is very strong, and it is interesting to notice the changes in its attitude as culture progresses. A study of fairy stories is especially instructive in this regard. Extensive collections of these tales among many different peoples have been made through the influence of folklorists, and scholars have secured valuable results in this interesting field of research.

It is worth adding that the etymology of the word *fairy* has been a subject of some discussion. The suggestion to connect it with the Persian word *peri* is even older than Sir Walter Scott's *Essay on the Fairy Superstition*; but the Old French *faerie*, *faerie*, like our word *fay*, which is from OF. *fao*, Fr. *fee*, Ital. *fata*, Prov. *fada*, Span. *hada*, Lat. *fatate*, enchant, Lat. *fatum*, fate, points to a Romance origin for this term. To associate the word with the English adjective *fair* (AS. *fager*) would be merely a popular etymology.

FAIRY QUEEN. See FAERIE QUEENE.

FAIRY RING (because the fairies were supposed to dance there). A spot or circle in a pasture or lawn which is either more bare than the rest of the field or more green and luxuriant.

Frequently a bare ring appears like a footpath, with green grass in the centre, the circle which the ring forms, or of which it might form a part, being some yards in diameter. It is now ascertained that fairy rings result from the centrifugal development of certain kinds of fungi, especially of *Agaricus oreades* (or *Marasmius oreades*), *Agaricus gambosus*, *Agaricus coccineus*, and *Agaricus personatus*. The common mushroom (*Agaricus campestris*) shows a tendency to grow in the same manner. Probably the spot where the agaric has already grown is unfitted for its continued nourishment, and the mycelium or spawn extends outward to new soil, the fungus unfitting the soil to which it extends for the immediate nourishment of grass, but enriching it afterward by its own decay. Fairy rings of large size sometimes occupy the same situation for many years. The circle is almost always imperfect, some accidental circumstance having arrested the growth of the mycelium on one side. For illustration, see Plate of Edible Fungi, under FUNGI, EDIBLE AND POISONOUS.

FAIRY SHRIMP. See BRANCHIOPODA.

FAITH (OF. *feid*, *foit*, *fei*, *foi*, *foi*, *Fr. foi*, *It. fede*, from Lat. *fides*, faith, from *fidere*, to trust; connected with Gk. *peithein*, *peithen*, to persuade, AS. *biddan*, Eng. *bid*). In Jewish and Christian theology, that mental act of man which places him in an acceptable relation to God. In the later Jewish thought, it is a confident clinging to the belief in the power and goodness of Jehovah, in spite of the seeming triumph of evil. It was this faith which the apocalyptic literature aimed to conserve. In the teaching of Jesus, faith is also a belief in the power and goodness of Jehovah. Paul, who frequently uses the word, means belief in the word of God. Since he thinks of the message of God as having come to his generation through Jesus, Christian faith comes to be the acceptance of God's message of a way of salvation through Christ. God gives harmony with Himself, and faith is the acceptance of God's gift; a principle which, he maintained, underlay the Jewish religion itself. The writer of Hebrews broadens faith to mean the vision of the realities of the unseen, spiritual world. In all these meanings, faith includes two elements. One is intellectual. To the Jew it was the belief in the existence and power of Jehovah, to which the Christian added a belief that Jesus was the Messiah sent by Jehovah. This is the kind of faith which underlies our belief in the facts of history, or of science, or of daily life. The other element is volitional, a loving trust in God often issuing in an emotional quality.

As the Christian doctrine became formulated the gathered content of it was called the Christian faith. The intellectual element was emphasized, and faith became the assent to the authoritative body of teaching in the Church. The schoolmen, especially Aquinas (q.v.), distinguished between implicit and explicit faith: the last is conscious of its object; the first was defined by Aquinas as the preparation of the mind to believe what the Scriptures contain. Less careful thought regarded it as the acceptance of the uncomprehended teaching of the Church. This laid the basis for a popular contrast between faith and reason. In fact, faith is based on reason.

The Roman Catholic church has emphasized faith as the acceptance of doctrine, but with an

element of love in it. Protestantism has emphasized the personal trust in God, but usually with the demand for the acceptance of certain doctrines, held to be divinely revealed. Consult Harnack, *History of Dogma* (Boston, 1894-99), and Inge, *Faith and its Psychology* (London, 1909).

FAITH, ACT OF. See AUTO DA FÉ.

FAITH, RULE OF. A term, originating in the Church of the second century, used to indicate the sum of Christian doctrine. 1. Many persons, denying either the possibility or the fact of a supernatural revelation, maintain that human reason alone, as possessed by all persons of sound mind, is both the source and ground of all religious knowledge and conviction of duty. 2. Others, either denying or depreciating the authority of any external revelation, affirm that every man, in connection with his reason, has an inward revelation to which pertains the supreme authority in the belief of truth and knowledge of duty. 3. The Roman Catholic church, insisting that truth supernaturally revealed is the rule of faith, teaches that the revelation actually given is partly written (as contained in the Holy Scriptures) and partly unwritten (as contained in the traditions dating from the earliest ages of the Church), and that, consequently, the rule of faith includes both Scripture and tradition. And as the people cannot surely and perfectly understand either of these, the only authorized interpreter of them both is the Church. 4. Protestants believe that all truth necessary for salvation is contained in the canonical Scriptures of the Old and New Testaments, and therefore teach that these (received after due inquiry as the word of God, and interpreted according to man's own judgment, enlightened through the use of all accessible helps, human and divine) constitute for him the rule of faith. Among those holding this general principle of Protestantism there are recognized diversities, according as emphasis is laid on the authority of the Bible, the Church, or the individual reason. See CREEDS AND CONFESSIONS; RATIONALISM; INFALLIBILITY; BIBLE.

FAITH CURE. A term applied to the practice of curing disease by an appeal to the hope, belief, or expectation of the patient, and without the use of drugs or other material means. Formerly it was confined to methods requiring the exercise of religious faith, such as the "prayer cure" and "divine healing," but has now come to be used in the broader sense, and includes the cures of Mental Science, and hypnotism; also a large part of the cures effected by patent medicines and nostrums, as well as many folk practices and home remedies. By some it is used to include also Christian Science, but the believers in the latter regard it as entirely distinct.

Faith cure, in some of its forms, is as old as human history. The Christian Church has always held that prayer should be offered for the sick, and many sacred relics and favored shrines have had marvelous powers of healing ascribed to them. The Grotto of Lourdes, in France, and the shrine of Ste. Anne de Beaupré, in Quebec, are well-known instances. In each of these places thousands of cures have been wrought, in accordance with the faith of the sufferers in the potency of the blessed waters. These cures seem to many to be the natural consequences of the doctrine taught by the story of the Pool of Bethesda, and various utterances of Jesus and

the Apostles are quoted in support of more or less definite teachings and practices of faith healing. About a quarter of a century ago one Dr. Cullis, of Boston, created a sensation by preaching the efficacy of prayer in the cure of bodily ills. More recently two men became prominent from their advocacy of the prayer cure. Rev. A. B. Simpson, of New York, taught that the healing of the body is included in the Atonement, and that, having accepted the Atonement, it is dishonoring God not to claim healing of the body. Simpson followed the apostolic practice and anointed with oil. John Alexander Dowie, of Zion City (see CHRISTIAN CATHOLIC CHURCH), maintained a large establishment on the plan of a hotel, which he called a Divine Healing Home. His method consisted in prayer and the laying on of hands. He reported many cures and accumulated a large sum of money from the voluntary contributions of those who had been healed. Another class of divine healers is the group who have been styled the "tramp healers," from their habit of traveling about the country. The most important person in this class was the unfortunate Schlatter (q.v.), the Denver healer, whose autobiography shows that he was the victim of an insane delusion. Most prominent among those forms of healing covered by the broader use of the term "faith cure" are Christian Science (an account of which will be found in the article on that subject) and Mental Science, of which Dr. P. P. Quimby, of Portland, Me., was the formulator. Mrs. Eddy was a patient of Dr. Quimby, and is believed by some to have derived her "science" from him. This, however, is denied by Christian Scientists. Since Dr. Quimby's death Mental Science has been espoused by a large number of intelligent people, until there are now many variants. There being no organization and no one to dictate what one shall believe or practice, each Mental Scientist is free to put his own individuality into the movement, formulating his own theory and adapting his practice to his own ideas. This has resulted in the development of a large number of leaders and types of mental healing. Their treatment consists in holding up to the patient ideal conditions of health and happiness, and so freeing his mind from the unhappy condition or unpleasant thoughts which are supposed to have caused the physical disease. Sometimes this is done by conversation and sometimes by silent influence. Both Christian Scientists and Mental Scientists give "absent treatments," but the former with the understanding that God heals, while the latter claim that they influence the patient's mind.

Dr. Quimby discovered his theory of Mental Science through experimenting with hypnotism. A boy whom he was in the habit of hypnotizing pretended to diagnose disease while in the hypnotic state, and also prescribed a remedy. Dr. Quimby quickly discovered that the boy always named the disease in accordance with the belief of the patient, and also that the remedy prescribed, although it might be a perfectly inert substance, effected a cure. From this he concluded that it was the faith of the patient that was responsible for the cure. He therefore abandoned hypnotism and proceeded to explain his theory to his patients. When he succeeded in making them understand the doctrine, the cure followed. He had many patients, and is said to have wrought many cures. It did not

occur to Dr. Quimby to try hypnotism on the patient, and it has remained for a group of men now living to show the great value of hypnotism in faith cures.

The hypnotist first puts his patient to sleep, in which condition he believes anything that is told him—just as in our ordinary dreams the most absurd situations are accepted without question. The faith of the hypnotized subject is perfect, for the reason that no doubts can possibly enter his mind. The method of treating disease is very simple. Having put the patient to sleep, the hypnotizer persistently assures him that he is getting well or is already well. The exact formula is governed by the character of the disease. In severe or chronic cases he is usually content to declare at the first sitting that there will be improvement, and at future sittings he makes stronger assertions until he finally declares that the trouble is entirely removed and will not return. Hypnotism is the most scientific and the safest form of faith cure. Many people object to it from ignorance of the nature of hypnotism. But when it is understood that it is not the influence of one mind over another, and that one cannot be hypnotized against his will, this form of faith cure will take its place as one of the regular methods of combating disease.

Besides these recognized forms, faith cure is an important element in cures wrought by patent medicines and nostrums, home remedies and folk practices. The advertisement, testimonial of friend, or family tradition arouses the faith of the sick man, and he comes to believe that he needs only to follow directions to be fully cured. The actual value of faith cure as a therapeutic method has been the subject of much discussion. It can no longer be denied that it has value. From divine healing to patent medicine and Father Kneipp's (see KNEIPP) water cure, all cure disease. Each appeals to a particular type of mind, but the results are practically the same in all—same diseases cured, same successes, same failures. Many faith curists claim that all diseases in all persons can be cured by their method; others hold that the principle is of limited application. Of them all, the hypnotists are the only ones that do not make sweeping claims.

In estimating these claims many things must be considered. It has never been proved that any disease which is incurable by ordinary methods has been cured by faith. Many claims are made, but it is impossible to prove them. The difficulties are well-nigh insurmountable. First is the matter of diagnosis. No physician can be sure of his diagnosis in all cases. A man is sick; death proves that he was suffering from cancer; recovery shows that it was a non-malignant tumor. In consumption the only infallible test is a microscopic examination. Next to diagnosis must be considered what is called *medicatrix natura*—the healing power of nature or the natural tendency to recovery. Scientific studies of this subject have shown that the lists of faith cures contain a large percentage of cases that would have recovered without any treatment. Thirdly, the cure must be proved as well as the disease. Many a recovery is announced which proves to be only a temporary renewal of strength. When later the patient relapses, this is either not mentioned or is attributed to another cause. In addition to these difficulties, and complicating them, is

the notorious untrustworthiness of human testimony—the tendency to exaggeration and the infrequency of impartial judgment.

The actual cures, however, are sufficiently numerous and sufficiently striking to need an explanation. These different forms agree in only one point—viz., the mental state of the patient is one of hope and expectation. Can states of mind cause or cure disease? Some familiar occurrences seem to justify an affirmative answer. It is well known that certain glands and secretions are markedly affected by emotions. Fear causes the saliva to cease to flow and the perspiration to start. Sorrow causes the lachrymal glands to secrete tears. Happiness favors digestion, unhappiness retards it. Mosso has demonstrated that the bladder is especially sensitive to emotional states. In general, pleasant and unpleasant emotions produce opposite physical effects. There are many glands within the body whose action under emotion we cannot observe; but we may reasonably assume that they also are affected by emotional states. Hence, if unpleasant emotions so act upon the glands as to derange the system and cause disease, the pleasant emotions may reasonably be assumed to tend to restore the normal functions. The various forms of faith cure tend strongly to put the patient in a happy frame of mind—a condition favorable to health. However, there are all degrees of faith and wide differences in the way the system responds to the emotional state. One person is slightly affected by a strong emotion; another is strongly affected by a weak emotion. Hence there must always be a wide difference in the results of faith-cure methods. The diseases most amenable to faith cure are nervous—including many not recognized as nervous, but having a neural condition as their basis—and functional derangements. The symptoms of organic diseases are frequently ameliorated. Chronic diseases due to neuromuscular habit often yield to hypnotic treatment. Consult: Pease, *Divine Power* (New York, 1905); Podmore, *Mesmerism and Christian Science* (London, 1909); Lawrence, *Primitive Psychotherapy and Quackery* (New York, 1910); Cutten, *Three Thousand Years of Mental Healing* (ib., 1911). See HYPNOTISM.

FAITHFUL. An allegorical character in Bunyan's *Pilgrim's Progress*.

FAITHFULL, EMILY (1835-95). An English philanthropist. She was born at Headley Rectory, Surrey, and was educated at Kensington. Becoming interested in the condition of working women, she founded in London a printing establishment, known as the Victoria Press (1860), in which women were employed as compositors. The undertaking met with great opposition, but the Queen showed her approval by appointing Miss Faithfull publisher in ordinary to her Majesty. In 1863 she started the *Victoria Magazine*, in which were set forth the claims of women to remunerative employment. In 1868 she published a novel, entitled *Change Upon Change*. She also appeared as a lecturer, visiting the United States in 1872-73 and 1882. She died May 31, 1895. Consult *Three Visits to America* (Edinburgh, 1884).

FAITHFUL SHEPHERDESS, THE. A pastoral drama by John Fletcher (c.1610). From it Milton drew for parts of his *Comus*.

FAITHORNE, WILLIAM (1610-91). An English line engraver and painter. He was born in London and studied principally under

Sir Robert Peake. During the Civil War he took the part of the monarchy and was banished to France, where he remained until 1650. While in Paris he studied under Robert Nanteuil. On his return to England in 1650 he practiced as an engraver, also selling prints. From about 1680 he devoted himself to portraiture in crayons. His engravings are chiefly portraits of eminent persons, after Lely, Van Dyck, and others. His execution is clear and finished and his crayon portraits are distinguished by brilliant color. Among the best known of his engravings are the portraits of Lord Paston; The Duchess of Cleveland (after Lely); Lady Paston (after Van Dyck); Charles I; Charles II; Prince Rupert; and Oliver Cromwell. He also engraved two curious maps, one of London (in the National Library, Paris), and one of Virginia and Maryland (in the British Museum). His works were catalogued by Louis Fagan (London, 1888). Faithorne wrote *The Art of Graving and Etching* (1662), dedicated to his master, Sir Robert Peake. Consult Fagan, *A Descriptive Catalogue of the Works of William Faithorne* (London, 1888).

FAIZABAD. See FYZABAD.

FAIZABAD, fī'zā-bād'. The capital of the Afghan Province of Badakhshan, on the Kokcha River, 180 miles northeast of Kabul (Map: Afghanistan, O 4). It has a fort, is a trade centre, and is celebrated for its ruby mines. Pop., about 2500.

FAJARDO, fā-hār'dō. A river port near the northeast coast of Porto Rico, near the mouth of the Fajardo River. Its growth has been rapid on account of its excellent harbor. It is situated in a sugar-manufacturing district and exports tortoise shell in considerable quantities, besides sugar and molasses. Pop., 1899, 3414; 1910, 6036.

FAKHR-AD-DIN AR-RAZI, fāk'r-ad-dēn' ār-rā'zē, also known as IBN AL KHATIN (1149-1209). A Mohammedan philosopher and theologian. He was born at Rai, Tabaristan, and first studied with his father and later at Merv and Maragha, where he was one of the pupils of Al Majd al Jili, who in turn had been a disciple of Al Ghazali. He was accused of rationalism, despite the fact that he restored many to the orthodox faith. His commentary on the Koran, entitled *Al-fatih-al-hab*, or 'Keys of the Unseen' (8 vols., Cairo, 1890), is the most varied of extant works of the kind, comprising most of the material of importance that had previously appeared. It has some mysticism, opposes anthropomorphism, and in general carries on the teachings of Al Ashari. Fakhr-ad-din devoted himself to a wide range of studies and expended a large fortune on experiments in alchemy. He taught at Rai and Ghazni, and became head of the university founded by Mohammed Ibn Tukush at Herat.

FAKIR, fā-kēr' (Ar. *faqir*, beggar, religious mendicant, from *faqira*, to be poor). In general, a religious mendicant; more specifically, a Hindu marvel worker or priestly juggler, usually peripatetic and indigent. The fakir may be regarded as a differentiated shaman or sorcerer, standing midway between the best and the worst products of the original class—i.e., between priest and beggar. There are, however, many classes, defined chiefly by cult, but also by race, school, or particular craft. In Mohammedan countries fakirs are usually divided into two classes—the orthodox, or those

"within the law," and the heterodox, or those "without the law." In portions of India, also, there is a particularly orthodox or elevated class, known as yogis, with a much larger irregular or outlaw class; and in some sections the fakirs grade into dervishes, some of whom engage in religious rites or invocations involving peculiar postures or movements, such as spinning on the toes with outstretched arms for hours at a time. The Hindu fakirs are probably the most expert jugglers in the world, and many of their feats have puzzled the most acute Western students—some have never been fully explained. They appear to be adepts in sleight of hand, in hypnotism, in ventriloquism, in producing illusions, and in controlling organic reactions by voluntary effort, and many of the current devices of jugglery in other parts of the world have been borrowed from them. The parallelism between the Hindu fakir and the Amerind shaman is particularly close, as in the mango trick of the one and the corn trick of the other. In both cases the plant is apparently grown in sight of the spectators, in a few minutes, from the seed, through the tender shoot, the forming bud, the full bloom, the immature fruit, and the ripened product, all by an ingenious series of illusions: but the Oriental trick has become little more than a feat of jugglery; the Occidental one remains a part of a solemn religious ceremony. See MAN, SCIENCE OF, section *Sophiology*.

FAKUMEN, fä'kū-mūn'. A town of southern Manchuria about 40 miles north of Mukden and 20 miles west of Tie Pass. It was occupied by the Japanese, March 18, 1905, after the battle of Mukden.

FALAISE, fä'läz'. The capital of an arrondissement in the Department of Calvados, France, on the Ante, 19 miles southeast of Caen (Map: France, E 4). It is built on a cliff, whence its name. The chief buildings are the two Gothic churches, La Trinité and Saint-Gervais, the hospital, and the ruined castle and fortress, once the seat of the dukes of Normandy, and the birthplace of William the Conqueror, a statue of whom stands on the Place Saint-Gervais. In the castle, the chamber in which the Conqueror was born is shown. Educational institutions include a college and a library. Falaise manufactures cottons, hosiery, bobbinet, dyestuffs, chimies, and leather. An annual fair, dating from the eleventh century, is held each August at Guibray, a suburb. Pop. (commune), 1901, 7657; 1911, 6847. Consult Dodd, *Falaise, the Town of the Conqueror* (Boston, 1900).

FALANAKA, fä'lä-nä'kä (Malagasy word). A peculiar fossorial civet (*Eupleres goudotii*) of Madagascar, remarkable for its slender skull, the weakness of its jaws, and the small size of the teeth, which are insectivore-like and, with other characteristics, make this animal the most aberrant of the Viverridae. Accordingly it is placed in a subfamily (Euplerinae) by itself.

FALASHAS, fä-lä'shāz (Ethiop., wanderers). The inhabitants of the Abyssinian Kingdom of Amhara. They claim to be of Jewish race and to be descended from emigrants of the period of disorder in Israel during and following the reign of Jeroboam. Whether they are true Jews, or descendants merely of proselytes of the period of close connection between Abyssinia and Israel, is uncertain. They practice debased Jewish rites, are not acquainted with

the Babylonian or Jerusalem Talmud, make no use of the *tephillin*, and observe neither the Feast of Purim nor that of the Dedication of the Temple. They possess, in Geez, an Ethiopic dialect of great antiquity, the foundation of the Amharic, the canonical and apocryphal books of the Old Testament; a volume of extracts from the Pentateuch, with comments, given as they think, from God to Moses on Mount Sinai; the Te-e-sa-sa Sanbat, or laws of the Sabbath; the Ardit, a book of secrets revealed to twelve saints, which is used as a charm against disease; lives of Abraham, Moses, etc., and a translation of Josephus, called Sana Aihud. A copy of the Orit, or Mosaic law, is kept in the holy of holies in every synagogue. Various pagan observances are mingled in their ritual; every newly built house is considered uninhabitable till the blood of a sheep or fowl has been spilt in it; a woman guilty of a breach of chastity has to undergo purification by leaping into a flaming fire; the Sabbath has been deified and, as the goddess Sanbat, receives adoration and sacrifice, and is said to have ten thousand times ten thousand angels to wait on her commands. There is a monastic system, said to have been introduced in the fourth century. The monks must prepare all their food with their own hands, and no lay person, male or female, may enter their houses. Celibacy is not practiced by the priests, but they are not allowed to marry a second time, and no one is admitted into the order who has eaten with a Christian or is the son or grandson of a man thus contaminated. Belief in the evil eye or shadow is universal, and spirit raisers, soothsayers, and rain doctors are in repute.

Education is in the hands of the monks and priests, and is given only to boys. Fasts, obligatory on all above seven years of age, are held on every Monday or Thursday, on every new moon, and at the Passover (the 21st or 22d of April). The annual festivals are the Passover, the Harvest Feast, the Baala Mazälat or Feast of the Tabernacles (during which, however, no booths are built), the Day of Covenant or Assembly, and Abraham's Day. It is believed that after death the soul remains in a place of darkness till the third day, when the first *taskar*, or sacrifice for the dead, is offered; prayers are read in the *mesgeed* (synagogue) for the repose of the departed, and for seven days a formal lament takes place every morning in his house. No coffins are used, and a stone vault is built over the corpse so that it may not come into direct contact with the earth. The Falashas are an industrious people, living for the most part in their own villages or, if they settle in a Christian or Mohammedan town, occupying a separate quarter. They engage in agriculture, manufacture pottery, ironware, and cloth, and are especially sought after for their skill in masonwork. Their number is variously estimated at from 100,000 to 250,000. Consult: Flad, *The Falashas of Abyssinia* (Eng. trans., London, 1869); Stern, *Wanderings among the Falashas in Abyssinia* (London, 1862); Halévy, *Travels in Abyssinia* (Eng. trans., London, 1878). M. Halévy was a Jew, sent to Abyssinia to offset the effects of Christian missionary work. Consult also: Morais, "The Falashas," in *Pennsylvania Monthly* (Philadelphia, 1880); Cyrus Adler, "Bibliography of the Falashas," in *American Hebrew* (New York, 1894); Lewin, "Ein verlassener

Bruderstamm," in *Bloch's Wochenschrift* (February, 1902); J. Faitlovitch, *Notes d'un voyage chez les Falachas* (Paris, 1905).

FALB, fälp, RUDOLF (1838-1903). An Austrian meteorologist, born at Obdach, Styria. He studied theology at Gratz, and although ordained to the priesthood, subsequently became converted to Protestantism. From 1869 to 1872 he studied mathematics, physics, geology, and astronomy at Prague and Vienna, and from 1877 to 1880 he traveled through North and South America. Subsequently he became established at Berlin. He was widely known by his theory that the influence of the sun and moon, exercised conjointly on the atmosphere and on the molten material beneath the earth's surface, produces earthquakes and other disturbances of nature. This theory has, however, found no acceptance among scientists. He was popularly known for his predictions of "critical days." In 1868 he founded the popular astronomical periodical *Sirius* (conducted from 1882 by Klein). His works include: *Von den Umwälzungen im Weltall* (3d ed., 1890); *Das Wetter und der Mond* (2d ed., 1892); *Kalender der kritischen Tage* (1892 et seq.).

FALCK, fälk, NIELS NIKOLAUS (1784-1850). A German jurist, born at Emmerlef, Schleswig, and educated at Kiel. In 1814 he became professor of law at Kiel, and in 1838 was appointed President of the Schleswig-Holstein Assembly of the States, but lost the support of the Liberals by his vacillating policy. He published a *Juristische Encyklopadie* (5th ed., 1851) and was a prolific author in the history and jurisprudence of Schleswig-Holstein. His works include *Handbuch des schleswig-holsteinischen Privatrechts* (1825-48) and *Sammungen zur nähern Kunde des Vaterlandes* (1819-25). He also edited the *Staatsbürgerliches Magazin* (10 vols., 1821-31; continued as *Neues Staatsbürgerliches Magazin*, 10 vols., 1833-41).

FALCKENSTEIN, fälk'en-stin, EDUARD VOGEL VON. See VOGEL VON FALCKENSTEIN, EDUARD.

FALCON, fô'k'n (OF. *falcon*, *faloon*, It. *falcone*, from Lat. *falco*, falcon, from *fala*, sickle). Broadly, any hawk of the family Falconidae, more usually and scientifically one of those species which, in the language of falconry, were styled "noble" birds of prey. The true falcons are characterized by a bill curved from the base, the upper mandible hooked at the point, and the cutting edge of the upper mandible furnished with a prominent projection or "tooth." The claws are also sharp, curved, and strong; and in accordance with all this powerful armature the whole frame is very robust and muscular. The legs are rather short and have great power in striking or seizing prey. The breastbone and shoulder girdle are large and adapted for the attachment of powerful muscles; the wings are long and pointed. The true falcons are bolder in proportion to their size than any other of the Falconidae, even the eagles. Their acuteness of vision is wonderful, and they have very great powers of flight. A falcon is recorded as having traversed the distance between Fontainebleau and Malta, not less than 1350 miles, in 24 hours. They soar to a prodigious height in the air, always endeavoring to outsoar any bird of which they may be in pursuit and to swoop down upon it from above; although it is far more difficult for them to rise vertically in a calm atmosphere than for birds of short and rounded wing, and they either

rise obliquely—often making their onward flight in a series of arcs—or avail themselves of the wind, and by flying against it are borne aloft as a boy's kite is.

The species are numerous and widely distributed. Some of them are of very wide range, while others are peculiar to certain countries or climates. The best-known American species are the gyrfalcon (q.v.), formerly confused with the Iceland falcon and the Greenland falcon, and the peregrine falcon, known in the United States as duck hawk, of which the female is par excellence "the falcon of falconers" and the male is the "tercel," "tiercel," or "tercelet." The hobby (*Falco subbuteo*); the red-footed or red-legged falcon (*Falco rufipes* or *vespertinus*), a small species, much resembling the hobby; the merlin (*Falco æsalon* or *regulus*) and the kestrel or windhover (*Falco tinnunculus*) are common and well-known English species. The gyrfalcon and peregrine are European also. The name "falcon" is sometimes extended to cover all of the various birds included in the Falconidae, some 350 species, of which about one-tenth occur in the United States. The birds commonly called buzzards, eagles, kites, hawks, harriers, ospreys, and caracaras (qq.v.) are usually included in that family, but it is obviously confusing to call them all falcons, and the word is better restricted therefore to the genus *Falco*, in its present restricted sense.

For the use of falcons in sport, see FALCONRY; for books relating to the family, see BIRDS, and consult Fisher, *Hawks and Owls of the United States* (Washington, 1893); and for portraits, see Plates of EAGLES AND HAWKS, and FALCONS AND FALCONRY.

FALCON. A small mediæval gun. Falcons were generally long (20 to 30 calibres) and light. While some are said to have been of sufficient size to throw shot of six pounds' weight, the majority were much smaller. In the sixteenth century Henry II of France decreed that the falcon should fire a ball of one pound weight, and that the falconet should use one weighing one-half pound. See ARTILLERY.

FALCÓN, fál-kôn'. A maritime state of Venezuela, occupying the territory around Lake Maracaibo in the northwestern part of the Republic (Map: Venezuela, C 1). From 1881 to 1904 it was joined to Zulia, which is now a separate state. It is traversed by a chain of low mountains, and the soil in the valleys is very fruitful, though the coast regions are dry and barren. The chief products are coffee, cacao, corn, cotton, sugar cane, coconuts, fruits, and tobacco. Stock raising is of importance, and the state has some mineral wealth. Pop., 1891, 151,692; 1909, 139,110. Coro is the capital.

FALCÓN, fál-kôn', JUAN CRISTÓFOMO (1820-70). A Venezuelan soldier and politician, born on the Peninsula of Paraguaná (State of Falcón, then Province of Coro). After a brilliant military career he became, in 1858, the leader of the Federalist revolutionary movement in Coro, and in 1863 entered Carácas in triumph, after being elected President of Venezuela. He sanctioned the promulgation of a new constitution in 1864. Overthrown in a revolutionary riot three years later, he withdrew to Europe, whence, upon the success of a counter-revolution, he was summoned again to assume office. He died on the return voyage, at the island of Martinique.

FALCONE, fál-kó'ná, ANIELLE (ANGELO) (1600-65). An Italian battle painter, born in Naples. He was a pupil of Jusepe de Ribera (q.v.) and himself founded a large school. His work being mostly confined to battle pieces, he was called "L'oracolo delle battaglie." At the outbreak of the revolt of the Neapolitans under Masaniello against Spain, he organized his pupils into the "Compagnia della morte," which never spared a Spaniard. After the suppression of the revolt he was forced to flee to Rome. Proceeding to France, he was eminently successful there, numbering Louis XIV among his patrons. Under the protection of Colbert he returned to Naples, where he died in 1665. His paintings, of which not many survive, are full of life and animation, are brilliant in color, and careful in drawing. As he seldom signed them, they are sometimes confounded with those of his pupil Salvator Rosa, who also studied under Ribera. The Prado (Madrid) possesses two of his battle pieces, the Louvre one, and the Museum of Naples two. He was also an important etcher, in command of a bold and spirited technique.

FALCONER, fál'k'nēr, EDMUND (1814-79). The assumed name of Edmund O'Rourke, an English actor and playwright. He was born in Dublin, Ireland, first performed on the English provincial stage, and afterward went to London, becoming manager of the Lyceum Theatre (1858 and again in 1861) and of Drury Lane (1862-66). He wrote for other theatres and was in the United States for three years (1867-69), connected with the Olympic Theatre in New York. Returning to England, he died Sept. 20, 1879. He composed or adapted many plays. *The Cagot* was performed at the Lyceum, London, in 1856. The most popular of his dramas was *Peep o' Day* (1861), founded on one of Banim's stories of Irish life. As an actor he was admirable in Irish rôles.

FALCONER, HUGH (1808-65). A Scottish botanist and paleontologist, born at Forres (Elginshire). He graduated at the University of Aberdeen in 1826, studied medicine at the University of Edinburgh in 1826-29, went to India in 1830 as assistant surgeon in the service of the East India Company, and in 1832 became superintendent of the botanic garden at Saharanpur (Northwestern Provinces), India. His investigations led to the discovery in the Siválík Hills of large numbers of important vertebrate fossils. For his work in connection with these remains he obtained the Wollaston medal of the Geological Society of London in 1837. It was on his recommendation, in a report to the government of Bengal, that the culture of the tea plant was introduced into India. He also discovered the asafetida plant, and was the first to give a description of it. During his residence in England on sick leave in 1843-47 he prepared the India fossils of the British Museum for exhibition. In 1847 he received appointment as superintendent of the Calcutta Botanic Garden, and professor of botany in the medical college there. Because of ill health he returned to England in 1855 and spent the remainder of his life examining fossil species there and on the Continent. He was elected foreign secretary of the Geological Society and a vice president of the Royal Society. He edited a large incomplete work entitled *Fauna Antiqua Sivalensis* (1846-49; nine parts, with illustrations of 1123 specimens, and one volume of text) and published a *Descriptive Catalogue of the Fossil Re-*

mains from the Senalik Hills (1859). Considerable unpublished material was edited by C. Murchison as *Paleontological Memoirs and Notes of the Late Hugh Falconer* (London, 1868). Consult the biographical notice in the first volume of that work, and the *Royal Society's Catalogue of Scientific Papers*, vol. ii (London, 1868).

FALCONER, ROBERT ALEXANDER (1867-). A Canadian clergyman and educator. He was born at Charlottetown, Prince Edward Island, and was educated at Queen's Royal College, Trinidad, and at London and Edinburgh universities. Later he also studied at German universities. He was ordained a Presbyterian minister in 1892. In 1892-95 he was lecturer in, and in 1895-1904 professor of, New Testament exegesis in the Presbyterian College, Halifax; and in 1904-07 he was principal of the college. In 1907 he became president of Toronto University. In the same year he was appointed a member of the joint committee to promote church union between the Presbyterian, Methodist, and Congregational churches in Canada. He contributed numerous articles on theological and biblical subjects to encyclopedias and to British and American periodicals. He published *The Truth of the Apostolic Gospel* (1904), besides a number of educational lectures and addresses. In 1911 he was created C.M.G.

FALCONER, WILLIAM (1732-69). An English poet, son of a poor barber. He was born in Edinburgh. Becoming a servant, he found in Archibald Campbell a master who encouraged his literary tastes. He went early to sea, and before he was 18 years of age he was second mate on a vessel in the Levant trade, which was shipwrecked off Cape Colonna in Greece. Of the crew only he and two others were saved. The story of this voyage he related in a poem called "The Shipwreck" (1762). Entering the royal navy, he was appointed purser on the frigate *Aurora*, which was about to sail for India. The *Aurora*, after touching at the Cape of Good Hope, December, 1769, was lost. All the crew perished. "The Shipwreck" passed through three editions before this tragic event, and is still an interesting poem. Falconer wrote a political satire entitled *The Demagogue* (1764) and compiled a nautical dictionary, *The Universal Marine Dictionary* (1769). His *Poetical Works* were edited, with a *Life*, by Gilfillan (London, 1854).

FALCONET, fál'kó'ná', ETIENNE MAURICE (1716-91). A French sculptor. He was born in Paris and studied with Nicolas Guillaume and Lemoyne. His first important work—the vigorous "Milo of Crotona" (Louvre)—secured his admission to the Academy (1744), in which he became professor in 1761 and associate rector in 1783. In 1757 he was appointed director of sculpture at the Sevres factory. He was employed by the Marquis de Pompadour and also modeled a number of important statues for the church of Saint-Roch, including one of "Christ in Agony." In 1768 Catharine II of Russia summoned him to model a bronze equestrian statue of Peter the Great at St. Petersburg—his masterpiece. Although the statue required 12 years to model and cast, it possesses little originality and is remarkable chiefly for the exaggerated position of the horse. After his return to France in 1781 he devoted himself principally to writing. His literary works, mostly concerned with his own art, were published as *Ouvrages*

complètes d'Etienne Falconet (Lausanne, 1785). Falconet is one of the most important sculptors of the eighteenth century in France. He shows to best advantage in such graceful statues as "Winter," "Pygmalion" (one of his most delicate and personal works), "The Three Graces," "The Bather" (both in the Louvre), "Venus and Love" (Wallace Collection, London), and "Music." His modeling is correct and skillful, but his work is somewhat affected in sentiment.

FALCONETTO, fāl'kō-nēt'tō, GIOVANNI MARIA (1458-1534). A Veronese architect and painter of the Renaissance. He studied under his father, Jacopo Falconetto, and probably under Melozzo da Forlì, but was by preference an architect. His chief works in painting were frescoes in the chapel of San Biagio, church of San Nazaro (1493), the Duomo (1503), and the church of San Pietro Martire in Verona—the latter a series of religious allegories somewhat in the manner of his master. His easel pictures, such as "Augustus and the Sibyl," in the Verona Gallery, are weak and exaggerated. More important are his architectural works at

Bishop of Lacedonia in 1892 and raised to the archbishopric of Acerenza and Matera in 1895. He served as apostolic delegate to Canada from 1899 to 1902 and to the United States from 1902 to 1911, when he was elevated to the cardinalate. A volume of his *Pastoral Letters* was translated into French in 1900.

FALCONRY, fō'k'n-rī. The art of training falcons born in a state of freedom so that when they have flown and captured their quarry they will, instead of devouring it, give it up to their trainer. They will pursue and capture on the wing the heron, partridge, lark, rook, magpie, wild duck, pigeon, and rabbit, and in India game as large as the deer. In ancient times this sport was called hawking, a term still preserved in many places. Nowadays falconry is the term applied to the sport and all that pertains to it: hawking, to its actual practice out in the field. Falconry as a sport is of very ancient origin. Apparently it was practiced in China as early as 2000 B.C., in Japan 600 B.C., and in Babylonia in 1700 B.C. In England, after the Norman Conquest, it was much indulged in by kings,

ANCIENT FALCONRY.
(From an old manuscript in the British Museum.)

Padua, where he designed and built the fine Renaissance Palazzo Giustiniani (1524) and other structures, including several of the city gates.

FALCONIFORMES, fāl'kon-i-fōr'mēz. An ordinal term, used by Evans and some recent ornithologists, for the raptorial birds, including (1) the Cathartidae and (2) the Accipitres, the latter embracing (a) the Falconinae and (b) the Pandioninae. It is usually replaced by the ordinal term Accipitriformes, while the American Ornithologists' Union still sanctions the old all-inclusive Raptores.

FALCONIO, fāl-kō'nyō, DIOMEDE, Cardinal (1842-1917). An American Roman Catholic prelate, born at Pescocostanzo, in the Abruzzi, Italy. Entering the Franciscan Order in 1860, he finished his novitiate in 1865, was sent as a missionary to the United States, where he became a naturalized citizen, and was ordained a priest in the following year. In 1866 he became professor and vice president of St. Bonaventure's College (Allegany, N. Y.) and two years later president of the college and seminary of St. Bonaventure. From 1872 to 1882 he was administrator of the cathedral at Harbor Grace, Newfoundland. Returning to Italy in 1883, he was twice elected provincial of the Franciscans and was also commissary, visitor general, synodical examiner, and procurator general of the order at various times. He was consecrated

nobles, and ladies; and in those days the rank of the individual could be indicated by the particular species of hawk carried on his wrist. Thus, royalty carried the gyrfalcon, an earl the peregrine, a yeoman the goshawk, a priest the sparrow hawk, and a servant the kestrel. In the seventeenth century the sport declined; in the eighteenth century it partially revived, but again fell off about the year 1727, when the art of shooting birds on the wing became the fashion. In the present day its restoration in England, Holland, and France is attended with growing success, though no country in the world has such a variety of hawks, or such opportunities for flying them, as the United States, in which country and Canada several successful clubs have been organized for the encouragement of the sport. In Spanish America hawking was long esteemed as a favorite sport. In the East, from China to Morocco, falconry still maintains its old-time position as a field sport.

In falconry two distinct kinds of hawks are used—the long-winged, or true falcons, and the short-winged. The first are represented chiefly by the gyrfalcon and peregrine; the second by the goshawk and sparrow hawk; and though for certain purposes the male is superior, as a rule the females of each species are much more highly esteemed for sporting purposes, from their being larger and more powerful. "Long-winged" hawks may also, as a rule, be distin-

guished from the "short-winged" by their having a "tooth" or notch on the upper mandible; from the second feather of the wing being either longer or as long as the third; from the color of the iris, which is of a brown hue, so dark as sometimes to appear black; and from their impetuous "stoop" when they descend from a height on their prey.

The gyrfalcon (q.v.) is the largest species, but the peregrine is in greatest favor with falconers, and if taken from the nest, as is usually the case, and carefully trained, affords great sport. No hawk is fit for sporting purposes until it has undergone a careful process of training. The young hawk taken from the nest of its wild parent is more easily trained than that which has been trapped in a wild state when at maturity; but in either case considerable practice is necessary before the falcon can be considered fully equipped for the sport. The following are some of the terms used in falconry: *Claws, pounces; wings, sails; lower stomach, pannel; feathers, hair, etc., ejected at the mouth, the castings.* A young hawk from the nest is an *eyess* or *eyas*; a mature wild hawk is a *haggard* or *blue hawk*; hawks in their first year are *red hawks*—the term *red* being applied merely as a title of distinction between the young hawk and the eyess or nestling, the colors of the two being in reality the same. Fluttering is *bateing*; fighting with each other, *crabbing*; sleeping, *jonking*. The prey is termed the *quarry*. When the hawk strikes her quarry in the air and clings to it she *binds*; when she flies off with it she *carries*. Dead game is the *pelt*. *Stooping* or *swooping* is the act of descending with closed wings from a height at the object of its prey. When game flies into a cover it *puts in*. When the hawk is molting her feathers she is *mewing*; after her first molt, or (sometimes) after a molt in confinement, she is *intermewed*. Mending the feathers artificially—a necessary operation if any have been accidentally broken—is termed *imping*; blunting bill and talons, *coping*. The *cadge* is a frame of wood with four legs, carried by means of straps passed over the bearer's (the cadger's) shoulders, and used when there are several casts of hawks to be taken to the field. Falcons are very pugnacious, and if not kept separate would soon kill each other. The *screen* or *perch* is a perch guarded by a falling piece of canvas to support the hawks in case of their leaping down from their block; upon this the hawks are placed at night in an apartment called the *mews*.

Bibliography. The best of the older works are those of Turberville, published in 1575, and that of Sir John Sebright (London, 1828). For more recent treatises, consult: Salvin and Broderick, *Falconry in the British Isles* (London, 1873); Freeman and Salvin, *Falconry, its Claims and Practice* (ib., 1859); Freeman, *Practical Falconry* (ib., 1869); Breck, "An Ancient Sport in the New World," in *Outing*, vol. lxiii (New York, 1914), a readable account of the author's experiments in falconry with a Cooper's hawk; Harting, *Bibliotheca Accipitraria: A Catalogue of Books, Ancient and Modern, Relating to Falconry* (London, 1891).

FALDSTOOL, fald'stool (OF. *faldestool* or *faudestuel*, ML. *faldistolium*, from OHG. *faldem*, fold, and *stol*, chair). (1) In ecclesiastical usage, a folding chair on which a bishop sat when not occupying his throne in his cathedral, or when in another church or cathedral. Other

prelates having the right to full pontificals also used it. (2) In the English church the name is used for the folding stool on which worshippers kneel in devotions; especially that on which the kings kneel at consecration. (3) A small desk in the churches from which the litany is read is sometimes called the faldstool.

FALEME, fà-là'ma. An important tributary of the Senegal River, in west Africa, rising in the French dependency of Futa-Jallon and flowing into the Senegal from the south (Map: Africa, C 3). The direction of its course is a little west of north, and its length is estimated at about 300 miles.

FALERII, fà-lè'r-i. A city in the southern part of Etruria, west of the Tiber and the Sabini and north of Mount Soracte. The inscriptions show that its inhabitants, the Falisci, were not Etruscans, but were closely allied to the Latins. In the early Roman annals Falerii appears as allied with Veii and other neighboring enemies of Rome; it finally joined the Roman League, however, it is said, in 343 B.C. For some unknown reason it revolted towards the close of the First Punic War, 241 B.C., and was then destroyed by the Romans, who compelled the inhabitants to settle in the plain near by, where is now the village of Santa Maria di Falleri. Here a Roman colony was settled in the time of the triumvirs, or later, whence the place took the name of Colonia Junonia Faliscorum. But this Roman Falerii does not appear to have ever acquired any importance, for the temple which anciently attracted so many pilgrims stood on the site of the older town. This temple, found at Lo Scotaso, in 1888, was of wood, with decorations of colored terra cotta. In the eleventh century the inhabitants removed to the strong position of the ancient Falerii, which finally obtained the name of Cività Castellana (q.v.). Ruins of the Roman or later Falerii, consisting of a part of the ancient walls, well preserved, are still visible; in some places these walls are 56 feet high and 7 to 9 feet thick; 50 towers are still preserved. Excavations in the neighborhood of the more ancient town have led to the discovery of extensive cemeteries, containing a series of graves, of great value as indicating the growth of civilization in Italy. Consult: Dennis, *Cities and Cemeteries of Etruria* (London, 1883); *Notizie degli Scavi* (Rome, 1879, 1882-83, 1886-88, 1909, 1911); Nissen, *Italische Landeskunde*, vol. ii (Berlin, 1902).

FALERNIAN WINE (Lat. *Falernum*, *Falernum vinum*), one of the favorite wines of the Romans, so called from the Ager Falernus, the district in which it was grown, which lay in the northern portion of Campania, between the Massican hills and the northern bank of the Volturnus. It is described by Horace as, in his time, surpassing all other wines in repute. In the time of Pliny, however, Falernian wine had already, owing to a want of care in its cultivation, begun to decline in quality. A wine produced in this district is still known as Falerno. Consult Nissen, *Italische Landeskunde*, vol. ii (Berlin, 1902).

FALERNUS AGER. See FALERNIAN WINE.

FALGUIÈRE, fàl'gyâr', JEAN ALEXANDRE JOSEPH (1831-1900). A French sculptor and painter, born in Toulouse. He studied in Paris under Carrière, Belleuse, Chenillon, and Joffroy, and won the Prix de Rome in 1859. While still at Rome, he sent to the Salon his "Winner of

FALCONS AND FALCONRY

1. A FALCONER OF THE 17th CENTURY, CARRYING HAWKS AFIELD.

2. GOSHAWK (*Astur palumbarius*).

3. KESTREL (*Tinnunculus alaudarius*).

4. PEREGRINE FALCON (*Falco peregrinus*), on portable perch.

5. GYRFALCON (*Falco gyrfalco*).

6. A FALCON'S HOOD.

7. A FALCON'S JESSE, WITH BELLS.

the Cock Fight" (1864, now in the Luxembourg), a work breathing the very spirit of antiquity; it assured his reputation. In 1868 he gained the medal of honor with "Tarcisus Martyr" (Luxembourg), the most personal of his creations. Falguière was essentially a realist, of great natural talent and with a profound love of nature and life, but lacked thoughtfulness and was too impatient for careful execution in marble. His best works, besides the two early ones mentioned, are his commemorative statues, including "St. Vincent de Paul" (Panthéon), "Corneille" (Théâtre Français), "Gambetta" (Amiens Museum), "Lamartine" (in Maçon), and "Lafayette" (in Washington)—all of which are good in expression and pose and show psychological insight. A series of bold but often rhythmically poetic nudes, such as "Eve," "Diana," "Heroic Poetry," "The Woman with the Peacock" (1890), and "The Dance" (1896), gained him the appellation of the "Parisian Praxiteles." His ambitious groups, such as the "Triumph of the Republic"—a large bronze quadriga on the Arc de Triomphe—and the groups for the Trocadéro and the Panthéon, were not equally successful. Although primarily a sculptor, his paintings, such as "Fan and Poniard" and "Spanish Dwarfs" (Luxembourg), in the manner of Velazquez and Goya, are robust and well executed. Falguière received many medals and was officer of the Legion of Honor (1878) and member of the Institute (1882). Consult: Bénédite, "Alexandre Falguière," in *Librairie de l'art* (Paris, 1902); Geoffroy, in *Gazette des Beaux Arts* (ib., 1900; Eng. trans.); Eaton's *Handbook of Modern French Sculpture* (New York, 1913).

FALIER, fá-lyár, MARINO (c.1285-1355). A celebrated Venetian Doge, elected to office in 1354, when about 70, after rendering the Republic great service in many different offices, administrative, military, and diplomatic. According to the account usually given, his bitter resentment was aroused by an offensive libel on himself, the author of which owed him a grudge. The punishment imposed on the young noble by a patrician tribunal seemed to Falier wholly inadequate, and in order to avenge this double slight he organized an audacious plot with the object of overthrowing the Republic and massacring the heads of the aristocracy, to be followed by his own assumption of sovereign power. The real facts have always remained obscure, but it seems probable that Falier was trying to make himself supreme lord of Venice and many of the people, exasperated by the conduct of the nobility, were willing to aid him. The conspiracy was, however, revealed on the eve of its execution, and Falier was arrested. He suffered death by decapitation on April 17, 1355. In the hall of the Great Council, which contains the portraits of all the doges, the space allotted to that of Falier is draped with a veil of sable, and bears the following inscription: "Marino Falier, executed for treason." Byron has made the fate of Falier the subject of a drama. Consult Brown, *Studies in the History of Venice*, vol. i (London, 1907), and Lazzarini, *Marino Faliero, la Congiura* (Venice, 1897).

FALK, JOHANN DANIEL (1768-1826). A German author, and philanthropist, born in Danzig. After studying theology at the University of Halle, he turned to literature, wrote several satirical poems, and in 1797 became, through

Wieland (q.v.), a member of the Weimar literary circle. When Napoleon's army invaded the duchy in 1806, his knowledge of the French language enabled him to moderate to some extent the spoliation of the country, and later caused him to be created a counselor of legation. In 1813 he founded the Society of Friends in Need, and in the same year established at Weimar the first institution in Germany for the care and education of neglected and orphan children. This was taken over by the state in 1829 and still exists as the Falk'sches Institut. Falk's publications include: *Der Mensch und die Helden* (1798); *Oceaniden* (1812); *Goethe aus naherm persönlichen Umgange dargestellt* (1832: 3d ed., 1856). Consult Stein (Nietschmann), *Johannes Falk: Ein Zeit- und Lebensbild* (Halle, 1881).

FALK, Max (1828-1903). An Hungarian politician and publicist. He was born and educated at Pest, entered the Polytechnic Institute at Vienna, and became a member of the Academic Legion in 1848. As editor of the *Wanderer* of Vienna, he strongly advocated the restoration of the Hungarian constitution, and, soon after the negotiations concerning the compromise with Hungary had been resumed, he was appointed private lecturer on Hungarian history and literature to the Empress Elizabeth. As editor in chief of the *Pester Lloyd*, he made his influence widely felt. In 1869 he was elected to the Hungarian Parliament, where he identified himself with the party of which Deak, Eötvös, and Andrássy were the most prominent representatives. With Brachelli he published the twelfth German edition of Gallietti's *Allgemeine Weltkunde* (1850-60). His independent literary productions, which include the biography, *Graf Stephan Széchenyi und seine Zeit* (1868, also published in Hungarian), appeared chiefly in the *Oesterreichische Revue*. He wrote also *Rück Erinnerungen an die Königin Elisabeth* (1902).

FALK, fälk, (PAUL LUDWIG) ADALBERT (1827-1900). A Prussian statesman, born at Metschkau, Silesia, Aug. 10, 1827. He was the son of a Protestant clergyman and studied law at Breslau and Berlin. In 1847 he entered the state service of Prussia; in 1850 he was appointed Assistant State Attorney at Breslau and in 1853 State Attorney at Lyck. In 1858 he was elected to the Prussian Chamber of Deputies and served as a member of the committee on petitions, budget, and military affairs (1858-61). In 1862 he was appointed counselor of the Court of Appeals in Glogau, Silesia, and in 1867 was elected to represent that district in the provisional Parliament of the North German Confederation. In 1868 he was permanently assigned as counselor of the Ministry of Justice and devoted himself zealously to the new codification of laws for the North German Confederation, performing a similar work afterward for the German Empire. In 1871 the Emperor appointed Dr. Falk one of the representatives of Prussia in the Federal Council. In 1872 he succeeded Von Mühler as Prussian Minister for Ecclesiastical Educational Affairs (Kultusminister). He introduced a law, passed March 11, 1872, according to which the supervision of all schools was declared to be the exclusive prerogative of the state. It was carried against the united efforts of the Roman Catholic and conservative Protestant parties of the Prussian Parliament. Falk continued by a number of

measures to assert further the exclusive right of the state to legislate in all school affairs. A rescript of June 15, 1872, excluded members of ecclesiastical orders and congregations from positions in the public schools. In May, 1873, an Act was passed conferring upon the state the right of supervising Roman Catholic seminaries. It was required also that candidates for the clerical office should undergo a certain amount of secular training at the universities, and that every ecclesiastical appointment should receive the sanction of the secular authorities. A royal tribunal for ecclesiastical matters was also set up. This legislation, which the Pope denounced as invalid, Feb. 15, 1875, was disregarded by the Roman Catholic bishops, and Bismarck, supported by Falk, imposed penalty after penalty in order to establish the supremacy of the state. Refractory bishops were imprisoned, deposed, and banished; the contributions of the government were withdrawn from the clergy who incurred its displeasure; religious orders were dissolved; and the administration of church property was taken from the clergy and invested in bodies of laymen. Dr. Falk's policy was no more acceptable to the orthodox Protestant party than to the Roman Catholics, and the difficulties of his position led him to resign in July, 1879. The Falk laws were modified by his successors, Von Puttkamer and Gossler, despite the opposition of Falk as member of Parliament. In 1882 he accepted a high judicial appointment at Hamm and died there, July 7, 1900. His *Reden gehalten in den Jahren 1872-79* appeared at Berlin in 1880. Consult Fischer, *Adalbert Falk* (Hamm, 1900), and J. F. von Schulte, "Erinnerungen und Erlebnisse mit Adalbert Falk," in *Deutsche Revue*, vol. xxxii (Stuttgart, 1876). See KULTURKAMPF.

FALKE, fälke, GUSTAV (1853-1916). A German poet, born in Lübeck, nephew of Jakob von Falke and of Johannes Friedrich Gottlieb Falke. He was educated at the Lübeck Catharinum, was a bookseller for seven years, and then (after 1878) a music teacher in Hamburg, and in 1903 on his fiftieth birthday received an annual grant of 3000 marks from the Hamburg Senate and Commonality. He then devoted himself entirely to literature, especially poetry, although he had previously written fiction, including *Aus dem Durchschnitt* (1892), *Landen und Stranden* (1895), and *Der Mann im Nebel* (1899). In his poems he was at first rather markedly influenced by von Lilienron, but later showed more individuality. Among his volumes of verse, besides some juveniles, were: *Mynheer der Tod* (1892); *Fanz und Andacht* (1893); *Neue Fahrt* (1897); *Mit dem Leben* (1899); *Hohe Sommertage* (1902); an epic in hexameters, *Der gescheitete Kater* (1904); *Frohe Fracht* (1907); Hamburg (1908) in the series called *Städte und Landschaften*.

FALKE, JOHANNES FRIEDRICH GOTTLIEB (1823-76). A German historian, brother of the preceding. He was born at Ratzeburg and studied theology, philology, and history at Erlangen. In 1855 he was appointed a custodian, and in 1856 secretary of the Germanic Museum at Nuremberg; and in 1859 he became director of the manuscript department in that institution. In 1862 he was appointed secretary of the government archives at Dresden, where he occupied the position of archivist at the time of his death. He was founder and coeditor of the *Zeitschrift für deutsche Kulturgeschichte* (1855-59), a peri-

odical devoted to the economic history of Germany. His independent works include: *Geschichte des deutschen Handels* (1859-60); *Die Hanse als deutsche See- und Handelsmacht* (1862); *Geschichte des deutschen Zollwesens* (1869).

FALKENHAYN, GENERAL ERIC VON. German War Minister. See VOLUME XXIV.

FALKENSTEIN, fälk'en-stin, JULIUS AUGUST FERDINAND (1842-). A German explorer. He was born in Berlin, and studied medicine and geology at the university in that city. As a member of the exploring expedition sent by the African Society of Germany to Loango (1873-76), he made important scientific discoveries. His valuable collections included the first gorilla ever transported alive out of Africa. In 1881 he founded the General School Association of Germany, a society formed for the strengthening of German influence in the schools of other countries. His publications include: *Die Loango-Küste in 72 Original-Photographien* (1876); *Die Loango Expedition* (1879); *Afrikan's Westküste: Vom Ogoive bis zum Damara Land* (1885); *Aerzlicher Reisebegleiter und Hausfreund* (10th ed., 1893).

FALKIRK, fäl'kirk (named from a church built during the eleventh century by Malcolm Canmore). A parliamentary and municipal burgh and market town of Stirlingshire, Scotland, about 3 miles southwest of its seaport, Grangemouth, on the Firth of Forth, and 24 miles northwest of Edinburgh (Map: Scotland, E 4). Falkirk consists principally of a long, irregular street. There is an equestrian statue of the Duke of Wellington, erected in 1854. Among its notable buildings are the town hall, county buildings, art school, free library, and cottage hospital. Its parish church has some ancient monuments, but was itself rebuilt in the year 1810. The church, church lands, and barony belonged of old to the abbey of Holyrood. It is the centre of the Scotch iron-founding trade, the principal works being at Carron. There are several extensive collieries in the neighborhood as well as distilleries. Its three annual cattle fairs (trysts), once so famous, have practically been supplanted by a weekly market. Falkirk is a station on the North British Railway and is connected with the east and west coasts by the Forth and Clyde Canal. Pop., 1901 (municipal burgh), 20,271; 1911, 33,574. The town is of great antiquity, having been a place of some importance as early as the eleventh century. On a small eminence near Falkirk an important engagement was fought, July 22, 1298, between the English under Edward I and the Scottish army under William Wallace (q.v.). The Scottish forces were outnumbered nearly three to one and were driven from the field with the loss of 20,000 men. Wallace was forced to seek concealment, and Edward's hold on the southern part of Scotland was strengthened. Near Falkirk, Jan. 17, 1746, Charles Edward, the young Pretender, defeated an English army under General Hawley.

FALKLAND, fäl'land. A royal burgh in Fifeshire, Scotland, situated at the northeastern base of the Loonod Hills, 22 miles north of Edinburgh (Map: Scotland, E 3). Pop. 1901 (civil parish), 2229; 1911, 2356. It is noted for its sixteenth-century royal palace, built upon the site of an ancient castle of the Macduffs, thanes of Fife, and now the property of the Marquis of Bute, who has had it carefully restored. It is rich in memories of the births,

lives, imprisonments, and murders of Scottish princes and kings. In 1715 it was garrisoned by Rob Roy (q.v.). Consult Wood, *Historical Description of Falkland* (Edinburgh, 1888).

FALKLAND. The first novel of Bulwer Lytton, named after its hero, and published anonymously in 1827. It is a singularly gloomy work, described by the author as "to me what the *Sorrows of Werther* was to Goethe."

FALKLAND. The leading character in William Godwin's novel *Caleb Williams*.

FALKLAND, LUCIUS CARY, second Viscount (c.1610-43). An English writer and politician. He was educated at Trinity College, Dublin, and at St. John's College, Cambridge. About 1629 he inherited his maternal grandfather's fortune and devoted himself to literature. By his father's death, in 1633, he became Viscount Falkland. In 1633 he was created a gentleman of the Privy Chamber to Charles I and took part in the expedition against the Scots in 1639. In 1640 he entered Parliament as member for Newport and the Isle of Wight. He opposed Laud during the Short Parliament and in the Long Parliament took sides against Strafford. He became Secretary of State in 1642, and at the outbreak of the Civil War he joined the King's party. But he was so dissatisfied with both parties that he courted death, and was killed at the battle of Newbury. His principal work is *A Discourse on the Infallibility of the Church of Rome* (1660). His poems, edited by A. Grosheart, were published in 1871. Consult Marriott, *The Life and Times of Lucius Cary, Viscount Falkland* (New York, 1907), and Longueville, *Falklands* (London, 1897).

FALKLAND ISLANDS. A British colony in the South Atlantic, between lat. 51° and 52° 45' S. and long. 57° 20' and 61° 46' W. (Map: South America, H 8). The colony is about 300 miles east of the Strait of Magellan and 1100 miles south of Montevideo. The Falkland Islands consist of East Falkland (about 3000 square miles) and West Falkland (2300 square miles), the two being separated by Falkland Sound, and about 100 small islands (nearly 1200 square miles); total area, about 6500 square miles. South Georgia, an island lying with several islets about 54° 30' S. and 36° to 38° W., is a dependency; area of the group, about 1000 square miles. Also regarded as dependencies of the colony are the South Shetlands, Graham's Land, the Sandwich group, and the South Orkneys (on which the Argentine government has, with British consent, established a meteorological station).

East and West Falkland are for the most part low-lying moorland interspersed with rocks. A few mountains exceed 2000 feet, the highest being 2290 feet, in West Falkland. (South Georgia is much more mountainous, at least one mountain exceeding 5000 feet.) The soil is chiefly soft peat; there are no trees and little vegetation besides grass. The coasts are deeply indented, and there are numerous well-protected harbors. The climate is not unhealthful, but cool; the range of temperature in the summer is 40° to 65° and in the winter 30° to 50°, the mean being 42°. The weather is often disagreeable on account of strong winds and drizzling rains, but the annual rainfall seldom exceeds 25 inches. There are practically no roads, and communication is by sea or horseback. The only industries are sheep farming and whaling. Live stock in 1912: 711,367 sheep, 7520 cattle, 3665

horses, and 60 swine. In 1910 imports and exports were valued at £94,294 and £308,930 respectively; in 1912, £93,264 and £623,875. The trade is largely British. The wool export in 1911 was 4,643,781 pounds. In the dependencies the whaling industry has recently made rapid progress. Exports from South Georgia in 1911 (not included above) were valued at £426,438. There is monthly mail communication with England. The population, which is almost entirely on the two principal islands, was 2043 in 1901 and 3275 in 1911 (2370 male, 905 female). The inhabitants are nearly all British. Stanley, with a good harbor, on the east coast of East Falkland, is the only town; pop., 905. It has a government and a Roman Catholic school. Traveling schoolmasters visit other parts of the islands. The colony is administered by a governor; there are an executive and a legislative council, all members being appointive.

The Falkland Islands were discovered by Davis in 1594 and visited by Hawkins two years later. France took possession in 1764, and a small colony was established; this in 1766 was bought by the Spaniards. The English took West Falkland in 1767, but were driven out by the Spaniards. In 1820 a settlement was made by the Republic of Buenos Aires. The islands were finally taken by Great Britain in 1832, and in 1843 a civil administration was established. The colony has been self-supporting since 1885. In 1912 the revenue was £34,037; expenditure, £33,508. There is no public debt. A wireless station was set up at Stanley in 1912. Consult *British Empire Series* (London, 1900), and Murdock, *From Edinburgh to the Antarctic, 1892-93* (London, 1894).

FALKNER, falk'nēr, ROLAND POST (1866-). An American statistician, born at Bridgeport, Conn. He graduated at the University of Pennsylvania in 1885 and afterward studied at Berlin, Leipzig, and Halle (Ph.D., 1888). For three years (1888-91) he was an instructor, and for nine years (1891-1900) associate professor of statistics, in the Wharton School of Finance and Economy (University of Pennsylvania). In 1900 he was appointed chief of the division of documents in the Library of Congress at Washington. He was secretary of the International Monetary Conference of 1892, and edited, from its beginning in 1890 until 1900, the *Annals of the American Academy of Political and Social Science*. Of this latter organization he was first vice president in 1896-97. From 1904 to 1907 he served as Commissioner of Education in Porto Rico; from 1908 to 1911 he was statistician in charge of school inquiries for the United States Immigration Commission, and he then became assistant director of the census. Besides a translation of August Meitzen's *History, Theory, and Technique of Statistics* (1893), he published much on statistical subjects, and contributed to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

FALKNER, THOMAS (1707-84). An English Jesuit missionary, born in Manchester. As surgeon on board the *Assiento*, a slave ship belonging to the South Sea Company, he sailed to the Guinea coast in 1731 and thence to Buenos Aires, where he was so kindly treated by the Jesuits during a dangerous illness that he determined to enter their order. He was ordained in May, 1732, and during the following 35 years he worked as a missionary in Paraguay and the vast region between the Rio de la Plata and the

Strait of Magellan, mostly among the natives. Upon the expulsion of the Jesuits from South America in 1768, he returned to England, where he was chaplain to several distinguished Catholic families. His religious work was materially aided by his medical and surgical skill. He left several works in manuscript, including four volumes, *Botanical, Mineral, and Like Observations on the Products of America* (date unrecorded), and published (1774) *A Description of Patagonia and the Adjoining Parts of South America*, which seems to have been edited (and spoiled) by a friend.

FAULKNER ISLAND. An island in Long Island Sound, about 5 miles southeast of Guilford, Conn. It has a lighthouse, with a white flashing light, 93½ feet above mean high water, which is visible for 15 (nautical) miles, and a fog-signal siren.

FALKÖPING, fäl'ch'p'ing. A small town and railway junction in Skaraborg, Sweden (Map: Sweden, E 7). Pop., 1899, 3066; 1910, 4800. It is the scene of the victory in 1389 of Margaret, Queen of Denmark and Norway, over Albert of Mecklenburg, King of Sweden, which enabled her to unite Sweden with the other kingdoms. See, on the Union of Kalmar, under **KALMAR**.

FALL, DOCTRINE OF THE. The term is especially used for that form of the explanation of the origin of sin and human evil which appears in the later Jewish, Mohammedan, and Christian religions. It is based on the supposition that the story of Eden in Gen. ii and iii represents, in some form, an historical event. Until modern times the story was taken literally. Later Judaism began to use it as the explanation of sin in the race. This is seen in the Wisdom of Solomon, an Alexandrian Jewish book of the first century B.C. (ii. 23 ff.), in 2 Esdras, of the first century A.D. (iii. 21 f, iv. 30, vii. 46 ff., viii, 35). In the New Testament it appears only in Paul's writings (i Cor. xv. 21 f., Rom. v. 12 ff.). These show us that, in the Jewish thought of the time, sin and death were regarded as coming upon man because of Adam's sin. Some kind of unity between man and his supposed ancestor Adam is assumed. These passages, however, give no answer to the question how Adam, if created pure by God, came to sin, nor what is the nature of the connection between man and his ancestor, nor whether man is "guilty of Adam's sin." Such questions arose when Christianity entered the Greek world, and philosophical theology began to be formed. By the Greek fathers the consequences of Adam's fall were regarded as physical and moral death, the control of unregenerate man by Satan, and the great attractiveness of evil. They held that the fall was the result of the temptation of Satan. Augustine, the greatest systematic theologian of the Christian Church, added to these results the complete enslavement of the human will, so that man can now choose good only by the grace of God. Pelagius refused to admit the complete enslavement of the will, since this would, he held, leave man irresponsible for his own personal sin. Augustine met this position by his theory of the unity of the human race. All human nature was deposited in the first man and was, as it came from God, pure. It was corrupted by Adam's sin and, in that corrupt state, comes into the individuality of each of Adam's descendants, so that all are responsible for the consequences of the first sin and are

guilty, not as separate persons, but as members of the race which shares human nature from Adam. This solidarity of the race rests upon ideas of Platonic realism and was essential to the Augustine idea of the fall and its results. See **ORIGINAL SIN**.

The problem of how man, created pure, could fall, was discussed more fully by the Calvinistic theologians and their opponents. Some Calvinists held that the fall was decreed by God; others that it was only permitted. (See **CALVINISM**.) The Arminians, like the Pelagians, held that the fall did not entirely destroy the power of a good choice, but weakened it, and that man is not guilty for original sin.

Modern biblical scholarship regards the story of Adam not as history, but as a myth, whose original purpose was not to explain the origin of sin, but of the evils of life. It rejects the story, therefore, as a legitimate basis for theological speculations. Evolution has taken the place of Genesis as the explanation of the origin of man. This involves certain radical changes. Man has arisen from the brutes, and his growth has been gradual. There was no fall from pristine purity, for there is no evidence that pristine purity ever existed. Sin came in when man began to perceive higher possibilities and chose the lower instead of the higher. It is the survival of selfishness and passion after selfishness and passion are seen to be wrong; but to call that experience a fall is no more correct of the race than of each individual child. The story of Adam may be treated as an allegory of what happens, not once for all, but in the life of every man; it becomes, not the basis of a metaphysical theology, but the parable of human experience. Men are tempted by the appeal to the senses from without; their desires respond; they choose what opposes known commands of the higher laws; and they, and others with them, suffer in consequence. Physical death is no longer regarded as the result of sin. It is an incident of organized life, long antedating the evolution of man. The problems of predestination, free will, and the connection of man with the sins of his ancestors are swallowed up in the larger problems of an order of the world, of human consciousness, and of heredity, which modern thought is for the most part content to leave as yet unsolved. Consult: Fisher, *History of Christian Doctrine* (New York, 1896); Harnack, *History of Dogma* (Boston, 1894-99); Clarke, *Outline of Christian Theology* (New York, 1899); Brown, *Christian Theology in Outline* (ib., 1906); Mackintosh, *Christianity and Sin* (ib., 1914).

FALL, ALBERT BACON (1861-). An American legislator, born at Frankfort, Ky. After an education in country schools he taught school, studied law, and was a practicing attorney from 1889 to 1904. In 1898-99 he was captain in the First Territorial Volunteer Infantry. He acquired property interests in lumber, lands, stock farms, and railroads in New Mexico and in mines in Mexico. He served several terms in the New Mexico Territorial Legislature, twice as Attorney-General, as Associate Justice of the Supreme Court of New Mexico, and as a member of the Constitutional Convention. Upon the admission of New Mexico to statehood he was elected United States Senator for the short term in 1912, and he was reelected for the term 1913-19.

FALLACY (Lat. *fallacia*, deception, from

fallax, deceitful, from *fallere*, to deceive; connected with Gk. *σφάλλειν*, *sphallein*, to overthrow, Skt. *phal*, to deceive, Lith. *pàlti*, OHG. *fallan*, Ger. *fallen*, Icel. *fallay*, AS. *feallan*, Eng. *fall*). The incorrect performance of the process of reasoning, so as to lead to an unwarranted conclusion. The science of logic finds that sound reasoning proceeds in accordance with certain rules, and when any of these rules is violated, a logical fallacy is the result. There has been much discussion as to the proper classification of fallacies, and even now no agreement has been reached. But it is obvious that, as a fallacy is a violation of some logical law, an adequate exhibition of the correct processes of thought will carry with it an adequate exhibition of the possible fallacies. There is only one further difficulty. Language is not a perfect instrument for the expression of thought; and the same kind of logical mistake may be expressed in several ways, and each one of these modes of expression may be important enough to require treatment. This would lead to the old traditional classification into fallacies not complicated by verbal difficulties (*extra dictionem*) and those so complicated (*in dictione*). Those not complicated by verbal difficulties need no detailed treatment, as they are all obvious violations of some logical rule. All that need be done here is to give the names of some of the most common fallacies *extra dictionem*. Thus, the fallacy of the *undistributed middle* is a violation of the syllogistic law that the middle term should be distributed at least once. The *illicit* process of the major or minor term is a violation of the syllogistic law that neither extreme (major or minor) may appear in the conclusion in a quantity exceeding that belonging to it in the premises. The *quaternio terminorum*, or *four terms*, violates the law that a syllogism should have three, and only three, terms. The *double negative* violates the law that at least one of the premises of every syllogism that is reduced to proper expression should be affirmative. The *petitio principii*, in the form in which it belongs here, violates the rule that there should be three distinct propositions in a syllogism; the violation occurs when the conclusion to be proved is assumed in a premise. But any really significant *petitio principii* is a fallacy *in dictione*, for it is only when the identity of conclusion and premise is masked that a *petitio principii* is liable to be seriously made or seriously taken. Still another form of the *petitio principii*, called *circulus in probando*, is a fallacy *extra dictionem* which is possible only when there are two or more syllogisms interrelated in such a way that the conclusion of each syllogism is the premise of some other. In this way the conclusion, or what is proved, in one syllogism is used in another syllogism as a basis of proof for a proposition which in its turn ultimately comes to be used as a basis of proof for the first conclusion. Hence the Latin name, meaning a circular process of reasoning. In English this fallacy is often called a *vicious circle*. The term *petitio principii* is sometimes applied to arguments which are not fallacious at all, but which employ as premises propositions the truth of which is not admitted by those to whom the argument is addressed. The fallacy of the *consequent* is a violation of the law that in hypothetical propositions the truth of the apodosis (consequent) is not to be taken as carrying with it the truth of

the protasis (antecedent). *Non causa pro causa*, *post hoc ergo propter hoc*, and *false cause* are names of a fallacy which consists in violating the inductive canon that a temporal antecedent must be distinguished from a cause. The fallacies *in dictione* are not usually classified according to any systematic principle, but names are given to the most frequent or the most subtle of them. A very comprehensive distinction is that between fallacies in which the disguise of the illogical operation is effected by a single word (equivocation), and those in which it is effected by the structure or other peculiarity of a sentence or phrase as a whole (amphiboly). Equivocation or amphiboly, when it appears in the middle term of a syllogism, is called an *ambiguous middle*. If the equivocation arises from misplaced emphasis or accent, it is called the fallacy of *accent*. The so-called fallacies of composition and division may be either equivocations or amphibolies. Thus "all men" may mean either every man singly (distributive) or the totality of mankind taken as a unit (collective). Any violation of logical rules arising from failure to make this distinction is a fallacy of *composition* when the distributive use is mistaken for the collective; in the reverse case there is a fallacy of *division*. These same fallacies of composition and division are amphibolies when the ambiguity between distributive and collective use lurks not in a single word (as above in the word "all"), but in a phrase. Thus, from the two premises "the animals walk two by two," and "Two and two are four," to argue that "The animals walk by fours" is a fallacy of composition arising from an amphiboly. Another way in which a fallacy may arise is from neglect to observe a qualification tacitly but really made. Thus, the statement "What I bought yesterday, I ate to-day" in civilized communities really means "What I bought in the marketable form yesterday, I ate to-day after it had undergone whatever change was necessary to make it edible." If now a cavalier, refusing to recognise these tacit qualifications, were to say "You bought raw meat yesterday, didn't you?" he would suggest the inference that I ate raw meat to-day. This is called *argumentum a dicto simpliciter ad dictum secundum quid*—the assumption that qualification makes no difference in the truth of a statement.

Another form of fallacy screened by verbal expression is that in which a conclusion is established which in expression resembles the point one starts out to make, but which in reality has nothing to do with that point. This is called *ignoratio elenchi*, or *irrelevant conclusion*. The so-called fallacy of *complex question* is nothing but an unwarranted assumption in putting a question. The stock example is the inquiry, "Have you stopped beating your mother?" It is more important to know what the fundamental rules of correct thinking are than to know the names given to these trifling violations of such laws. See ARGUMENT. Consult: Sidgwick, *Fallacies* (London, 1888); Akermann, *Popular Fallacies* (Philadelphia, 1908); Roberts, *Fallacies and Facts* (London, 1911); and the logics of Mill, Creighton, etc. See also LOGIC; INDUCTION; SYLLOGISM.

FALL ARMY WORM. See GRASS WORM.
FALLEN TIMBERS, BATTLE OF. See WAYNE, ANTHONY.

FALLFISH. The chub (*Semotilus bullaris*) of the Mississippi valley. The "red fallfish" is

one of the shiners (*Notropis rubricroceus*), the male of which is "blue with a black lateral band, and the whole body more or less suffused with blood red."

FALLIÈRES, fà'lyâr', CLÉMENT ARMAND (1841-). Eighth President of the French Republic. He was born at Mézin (Lot-et-Garonne), of peasant stock, studied law, acted for a number of years as mayor of Nérac, and in 1876 was elected to the Chamber of Deputies, where he sat in the Republican Left and was an opponent of the royalists. From May, 1880, to January, 1882, during the Ferry ministry he was Undersecretary in the Ministry of the Interior, became head of that department in August of the latter year in the cabinet of Duclerc. Subsequently he was Minister of Public Instruction under Ferry (1883-85), of the Interior under Rouvier (1887), of Justice and Public Instruction under Tirard (1887-88, 1889), and of Justice again under Freycinet (1890-92). In 1890 he was elected to the Senate, and in 1899 became President of that body, being reelected eight times in succession. In 1906 he was the candidate of the Radical Republican and Socialist "bloc" for President of the Republic to succeed Loubet. His opponent was Paul Doumer (q.v.), who possessed the support of the reactionary elements. This, combined with M. Fallières's popularity, insured his success, and on January 16 he was elected by the National Assembly by 449 votes to 371. He assumed office on Feb. 18, 1906. On assuming office he indicated his policy by grouping in the same ministry Poincaré, Moderate (*Finance*), Savrien, Radical (*Justice*), Clemenceau, Socialist Radical (*Interior*), and Briand, Socialist (*Education*), thus displaying a tendency towards the Left and a desire to give greater recognition to the working classes. In 1909 a separate Ministry of Labor was formed to which a Socialist was appointed. Fallières was succeeded in 1913 in the presidency by M. Poincaré. Consult: Weill, *Histoire du parti républicain en France* (Paris, 1900); Hanotaux, *Histoire de la France contemporaine* (Eng. trans., 4 vols., 1903); Sylvin, *Célébrités contemporaines* (Paris, 1883).

FALLING BODIES. This term is applied to bodies which are unsupported at the surface of the earth, and which under the influence of gravity (see GRAVITATION) fall or move towards its centre. The action follows from the attraction which the earth exerts on matter, and the acceleration which is thus produced is a uniform quantity for any one point—an average value being about 32.2 feet, or 981 centimeters, per second per second, though the precise quantity depends on the position on the earth's surface. This quantity it is usual to denote by g ; therefore, if we let t represent the time and v the velocity, the velocity produced at the end of any period is $v = gt$. The experimental verification of the laws of falling bodies can be accomplished with the aid of Atwood's machine; and under that title will be found a description of the apparatus and its methods of use, together with the results which can be obtained with it. The article GRAVITATION, which gives a complete explanation of the phenomena of freely falling bodies, and also ACCELERATION and MECHANICS, should be read in this connection.

FALLING SICKNESS. See EPILEPSY.

FALLMEYER, fäl'me-r'ër, JAKOB PHILIPP (1790-1861). A German traveler and historian, born at Tschüttsch, in the Tirol. After

studying at Brixen, Salzburg, and Landshtut, he was appointed to the chair of history and philology at Landshtut. In 1831 he accompanied the Russian general Count Ostermann-Tolstoy in a journey to the East. On returning he resided with this nobleman until 1840 at Geneva, and in the course of the next eight years twice revisited the East. In 1848 he was appointed professor of history in the University of Munich, and for a short time he sat as a deputy in the Frankfort Parliament, but after 1850 he lived privately in Munich. Fallmerayer was a distinguished polyglot. His opinion concerning the Slavic origin of the modern Greeks and of their language excited a great controversy. His principal works are: *Geschichte des Kaisertums Trapezunt* (1831); *Geschichte der Halbinsel Morea im Mittelalter* (1830-36); *Fragmente aus dem Orient* (1845). His *Complete Works* were published in three volumes in Leipzig, 1861.

FALL OF THE HOUSE OF USHER, THE. A short story by Edgar Allan Poe, which appeared in the *Gentleman's Magazine* about 1840. One of the most noted of his tales, it is a gruesome mixture of madness, death, and ruin.

FALLON, MICHAEL FRANCIS (1867-). A Canadian Roman Catholic bishop. He was born in Kingston, was educated at the Christian Brothers' School and Collegiate Institute in that city, and afterward at Ottawa University, where he graduated in 1889. He also studied at the Gregorian University in Rome. On his return to Canada he became a member of the Oblat Order, and was for some time professor of English literature in Ottawa University, of which he was also vice rector for three years. In 1898-1901 he was rector of St. Joseph's Church, Ottawa, and in 1901-04 rector of the church of the Holy Angels, Buffalo, N. Y. From 1904 to 1909 he was provincial of the Oblat Order and in the latter year was appointed Bishop of London, Ontario.

FALLOPIAN TUBES (so called after Fallopio (q.v.), who is usually, but incorrectly, regarded as their discoverer), or OVIDUCTS. Canals about 4 or 5 inches in length in the human body, opening at their inner extremity into the upper angle of the uterus, and at the other end, by a fringed funnel-shaped termination, into the cavity of the peritoneum. This fringed or fimbriated extremity at certain periods grasps the ovary and receives the ovum, which is discharged by the rupture of the Graafian vesicle. (See OVARY.) The ovum usually passes along the Fallopian tubes into the uterus, where it is either impregnated by contact with one or more spermatozoa, is absorbed, or escapes with the vaginal mucus. Sometimes, however, the ovum becomes not only impregnated, but retained and further developed, in the Fallopian tubes, thus giving rise to one of the forms of extra-uterine pregnancy.

FALLOPIO, fäl-lō'pē-ō, or **FALLOPIUS**, GABRIELLO (c.1523-92). An Italian anatomist, born at or near Modena. If the date of birth assigned is correct, he was only 25 when he was promoted from the University of Ferrara to a professorship at Pisa, whence, after a few years, he was called to Padua, to succeed Vesalius (q.v.), who had been compelled by the Inquisition to resign his office. Tomassini states that Fallopius was born in 1490. He is classed, with Vesalius and Eustachio, as one of the founders of modern anatomy. He was succeeded by his favorite pupil, Fabricius ab Aquapendente.

He published numerous works in various departments of medicine, of which the most important is his *Observationes Anatomicæ, in Libros Quinque Digestæ* (1861), in which he corrects many errors into which his predecessor, Vesalius, had fallen. He was the first to describe with accuracy the ethmoid and sphenoid bones, and the minute structure of the ear (the canal along which the facial nerve passes, after leaving the auditory, is still known as the aqueduct of Fallopius), the muscles of the soft palate, and the villi and valvula conniventes of the small intestine. The tubes passing from the ovary on either side to the uterus which bear his name were known to and accurately described by Hierophilus and Rufus of Ephesus, 300 years before our era; but Fallopius discovered their function. In addition to his anatomical fame, he had a considerable reputation as a botanist. He was the superintendent of the botanical garden at Padua; and a genus of plants, *Fallopia*, has been named after him. A complete edition of his works, in four folio volumes, was published in 1600.

FALLOUX, fá'loo', ALFRED FRÉDÉRIC PIERRE, COUNT DE (1811-86). A French author and statesman, born at Angers, in the Department of Maine-et-Loire, of an ultraroyalist family. Falloux first drew attention to himself by two works characterized by admiration of the old Bourbon régime—*L'Histoire de Louis XVI* (Paris, 1840), and *L'Histoire de Saint-Pie V* (ib., 1844). He appeared in Paris as an orator and writer for the church and the Bourbon cause and was among the irreconcilables of the Right under the Orleanist monarchy. In the elections of 1846 he was chosen deputy for the Department of Maine-et-Loire. He followed the policy of a section of the clerical party in welcoming the republic after the revolution of 1848, and was elected to the constituent Assembly. He must be held responsible for the terrible "days of June," for he was the one who demanded the immediate dissolution of the national workshops. He advocated the dispatch of the papal relief expedition (1849) and, as a Minister of Instruction under Louis Napoleon, formulated the *loi falloua*, an educational law, greatly favoring the clergy. After the coup d'état he retired to his estates. He became an Academician in 1856. Between 1866 and 1870 he unsuccessfully sought to reënter politics. He made incessant war upon the Empire, especially after the Italian expedition of 1859, and played a leading rôle in the Catholic Liberal party which included Lacordaire, Montalembert, Dupauloup, and Prince Albert de Broglie. After the war with Germany his views became somewhat more liberal. He it was who proposed the fusion of Orleanist and Bourbon claims, thus gaining the distrust of the extreme Right. Furthermore, his liberal tendencies placed him at odds with the Ultramontanes, and he was almost excommunicated in 1876. Besides the works already mentioned, he wrote: *Le parti catholique* (Paris, 1856); *Souvenirs de charité* (ib., 1857); *Madame Sietchine, sa vie et ses œuvres* (ib., 1860); *La questione italiana* (ib., 1860); *Questions monarchiques* (ib., 1873); *Du Scepticisme politique* (ib., 1872); *De la contre Révolution* (ib., 1878); *De l'Unité nationale* (ib., 1880); *Études et Souvenirs* (ib., 1885). His memoirs were published under the title *Mémoires d'un royaliste* (ib., 1888). Consult Veuillot, *Le comte de Falloux et ses mémoires* (ib., 1888).

FALLOW (AS. *fealu*, yellow, Icel. *folr*, OHG. *falo*, Ger. *fahl*; connected with Lat. *pallidus*, pale, Gk. *πολιός*, *polios*, gray, Skt. *palita*, gray). Land allowed to rest without crops for a season, either tilled or untilled (*bare* or *black fallow*), or land on which an intercrop is grown to fit it for the main crop (*green fallow*). Fallowing is an agricultural practice of ancient origin. Wherever the system of bare fallowing, without manure, is practiced, it necessarily supposes that the soil is at least moderately fertile, for the practice is a species of soil robbery since its chief use is to liberate material from which plants may derive their food, and which is already stored up in the soil. It promotes weathering, which assists in rendering the mineral substances the soil contains more available. The plowing and stirring, by admitting air, promote decomposition, nitrification, and similar processes, which make both the organic and mineral constituents of the soil more available as plant food, and at the same time destroy insects and weeds that impoverish the soil and choke the crops. With improvements in the plow and other tillage implements and the rapid increase in use of manures and fertilizers during the last half century, the practice of fallowing has become less common than formerly. For summer fallow the land should be plowed deeply about the last of May, and the surface put in fine tilth. When the weeds spring up, they should be destroyed by surface tillage. If the land is to be seeded to wheat or rye, the last stirring of the soil should be given not later than the middle of August. The number of plowings and the amount of surface tillage required will depend upon a variety of conditions, but in some cases one deep plowing and one surface tillage will accomplish the desired purpose of destroying the weeds and preparing the soil for the succeeding crop by improving the tilth and increasing the supply of nitrates and other available plant food. For winter fallow, the land should receive a deep plowing in autumn. Exposure through the winter allows the frost to pulverize the surface. In the spring, when the weather becomes dry, the cultivator or the plow opens up the soil and destroys weeds. In many cases on poorer soils it is good practice to apply dung and similar organic manures to the fallow land.

Since the general introduction of green manuring crops, the term "fallow" has departed somewhat from its original meaning. These crops are sown on what was formerly the fallow and are styled fallow crops. This practice, known as green fallow, is especially applicable to light, poor soils. It protects the soil from washing and loss of nitrates by leaching, chokes out weeds, improves the tilth, and, if leguminous plants are grown, it enriches the soil in nitrogen gathered from the air by these plants, while some mineral matter is brought to the surface from the subsoil by the roots of the plants. (See GREEN MANURING.) In dry climates, however, green fallow land is likely to suffer from drought in autumn. In so-called "dry farming," practiced in regions of scanty rainfall, a grain crop is often grown only every second year, the land being kept in bare fallow and well stirred meanwhile to store and conserve moisture. Bastard fallowing is a term applied in Scotland to the practice of plowing hay stubble at the end of summer, freeing from weeds, and sowing with wheat in autumn. A similar practice, known

as short fallow in America, consists in plowing the soil immediately after removing a crop of grain, clover, etc., and keeping the soil well stirred until grain or grass is seeded in the fall. This treatment is very beneficial, and the period is so short that there is not much danger of loss of nitrogen by leaching. Consult: Roberts, *The Fertility of the Land* (New York, 1897); Storer, *Agriculture* (7th ed., ib., 1897); Hopkins, *Soil Fertility and Permanent Agriculture* (ib., 1910); Agee, *Crops and Methods for Soil Improvement* (ib., 1912).

FALLOW DEER (so called from the dun yellow color). A species of deer (*Dama platyceros*, or *vulgaris*) commonly kept in parks, in most parts of Europe. It is a native of the countries around the Mediterranean and has been introduced by man into the northern parts of Europe, where it has run wild in some places; it is also wild in Spain, Sardinia, and the Greek islands. How far its geographic range extends eastward is not certainly known. It is represented in the sculptures of Nineveh, but these engravings were probably copied from a different species, the Persian fallow deer (*Cervus mesopotamicus*). Its introduction into Great Britain has been ascribed to James VI of Scotland, but it is known to have existed long before his time in Windsor Park. Hundreds of fallow deer now inhabit some of the English parks, where they generally receive some attention and supplies of fodder in winter.

In size the fallow deer is smaller than the stag or red deer, from which it also differs in its broadly palmated antlers, about 25 inches long, its longer tail, and its smoother and finer hair. A large buck will weigh 180 to 200 pounds and stands between 36 and 40 inches at the shoulder. The record antlers are 29.5 inches in length, with a spread of 28.5, and possess 14 points. In color it is generally yellowish brown in summer, darker, or even blackish brown, in winter; more or less spotted with pale spots, particularly in summer, and when young. In one variety the spots are very marked; but in another (especially preserved in Epping Forest, near London) they are not to be observed even in the young. The under parts, inside of the limbs, and interior surface of the tail are white, and a dark line passes along the back. When the fallow deer and red deer are kept in the same park, the herds seldom mingle, nor do hybrids occur. The fallow deer loves the woods. Its flesh is one of the most esteemed kinds of venison. The remains of nearly allied fossil species occur in some parts of Europe. Compare **SKA**; and see **DEER**, and **Plate of FALLOW DEER, MUSK, ETC.**

FALLOWS, SAMUEL (1835-1922). An American educator and bishop of the Reformed Episcopal church. He was born at Pendleton, England, and went to America in 1848, graduated at the University of Wisconsin in 1859, was appointed professor and vice president of Galesville University, and entered the Methodist ministry. He served in the Civil War as chaplain, and in 1865 was breveted brigadier general of volunteers. From 1871 to 1874 he was State Superintendent of Public Instruction. He was president of Illinois Wesleyan University for a year, and in 1875, joining the Reformed Episcopal denomination, was made rector of St. Paul's, Chicago. In 1876 he was consecrated Bishop of the West and Northwest jurisdiction, and he was eight times Presiding Bishop of the General Council. He was chairman of the

general committee on education of the World's Congresses at the Chicago Columbian Exposition. For several years he edited the *Appeal*, the organ of the Reformed Episcopal church in the West. He was interested in lexicography and in psychotherapy. He wrote: *Complete Handbook of Abbreviations and Contractions* (1884); *Handbook of Briticisms, Americanisms, Colloquial Words and Phrases* (1883); *Dictionary of Synonyms and Antonyms* (1883-86); *Progressive Supplemental Dictionary of the English Language* (1886); *Student's Biblical Dictionary* (1901); *Story of the American Flag* (1903); *Science of Health* (1904); *Popular Critical Biblical Encyclopedia* (3 vols., 1904); *Christian Philosophy* (1905); *Memory Culture* (1905); *Health and Happiness* (1908).

FALL RIVER. An important manufacturing city and port of entry in Bristol Co., Mass., 50 miles south by west of Boston, at the mouth of the Taunton River, and on the east shore of Mount Hope Bay (Map: Massachusetts, E 6). It is on the New York, New Haven & Hartford Railroad, and is connected by electric railways with cities and towns in the vicinity. Fall River has a safe and deep harbor. The port is among the first 20 of the United States in imports, and is exceeded only by New York and Philadelphia on the Atlantic Coast in intercoastal trade through the Panama Canal. The well known Fall River Line runs boats from here to New York, and connection is had with Philadelphia by the Merchants & Miners Line from Providence through connecting steamers. The city is about 9 miles long, covers 42 square miles and has many fine structures of native granite. The most notable buildings are the B. M. C. Durfee High School, a gift to the city, the Technical High School, public library, State armory, customhouse and post office, Bradford Durfee Textile School and Bristol Co. Court House. There are two high schools, two junior high schools and other elementary public schools, also a large number of parochial schools. A large proportion of both public and parochial schools are in fine modern buildings, as is the Bradford Durfee Textile School (opened in 1904). Among the charitable institutions are the Boys' Club, City, Union, St. Anne's and Truesdale Hospitals, Children's Home, St. Vincent's and St. Joseph's orphanages and several day nurseries. Five public parks have been laid out in various parts of the city and several playgrounds, and there are beautiful drives to the suburbs.

Fall River is one of the greatest textile manufacturing centres of the United States and is noted chiefly for its manufactures of cotton goods, employing 35,000 operatives in more than 100 mills which have nearly 4,000,000 spindles and represent an invested capital of \$48,150,000. The largest fuel oil refinery in New England was erected here in 1922 having a capacity of a million barrels a month. Other manufactures include calico prints, bleaching, men's hats, yarn, thread, spools and bobbins, iron and brass foundry products, machinery, mops, rope and twine, etc. Granite quarrying is also an important industry which affords employment to a considerable number of men.

The government, under a charter granted in 1902, is vested in a mayor, chosen once in two years, and a board of aldermen consisting of 27 members. The school committee of nine members is chosen by popular election. The Mayor

appoints superintendents of streets and public buildings, and nominates water, park and fire commissioners, assessors, tree warden, trustees of library, auditor and solicitor. These are all subject to the confirmation of the board of aldermen. This body elects the city clerk, treasurer and collector. The police commission is appointed by the Governor of the State. The mayor makes up the annual budget, subject to the approval of the board, which can decrease, but not increase, his estimates. Fall River has an excellent system of sewers, is lighted by gas and electricity and owns its water works, constructed at a cost of \$2,000,000 which provides a never-failing supply of pure water from Watuppa Lake. The city receipts for 1924 were \$12,651,309, expenditures \$12,375,403. Fall River was the first city in the United States to adopt free text books in public schools. The city is noted for its law abiding character and general freedom from crime, especially among juveniles. Pop., 1850, 11,524; 1870, 26,766; 1890, 74,398; 1900, 104,863; 1910, 119,295; 1920, 120,485; 1925, 130,885.

Fall River was settled by grantees of the Plymouth Colony, along Mount Hope Bay upon land obtained by treaty with Massasoit, chief of the Wampanoags. Its inhabitants took a prominent part in the War of King Philip, and the territory long remained the hunting ground of the tribe. The village was included within the limits of Freetown until 1803, when it was incorporated as a separate town under its present name. It was called Troy from 1804 to 1834, when its old name was restored. In 1854 Fall River was chartered as a city, and 1862, on the readjustment of the Massachusetts-Rhode Island boundary, a part of the town of Tiverton, R. I. with a population of 3590, was annexed. On July 2, 1843, a disastrous fire destroyed 291 buildings and other property, a total loss of \$525,000. Consult Earl, *A Centennial History of Fall River* (New York 1877); Fenner, *History of Fall River* (1906); *History of Fall River*, compiled for the Cotton Centennial (1911); Hutt, *History of Bristol County* (1924).

FALLS CITY. A city and the county seat of Richardson Co., Neb., 102 miles south by east of Omaha, on the Missouri Pacific and the Chicago, Burlington and Quincy railroads (Map: Nebraska, J 4). It has railroad shops, grain elevators, a poultry-packing plant, a large brewery, and manufactures of flour, cider, and vinegar, cigars, stock powder, and cement. The city contains a public library and Catholic convent. The water works and electric-light plant are owned by the municipality. Pop., 1900, 3022; 1910, 3255.

FALMOUTH. A municipal borough and seaport of Cornwall, England, on a west branch of the estuary of the Fal, 66 miles west-southwest of Plymouth (Map: England, A 6). It consists chiefly of a narrow street, a mile long, on the southwest of the harbor, and of beautiful suburban terraces and villas on the heights behind. The harbor, one of the best in England, whose advantages were first exploited by Sir Walter Raleigh, is formed by the estuary of the Fal. It is defended on the west by Pendennis Castle and on the east by St. Mawes Castle, both built in the reign of Henry VIII. The entrance is about 1 mile broad. The docks of Falmouth have an area of over 100 acres. At one time an important port for the foreign mail

packets, the town is now chiefly known as a watering place, the bathing being excellent and the climate delightfully mild. A new pier, which cost \$60,000, was completed in 1905, and there have been other important improvements along the water front in recent years. The municipality maintains a fine park, given by the Earl of Kimberley, and also landing piers, bathing beaches, and a free library. It controls the oyster and mussel fisheries. Falmouth is a busy centre of the pilchard fishery and has an export and import trade of increasing volume and importance. It exports arms and ammunition, chemical products, tin, copper, and clay. Its chief imports are grain, manures, and timber. It is the seat of a United States consul. The scenery of the Fal, from Truro to Falmouth, is of great beauty. Pop., 1901, 11,789; 1911, 13,136.

FALMOUTH. A city and the county seat of Pendleton Co., Ky., 59 miles by rail north by east of Lexington, on the Licking River, and on the Louisville and Nashville Railroad (Map: Kentucky, F 2). It is in an agricultural and dairying region, with a trade in tobacco, grain, and live stock, and has flour, lumber, and woolen mills, tobacco warehouses, a distillery, cannery, etc. The water works and electric-light plant are owned by the municipality. Pop., 1900, 1134; 1910, 1180.

FALMOUTH. A town, including several villages in Barnstable Co., Mass., 16 miles (by water) east of New Bedford, on Vineyard Sound and Buzzard's Bay, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, F 6). It has a public library and is a popular summer resort. At Woods Hole, a village of Falmouth, the Marine Biological School is situated. Falmouth was settled in 1636 and incorporated in 1686. The town owns the water-works system. Pop., 1900, 3500; 1910, 3144.

FALSE ACA/CIA. See LOCUST TREE.

FALSE BAY. An inlet on the southwest end of Cape Colony, South Africa, situated between the capes of Good Hope and Hangklip. It is almost circular in shape and over 22 miles in diameter, and, being remarkably well sheltered by Table Mountain from the northwest winds, is used as a station for the British naval forces in South Africa.

FALSE DECRETALS. See PSEUDO-ISIDORIAN DECRETALS.

FALSE FLAX. See CAMELINA; GOLD OF PLEASURE.

FALSE IMPRISONMENT. The wrongful violation of the right of personal liberty by detention or restraint of a person without authority of law. While ordinarily it takes the form of confinement in a prison, jail, or police station, actual incarceration is not necessary to the offense. Nor is assault or personal violence. It may be committed by words or gestures operating upon the will of a person, so that his liberty of action is illegally limited. A man may be falsely imprisoned in an open street, as when he is accosted by an officer and told that he is a prisoner. But an illegal interference with his right of passage along a highway does not amount to false imprisonment if he is free to proceed by some other way. The victim of false imprisonment may regain his liberty by a writ of habeas corpus (q.v.) and is entitled to damages in an action in tort from the wrongdoer, who is also liable to criminal prosecution by *indictment*.

The defendant, in a civil or criminal action for false imprisonment, must (after the plaintiff has made out a *prima facie* case) prove either that the imprisonment was not his act or that it was justified. He must do more than prove that he did not apply the restraint; he must show that he did not direct, instigate, authorize, or adopt the proceedings connected with the imprisonment. All persons taking part in a false imprisonment, whether as instigators, officers, or agents, are liable as joint wrongdoers. A person is not liable for false imprisonment who does no more than make a complaint to a magistrate or a police officer, if the judge or the policeman thereupon takes independent action.

Whether a judicial officer is liable, civilly, for a false imprisonment which he has ordered, depends upon whether he has acted with or without jurisdiction. If he was absolutely without jurisdiction, he is liable; otherwise not, even though he may have acted maliciously. For the corrupt or malicious misconduct of an officer, when acting in a judicial capacity, the only punishment is impeachment or removal from office. An imprisonment by a sheriff, constable, policeman, or similar officer is justified: (1) when made under an apparently regular warrant issued by a judge having apparent jurisdiction of the matter; (2) when made without a judicial warrant, but upon reasonable suspicion of felony, even though a felony has not been committed, or of a person committing a breach of peace in the officer's presence. An imprisonment by a private citizen is justifiable at common law only when made of one committing a breach of the peace in his presence, or of one whom he has reasonable cause to believe guilty of a felony which has been actually committed. These rules of the common law have been modified by modern statutes in many jurisdictions. Consult Stephen, *History of the Criminal Law of England* (London, 1883), and the authorities referred to under TORT and MALICIOUS PROSECUTION.

FALSEN, fäl'sen, CHRISTIAN MAGNUS (1782-1830). A Norwegian statesman, jurist, and historian, son of Enevold de Falsen (1755-1808), a dramatist and author of a famous war song "Til vaaben." He was born at Oslo, near Christiania. In 1808 he became circuit judge at Follo, and after 1814 he played an important part in politics. He upheld King Christian Frederick, and after the separation of Norway from Denmark associated himself with J. G. Adler in drafting a constitution for Norway, which was modeled upon that adopted by France in 1791, and which was voted, May 17, 1814, by the Eidsvold, in which he and Sverdrup were leaders. In 1822 he was appointed Attorney-General of the Kingdom, and in that post, which he held for three years, lost much of his popularity with the Democratic party. In 1825 he became bailiff for Bergen, and in 1827 president of the Supreme Court. His principal work is *Norges Historie* (1823-24), a history of Norway to 1319 A.D. Consult the biographies by Daa (Christiania, 1860) and Vullum (ib., 1881).

FALSE POINT. A cape, harbor, and light-house in the Cuttack District of Bengal, India, on the Bay of Bengal (Map: India, E 4). The harbor is large but exposed, and loading can be carried on only in calm weather. It is a regular port of call for Anglo-Indian coasting steamers. There is a large export trade, chiefly in rice, with Ceylon, Mauritius, and other British colonies. It derives its name from fre-

quently being mistaken for Point Palmyras, to the north.

FALSE POSITION, RULE OF. An ancient mode of indirect reckoning, largely superseded by the direct method of equations. The simple equations found in the *Lilivati* of Bhaskara, in the *Libri Quadratorum* of Leonardo of Pisa (see FIBONACCI), and in the works of Tartaglia are solved by this assumption. Indeed, the method goes back to the ancient Chinese and Egyptian mathematicians. The method consisted in assuming any number for the unknown quantity, testing its ability to satisfy the given conditions, and finally correcting it by means of a simple proportion; e.g., What number is that whose half exceeds its third by 12? Assume 96 to be the number; $48 - 32 = 16$, which is too great; but $16 : 12 = 96 : 72$, hence 72 is the number.

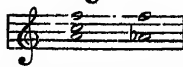

FALSE PRETENSES. In law, willful misrepresentations of fact, whereby a person is induced to part with money or other property to the person making the false statements or to another. By the common law of England a man is not punishable as a criminal who has induced another by fraudulent representations to part with money or goods, unless the loss occasioned by the deception be of a public nature. Larceny or theft was the only species of wrongful abstraction of articles of value which was recognized; and where the consent of the owner to the transaction was obtained, no matter how fraudulently, the loser was left to a civil action for deceit, or to an indictment for the crime of cheating. But neither of these remedies was of sufficient scope to cover all cases of the obtaining of money or other property by false pretenses, and accordingly a statute was passed in the thirty-third year of Henry VIII, whereby it was enacted that if any person should falsely and deceitfully obtain any money, goods, etc., by means of any false token or counterfeit letter made in any other man's name, the offender should suffer any punishment short of death, at the discretion of the judge. This statute, however, only reached the case of deception by use of a false writing or token; the Statute 30 Geo. II, c. 24, was therefore passed for the purpose of including all false pretenses whatsoever. Further alterations have been made by subsequent statutes. The general principle is that, wherever a person fraudulently represents as an *existing fact* that which is not an existing fact, and so obtains money or other property from the victim of the deception, he commits an offense within the act. A false representation as to the hopes or expectations of the person making them, as a deceitful calculation of anticipated profits, or the like, is not a violation of the law, however it may mislead the person to whom it is made. The provisions of the Statute of Geo. II have been substantially adopted in the legislation on this subject in our States. See CHEAT; FRAUD; LARCENY; and consult the authorities referred to under CRIMINAL LAW.

FALSE RELATION. In music, the discrepancy arising from the use in successive chords, but in different parts, of any given tone and one of its

chromatic derivatives. Thus,

is a false relation, but

is correct, since the given tone (a) and its chromatic derivative (ab) are in the same part.

FALSE SWEARING. See PERJURY.

FALSET, or **FALSETTO.** See VOICE.

FALSE TOPAZ. See QUARTZ.

FALSE VERDICT. See JURY.

FALSE WEIGHTS AND MEASURES. See WEIGHTS AND MEASURES.

FALSTAFF. An opera by Verdi (q.v.) first produced in Milan, Feb. 9, 1893; in the United States, Feb. 4, 1895 (New York).

FALSTAFF, fəl'stāf, SIR JOHN. A fat, cowardly, boastful character, unsurpassed in literature as a comic portrait. He is represented by Shakespeare in *The Merry Wives of Windsor* as the lover and dupe of Mistress Page; in *Henry IV* as a soldier and man of wit. It has been supposed that the character was intended to ridicule an English general, Sir John Pastolfe, who at Patay fled before Joan of Arc and was degraded in consequence. In the first draft of *Henry IV* Falstaff is called Sir John Oldcastle, the name of a prominent Wic-lifite, Lord Cobham, who was put to death under Henry V, the name being subsequently changed in deference to Oldcastle's descendants. The character has also been made the central figure of operas by Dittersdorf (1796), Salieri (1796), Balfe (1838), Nicolai (1849), Adam (1856), Verdi (1892), and others.

FALSTER, fəl'stēr. A Danish island in the Baltic Sea, lying to the south of Zealand, from which it is separated by Masned Sound, and east of Laaland, from which the narrow Guldborg Sound divides it (Map: Denmark, F 4). Area, 183 square miles. Its surface is flat, nowhere exceeding an altitude of 150 feet. It is very fruitful and well cultivated, though the low districts are swampy and unhealthy. The inhabitants are chiefly engaged in agriculture, stock farming, and dairying. Cultivation of the sugar beet is an important industry. The chief towns are Nykjøbing, on the Guldborg Sound, and Stubbekjøbing. Pop., 1901, 34,422; 1911, 37,460.

FALSTER, CHRISTIAN (1690-1752). A Danish poet and philologist, born at Branderslev (island of Laaland). He became rector of the school at Ribe in 1712, and, although offered better positions from time to time, refused to give up his rectorship, preferring to live there for his special studies. He published translations of *Ovid* (1719) and *Juvenal* (1731); 11 original satires on his times, often reprinted (1720-39); and in Latin a number of works, such as *Vigilia Prima Noctium Ripensium* (1721); *Memoria Obscura* (1722); *Amanitates Philologicae* (3 vols., 1721-32).

FALUN, fäl'ūn. A town of Sweden, in the Län of Kopparberg, situated on the Faluå near the north end of Lake Runn (Map: Sweden, F 6). The city consists of nine ancient villages, and is now regularly built, but is dirty, owing to the adjacent smelting works. The principal buildings are the Kopparbergs Kyrka—dating from the fourteenth century—with its green copper roof, a town hall, a museum, a gymnasium, and a mining school. To the southeast of the city are situated the famous copper mines of Falun, which were at one time classed among the richest in the world. The machinery is run by water power. Much attention is paid to the production of vitriol. Silver, sulphur, and gold are also obtained; manufactured products include linen, cotton goods, tablecloths, leather, and smoking pipes. Pop., 1900, 9600; 1910, 11,582; 1912, 11,955.

FAMA (Lat.). A personification of Rumor, by the Roman poets. Vergil gives a vivid description of Fama (*Æneid*, iv, 173 ff.), and Ovid describes her palace of bronze (*Metamorphoses*, xii, 39 ff.). See OSSA.

FAMAGUSTA, fā'mā-gō'stā, or **FAMA-GOSTA.** A seaport on the east coast of Cyprus. It has a fine mosque, formerly a Christian church, while to the north are the ruins of Salamis. Its harbor has been improved under English rule. Pop., 1901, 3825; including the adjacent village of Varashia, 5327. Famagusta was built by the Romans of the Empire, probably on the site of the ancient Arsinoë, and was called Fama Augusta. Under Byzantine rule it was an episcopal see and from the twelfth century was the richest city on the island. The Genoese and Venetians held it in turn, the latter building its strong fortifications. In 1517 it fell into the hands of Turkey.

FAMILIARITY (Lat. *familiaritas*, from *familiaris*, familiar, from *familia*, family, from *famulus*, OLat. *famul*, servant). The traditional view of the process of recognition (q.v.) is rather an expression of a logical postulate than of a psychological analysis of the data furnished by consciousness. It has been assumed that recognition is possible only when the given experience is compared with the memory image of its former occurrence (called forth according to the laws of the association of ideas), and the judgment, "this is like to that," has been passed. But in most of our recognitions this lengthy process of comparison is not performed. On the contrary, recognition is usually "immediate," i.e., the object is at once "felt" to be familiar or known, there being present no associative links to "mediate" the judgment. Admitting this immediacy of recognition, the analytical psychologist seeks to discover whether the "feeling of recognition," the sudden glow of familiarity, can be subjected to further analysis, and whether its physiological substrate can be ascertained.

Four views with regard to the essential nature of the processes involved in recognition may be distinguished. 1. Familiarity is a "form of combination," in which the various constituents are fused together in such a way as to form a new mental process, an unanalyzable "knownness." 2. Immediate recognition, though it shows no conscious trace of the processes of association and comparison, is yet in reality complex, because based upon a subliminal association, i.e., an association in which the secondary member is not represented in consciousness. 3. Mental images need not necessarily be present; the actual basis of familiarity is to be found, partly in the especial effectiveness of familiar impressions or memory images for central excitation, and partly in the characteristic mood which they ordinarily induce, and which includes both pleasurable affective processes and the corresponding organic sensations. 4. Lastly, it is held that the essential factor in recognition is a feeling, the "feeling of familiarity"; whenever this appears, we recognize; when it does not appear, we fail to recognize. The sensations and ideas which result from the associative and organic reaction to the stimulus then serve to make the recognition definite—to name, place, and date the experience.

The evidence of experiment favors the last of these views. As against the first, observers unite in agreeing that the feeling of familiarity is analyzable; as against the second and third

views, it has been shown that recognition is possible in the absence of any associated idea whatever, and that a perception may call up objectively correct associates and still not be recognized. It is more difficult to say whether the assumed organic complexes enter into the process of recognizing, because they must blend with the organic complexes comprised in the feeling of familiarity. So far as it goes, the evidence is also against them; recognition, as such, seems to be wholly a matter of the feeling. This feeling itself is variously reported as a glow of warmth, a sense of ownership, a feeling of intimacy, a sense of being at home, a feeling of ease, a comfortable feeling. It is a feeling in the narrower sense, i.e., a simple connection of affection and sensation in which the affective element predominates, pleasurable in its affective quality, diffusely organic in its sensory character. That is all that analysis can, at present, tell us about it. If we allow ourselves to speculate, we may go further and find a genetic sanction for its peculiar warmth and wide diffusion; we may suppose that it is a weakened survival of the emotion of relief, of fear unfulfilled. To an animal so defenseless as was primitive man, the strange must always have been cause for anxiety; "fear" is, by its etymology, the emotion of the "farer," of the traveler away from home. The bodily attitude which expresses recognition is, on this view, still the attitude of relief from tension, of ease and confidence. Consult: Baldwin, *Mental Development in the Child and the Race* (New York, 1906); Höfding, in *Vierteljahrsschrift für wissenschaftliche Philosophie*, vols. xiii, xiv (Leipzig, 1889-90); Külpe, *Outlines of Psychology* (London, 1909); Titchener, *Text-Book of Psychology* (New York, 1910).

FAMILIAR SPIRITS. Spirits supposed to attend certain individuals. See WITCHCRAFT.

FAMILYLISTS, FAMILY OF LOVE. See AGAPEMONE.

FAMILY (Lat. *familia*, family). The Romans used the word to denote personal property and, further, to denote the descendants of a common progenitor. In our use the word has this last meaning and also the more especial reference to the group—father, mother, and children. The prevailing idea has long been that the monogamic family was the original type, and that on this all society has been based, other forms being regarded as degenerate. This conception has been accepted since Aristotle, who wrote (*Politics*, i, 1) that the original family consisted of the husband and wife and the ox, which last is the slave of the poor man. This patriarchal family was the simplest and earliest form of government and became the model of the monarchy later, the sons with their families standing in coordinate relation to each other under the headship of the father. In Rome the idea of the family was closely connected with the state, and the inherent power of the father (*patria potestas*) was the basis of the social and political life. This conception of the family has been called in question in recent years by the investigations of Bachofen, McLennan, Morgan, and their followers. They find evidence that primitive man lived in a condition of promiscuity. Westernmarck, Maine, and others deny this. The question is not yet decided. Far too little is known of primitive conditions to make a decision possible. Investigations have shown, however, that among many nations the family,

in our sense of the word, can scarcely be said to have existed. Further, many historical nations have legends of the creation of the family. Among advanced nations are customs which seem to point to earlier conditions. The present indications are that monogamy must be considered as the highest form of the family the human race has yet attained. No people is definitely known to have lived entirely on a basis of promiscuity, though some have closely approached it. There are, however, at least three types of families which are distinct. The lowest of these is where the wife is at the head. (See MATRIARCHATE.) Polyandry is common, and descent is reckoned only through the mother. The father is frequently kept at a distance, and sometimes is not even regarded as a blood relative of his own children. A higher form is the patriarchal family, which is almost universally accompanied by polygamy. (See PATRIARCHATE.) This form has been widely extended and prevails to-day over large sections of the earth. The third form is monogamy.

The life of the monogamic family centres about the home, which has become a social and religious ideal. Under Christian influence the monogamic family attained a development and importance which it never enjoyed among pagan peoples. This development was gradual, as Christianity gained its footing among the converted nations. The spiritual emphasis which Christianity placed upon the connubial relations with the strict obligation of mutual fidelity contributed to this elevation of family life. The home has continued to gain in popular esteem. Its influence in elevating woman, in establishing chastity, in training children, in promoting religion, has given it deserved prominence. Modern charitable efforts seek to further home life. That the home is the best place for the child has become axiomatic. It is this conception of home which has given the modern family such superiority over all others. In industrial relations the family has been important. Until recent times it has been the unit of production. Though modern industrialism appears to have changed this, the agricultural pursuits remain in the hands of the family. The family has also been a unit of consumption. Economic changes have always had a great, if not a determining, effect upon the family. The change from rural to urban conditions has caused great disturbances, and the family is not yet adjusted to the new conditions. Consult: Letourneau, *Evolution of Marriage and of the Family* (New York, 1891); Westernmarck, *The History of Human Marriage* (London, 1894); Starcke, *The Primitive Family* (New York, 1899); Howard, *History of Matrimonial Institutions* (Chicago, 1904); Arbois de Jubainville, *La famille celtique* (Paris, 1905); Lévy, *La famille dans l'antiquité israélite* (ib., 1905); Parsons, *The Family* (New York, 1906); Bosanquet, *The Family* (London, 1906); Whetham, *The Family and the Nation* (ib., 1909); Dealey, *The Family in its Sociological Aspects* (Boston, 1912); Thwing, *The Family* (ib., 1913). See MARRIAGE.

FAMILY COMPACT (Fr. *pacte de famille*). The name given to two alliances between the French and Spanish branches of the house of Bourbon in 1733 and 1761, for mutual support against England. In the latter compact the Bourbons of Italy were included.

FAMINE (OF., Fr. *famine*, from Lat. *fames*, hunger). A general scarcity of food, due as a

rule to the failure of crops and marked by outbreaks of plague and an abnormal rate of mortality. In earlier history it seems to have played a larger part in the woes of mankind than at the present time, though it has not yet been wholly obliterated. The isolation of communities in the early days transformed a temporary local failure of crops into a serious famine. In earlier ages it was not infrequently the case that the inhabitants of one district were gorged with plenty, while those of the neighboring region were suffering from starvation. As time has progressed, famines have lost in intensity. This is due principally to the more efficient means of transportation, which permit the distribution of food with greater rapidity than in earlier days. America can now come by direct exportation of food, if need be, to the relief of suffering India. The diversification of industry has been another factor of importance in almost abolishing famines from the more highly developed countries. In such a system of diversified industry many interests are represented, and, while calamity may overtake one or two of them, it is not probable that all will be stricken at the same time. It is therefore only the poorer agricultural countries such as Ireland and India, and Eastern countries generally, where the population often depends upon a single staple crop, that have been visited by famines in the latter part of the nineteenth century.

FAMINTZIN, fā-inên'tsên, ANDREI SERGEYEVITCH (1835-). A Russian botanist. He was born at Sokolniki, studied at the University of St. Petersburg, and was appointed professor of botany there in 1872. He was one of the earliest investigators of the development of the embryos of seed plants. His account of the embryo of *Alisma* (1879), along with that by Hanstein (1870), has long been taken as typical of the monocotyledonous embryo. His writings, many of which appeared in the publications of the St. Petersburg Academy, include *Embryologische Studien* (1879), *Studies of Crystals and Crystallites* (1884), and *Uebersicht über die Leistungen auf dem Gebiet der Botanik in Russland* (1892-94).

FAN. A tribe in French Equatorial Africa, differing in color and other bodily characteristics from the true negroes, well known through the explorations of Du Chaillu. They number about 300,000 and have only recently intruded themselves into the Gabun-Ogowé region, pushing forward to the coast from the northeast. The Yaunde of German Kamerun are related to them, but the Mpongwe, with whom they are often confused, are not. They are coffee-colored, well built, tall and slim, and have rather thin lips, well-developed beard, and short skulls, the frontal bone protruding. Their language is said to belong to the great Bantu family. They are serious and intelligent and to be depended upon. Their cannibalism has been greatly exaggerated. In the northern part of their territory it is not practiced at all, in the central region only by way of devouring an enemy's flesh, and even in the south not to any great extent. Consult Tassmann, *Die Pangwe* (2 vols., Berlin, 1913-14).

FAN (from AS. *fann* and cognate with Lat. *vannus*, both from the same ultimate root as wind, winnow, and Lat. *ventus*, from which Fr. *éventail*). An instrument or machine for agitating the air to winnow grain, ventilate rooms, or cool the body. In the East the use of fans

is of remote antiquity. The Hebrews, Egyptians, Chinese, and the miscellaneous population of India, all used fans as far back as history reaches. At the present day it is customary, in the better classes of houses in India, to suspend a large species of fan, known as a punkah, from the ceiling and keep it in agitation with strings, pulled by servants, in order to give a degree of coolness to the air. Among the oldest notices of winnowing fans are those in the Scriptures. There the fan is always spoken of as an instrument for driving away chaff or for cleansing in a metaphorical sense; and such notices remind us of the simple processes of husbandry employed by a people little advanced in the arts. As can be seen from the collection of Egyptian antiquities in the British Museum, the fan as an article of taste and luxury is of quite as old date as the agricultural instrument. On one of the bas-reliefs Sennacherib is shown attended by ladies carrying feather fans. In the Boulak Museum there is a wooden fan handle with holes for feathers, dating from the seventeenth century B.C.

References to the feather fan are numerous in ancient Greek authors, and illustrations of it are common on vases. Roman authors refer to it as used to drive away flies, notably Martial, xiv, 67. The vestal virgins employed fans to quicken the sacrificial flame. In the liturgy of the early Christian Church two deacons stood beside the altar and with fans (*flabella*) of thin parchment or peacock feathers or fine linen kept flies away from the sacred vessels. Gradually the waving of the flabellum acquired a deeper meaning and was held to signify the wafting of divine influence upon the ceremony, the movements to and fro symbolizing the quivering of the wings of the seraphim. By the end of the sixteenth century this liturgical use of the fan had ceased, although large flabella of peacock's feathers are still carried at festivals in procession before the Pope, and to deacons of the Greek church at ordination a fan is delivered as the symbol of the sacred office.

The oldest existing Christian fan, and the most famous of the few of which we have any record during the Middle Ages, is preserved in the cathedral of Monza, near Milan. It dates from probably the sixth century, opens into a circle 10 inches in diameter, is made of purple vellum, has a Latin inscription on each side, and when touched by maidens who make pilgrimages to Monza for the purpose is believed to promote their marriage projects.

Flag-shaped fans were introduced into western Europe by the returning Crusaders and were much used in Italy. In the sixteenth century the Chinese folding fan arrived in Portugal from the Far East, and its development in the homes of European artists marks a new epoch.

Queen Elizabeth was especially fond of fans, both feather and folding, and examples of both appear in her numerous portraits. In her inventory of 1600 are no less than 27. In Italy was developed a regular code of the fan, according to which ladies were supposed to convey hints and signals to admirers and to rivals. The poets took it up, and Gay tells how Master Cupid planned the shape of the fan, converted his arrows into sticks, and from their barbed points, softened by love's flame, forged the pin. According to a Spanish version, the first fan was a wing that Cupid tore from the back of Zephyrus, with which to fan Psyche as she slept

upon her couch of roses. Even the Greeks placed the plumed fan in the hands of the love god, thus recognizing it as his peculiar sceptre. "Women," says the *Spectator*, "are armed with fans as men with swords,—and sometimes do more execution with them." "In Spain," writes Disraeli in his *Contarini Fleming*, "the fan speaks a particular language, and gallantry requires no other mode to express its most subtle conceits, or its most unreasonable demands, than this delicate machine."

In the seventeenth century the centre of the European manufacture of fans was Paris, where the frames were shaped out of wood or ivory and the decorations painted on thin but tough vellum. Many were exported to Spain, some painted in Spanish style, and some blank to be painted in Spain. A famous fan painter of the period was Rosalba Carriera, and the designs of Lebrun and Romanelli were in high favor. Fans from India were imported into both France and England. In the reign of Louis XV the importation of Indian and Chinese fans increased greatly, following the fashion that favored Oriental decorative art in all its forms. But the home manufacture from exquisitely carved mother-of-pearl and ivory, with painted scenes after Boucher, Watteau, and Lancret, continued important, and the fan styles of France were copied more or less closely in Italy, England, and Spain. For parchment, taffeta, satin, and plain silk were often substituted, and occasionally lace. The French Revolution put an end to elegance in fans as well as in most of the other decorative arts. The collection of fans in the Victoria and Albert Museum at South Kensington is of extraordinary importance, and the fan exhibition there in 1870 helped revive the industry not only in England but also on the Continent.

Bibliography. *Catalogue of the Loan Exhibition of Fans at South Kensington* (London, 1870); Blondel, *Histoire des éventails* (Paris, 1875); Salwey, *Fans of Japan* (London, 1894); Rhead, *History of the Fan* (ib., 1910).

FAN, or FANNING MILL. In agriculture, a machine employed to winnow grain. In passing through the machine the grain is rapidly agitated in sieves, and, falling through a strong current of air created by a rotary fan, the chaff is blown out, and the clean grain falls out through an opening beneath. Fans are operated by hand or other power. A fan is a constituent part of large modern threshing machines, the threshing and preliminary winnowing being thus accomplished in one operation. The fan superseded the old and slow process of winnowing, which consisted in throwing the grain into the air or pouring it from a height, while a current of wind, blowing across the threshing floor, carried away the chaff. It is said that a machine for winnowing grain was first made in Scotland, by Andrew Rodger, a farmer of Roxburghshire, in the year 1737. See **IMPLEMENTS, AGRICULTURAL**.

FANARIOTS. To the Greeks who assisted him in obtaining an entrance to Constantinople after his ships had been transported overland to the Golden Horn, Mohammed II granted the Fanar quarter of the city, on the Golden Horn adjoining the Blacherna. The district was so called from the lighthouse that stood on the promontory jutting from it into the Golden Horn. The district is described by Grosvenor

as "prosperous, cleanly, and well-kept," and Theophile Gautier says of it, "Hither has fled ancient Byzantium." Its Greek inhabitants, many of them descendants of the oldest and noblest Byzantine families, were known as Fanariots and came to be a special class in the Ottoman Empire, recruited by emigrants from different parts of the old Byzantine Empire. Subtle, insinuating, intriguing, they soon took advantage of the ignorance of the Turkish governors and made themselves politically indispensable to their rulers. They filled the offices of dragomans, secretaries, bankers, etc. Through their influence the lucrative office of dragoman of the fleet was called into existence, which gave them almost unlimited power in the islands of the Archipelago. From them were chosen, until the outbreak of the revolution in 1821, the hospodars of Wallachia and Moldavia, while in addition the disposal of most of the civil and military posts under the Turkish government was in their hands. In spite of their power, however, they never exhibited much patriotism; they were animated by the petty motives of a caste, and when the War of Liberation broke out among their countrymen, the part they took in it, though fairly important, was not what their station and their wealth should have contributed to the patriot cause. In the present altered state of affairs in Turkey they have no political influence. Consult: Tenent, *History of Modern Greece* (2 vols., London, 1845); Samuelson, *Roumania* (ib., 1882); Crusius, *Turrogracia*, pp. 91, 479 (*Basilea*, 1854); Eaton, *Survey*, etc., pp. 331 et seq. (London, 1798); Dallaway, *Constantinople, Ancient and Modern*, pp. 98 et seq. (ib., 1797); *Libre d'or de la noblesse Phanariote en Grece, en Roumanie, en Russie, et en Turquie, par un Phanariote* (Athens, 1892).

FAN-CHENG, fän'ch'ung', or **FAN-CHING**. A town in the Province of Hu-peh, China, situated on the Hankiang, 162 miles northwest of Hankow. With its twin city of Siangyang-fu across the river it forms an important commercial centre on account of its position on the trade routes between southern and northern China, and the commerce from the plains of Honan and the Hoang Ho basin. The population is estimated at 100,000.

FANCIULLA DEL WEST, fän'ché-ü'lä dël väst', L.A. ("The Girl of the Golden West.") An opera by Puccini (q.v.), first produced in New York, Dec. 10, 1910; in Italy, June 12, 1911 (Rome).

FAN CORAL. A flat, spreading coralline growth, usually one of the *Acyonaria* (q.v.).

FANDANGO, *Sp. pron.* fän-dän'gô (*Sp.*, from the African name). One of the three national dances of Spain, the others being the bolero (q.v.) and the seguidilla (q.v.). It is probably the oldest Spanish dance and the prototype of all the other forms. It is mentioned frequently in the literature of the sixteenth century, when it seems to have first attained a national importance. The time of the dance is $\frac{3}{4}$, but the figures are very lively, and the music is supplied by castanets in the hands of the performers, a man and a woman, and by a song which is accompanied on the guitar. Sometimes the music is stopped, whereupon the dancers also stop, and remain rigid until it is resumed. When one couple is tired, another immediately takes its place, and the music and the dance go on as before, with no interruption.

FANEUIL, fān'el or fūn'el, PETER (1700-43). An American merchant, born in New Rochelle, N. Y. The family removed to Boston shortly after his birth and there established an extensive mercantile business, of which in time he became the proprietor. In 1740 Peter Faneuil constructed Faneuil Hall (q.v.) at his own expense and presented it to the town. The building was completed in the fall of 1742, the first public use to which it was put being the memorial exercise to its donor, who died in May, 1743.

FANEUIL HALL, fān'el or fān'yel. A market house and public hall in Boston, Mass. The original building, begun in 1740 and completed in 1742, was erected by Peter Faneuil (q.v.) and presented by him to the town. It was almost completely destroyed in 1761 and in 1763 was rebuilt by the town. During and preceding the Revolution it was so frequently used for important political meetings that it became known as The Cradle of American Liberty. In 1805 it was enlarged to its present size, 80 by 100 feet, and an additional story was added. The hall contains some fine paintings, the most celebrated of which is "Webster Replying to Hayne," by Healy, and meetings are still held in it. The basement is still used as a market. Consult Brown, *Faneuil Hall and Market* (Boston, 1901). See Plate of BOSTON.

FANFARE (Fr., from Sp. *fanfarría*, brag, from OSp. *fanfa*, bluster; probably from Ar. *far-fār*, blustering, from *farfara*, to agitate). A trumpet signal which employs the tones of the triad and generally closes on the dominant. It is often used to introduce marches (*Tannhauser*, *Attila*, etc.). Famous fanfares are, that in Beethoven's *Fidelio* announcing the arrival of the Governor and ending on the tonic, and the more extended ones in Wagner's *Lohengrin*, *Tristan*, and *Meistersinger*.

FANNIN, JAMES W. (c.1800-36). An American soldier. He was born in Georgia, and removed to Texas in 1834. In the Texan War of Independence he raised a company known as the Brazos Volunteers, which formed part of General Austin's army. After the fall of the Alamo Fannin received orders from Houston to blow up the fort at Goliad and fall back to Victoria. He delayed his retreat for some time to hear from Captain King, whom he had sent out to collect the women and children of the neighborhood, and finally setting out 350 strong, was overtaken and attacked, on March 19, 1836, on the banks of Colorado Creek, by General Urrea and 1200 Mexican troops. After a two days' battle, in which the Mexicans lost between 300 and 400 in killed and wounded, and the Texans only about 70, Fannin surrendered, on the condition that his troops should be paroled. Instead of being freed, they were taken back to Goliad as prisoners, where, on March 27, in accordance with orders from Santa Anna, in the absence of General Urrea, they were all shot down in cold blood, with the exception of two surgeons, the women, and about 25 men who escaped after being fired on. Those put to death numbered 371 and included Lieutenant-Colonel Ward's men.

FANNING, EDMUND (1737-1818). An American soldier, known as a partisan leader on the side of the Loyalists during the Revolutionary War. He was born on Long Island, N. Y., graduated at Yale in 1757, and soon afterward removed to Hillsboro, N. C., where he

practiced law, held various positions of minor importance, and was elected to the Legislature of the Colony. As recorder of deeds for Orange County, he made himself exceedingly unpopular with the colonists, and was charged with having, by his abuses and his vicious administration, done much to cause the uprising of the Regulators, who virtually drove him from North Carolina. He acted for a time as private secretary to his father-in-law, Governor Tryon (q.v.), in New York, and in 1774 was appointed surveyor-general by the British government. In 1777 he organized in New York a corps of 460 Loyalists, which, under the name "Associated Loyalists" or the "King's American Regiment," took an active part in the partisan warfare in the Northern Department. A short time before the close of the war he fled to Nova Scotia, where in 1783 he became a councillor and Lieutenant Governor, and subsequently was Governor of Prince Edward Island from 1786 to 1805. By successive promotions he became a lieutenant general in the British army in 1799 and a general in 1808. He moved to London in 1814-15, where he lived till his death.

FANNING, JOHN THOMAS (1837-1911). An American civil and hydraulic engineer. He was born at Norwich, Conn., was educated in public and normal schools, studied engineering and architecture, and had begun to practice engineering in his native town when the Civil War broke out. He enlisted and attained the rank of lieutenant colonel. At the close of the war he resumed engineering practice in Norwich and soon began to specialize in hydraulics. During the next 10 years he was engineer for a number of municipal water works in New England. In 1877 he published *A Treatise on Hydraulic and Water Supply Engineering* which, as the first and for many years the leading American work on that subject, went through many editions and gave the author much prestige. At that time less than 500 cities in the United States had water works. He was subsequently employed as consulting engineer for many water-works plants, municipal and private. In 1885 he made a report on the improvement of water power on the Mississippi River at Minneapolis, Minn., and in the following year he was appointed chief engineer of the St. Anthony Falls Water-Power Company in that city, where he lived until his death. He prepared a comprehensive plan for the drainage of 3000 square miles of the hard-wheat land in the valley of the Red River of the North; was consulting engineer for many large water-power projects, among which were early plants on the Missouri River, at Great Falls and Helena, Mont., and on the Spokane River, at Spokane, Wash.; and was also associated as consulting engineer with several of the leading railroad companies of the West. A notable trait of Mr. Fanning's character was the friendly advice and assistance which he rendered to his fellow engineers throughout his long professional career. He was for 38 years a member, and in 1910-11 a vice president, of the American Society of Civil Engineers and contributed largely to its *Transactions*, but as a writer he was best known for the pioneer American treatise already mentioned.

FANNING ISLANDS (named from Edmund Fanning, who discovered the islands in 1798). A group of small islands in the Pacific, scattered

about a segment of the equator, lying between long. 157° and 163° W. (Map: World, Western Hemisphere, J 5). The area of the group is about 260 square miles, and the chief islands are Christmas, Fanning, Jarvis, Washington, and Palmyra. Since 1888 they have belonged to Great Britain, but to Palmyra Island former Hawaiian now American claims have not yet been extinguished. Pop. (est.), 200.

FANNIUS STRABO, GAIUS. A Roman historian and orator, introduced by Cicero as one of the speakers in his works *De Amicitia* and *De Republica*. He was a son-in-law of Lælius. During the third Punic War he served in Africa under Scipio Africanus (149-146 B.C.), and, according to his own statement, as preserved by Plutarch (*Tib. Gracch.*, 4), was one of the first to mount the walls of Carthage in the capture of that city. He fought in Spain in 142-141 and was consul in 122. He owed his celebrity in literature chiefly to his *History*, which treated contemporary events and was one of the earliest histories written in Latin; it was long famous for its style and its impartiality. Cicero mentions an abridgment of it by M. Brutus. For the extant fragments, consult: Peter, *Historicorum Romanorum Reliquiae*, vol. i (Leipzig, 1870), and *Historicorum Romanorum Fragmenta* (ib., 1883); Gerlach, *Geschichtsschreiber der Römer* (Stuttgart, 1855); Hirschfeld, "Die Annales des Cicero Fannius," in *Wiener Studien* (Vienna, 1879); Schanz, *Geschichte der römischen Literatur*, vol. i, § 71, 6 (3d ed., Munich, 1907). This Fannius is frequently confounded with C. Fannius Strabo, who was consul in 122 B.C.

FANO, fā'nò (Lat. *Fanum Fortunæ*, from the temple of Fortune erected here by the Romans to commemorate the defeat of Hasdrubal, q.v.). An episcopal city in the Province of Pesaro and Urbino, Italy, on the Adriatic, 29 miles northwest of Ancona (Map: Italy, H 4). A modern statue of Fortune on the public fountain indicates the origin of the name. The once famous harbor is now choked with mud and sand, and the shipping is conducted through a canal leading from the Metauro to the Adriatic. The cathedral of San Fortunato has a thirteenth-century portal, a chapel with frescoes by Domenichino, and a Madonna with two saints by Carracci. In other churches are an enthroned Madonna (1497) by Perugino; a Madonna by Giovanni Santi, father of Raphael; an Annunciation by Guido Reni; frescoes by Viviani; and "Sant' Angelo Custode," by Guercino, which is the subject of Robert Browning's "The Guardian Angel." The Arch of Augustus has a second story, added during the fourth century in honor of Constantine. Fano has a lyceum, a gymnasium, an orphan asylum, an industrial school, and a once famous theatre, and is a centre of silk and fishing industries; makes oil and hemp goods. Sea bathing is excellent. Clement VIII was born here in 1536, and in 1514 the first printing press with Arabic type was set up here at the cost of Julius II. Pop., 1901 (commune), 24,848; 1911, 26,928.

FAN PALM. A loose term applied to certain species of palm, distinguished from the pinnate-leaved species, such as the date (*Phoenix*), by having fanlike leaves. Among the commoner fan palms are various species of *Corypha*, *Chamærops*, *Sabal*, and *Trachycarpus*. See Plate of PALMETTOS.

FANSAGA, fân-să'gi, COSIMO (1591-1678).

An Italian architect, painter, and sculptor, born at Bergamo. He was the pupil of Pietro Bernini in Rome and lived chiefly in Naples. His numerous works in that city include the fountain of Medina, the cloister and refectory of San Severino, the façade of Santa Teresa delli Scalzi and of St. Francis Xavier, the church of Santa Maria Maggiore, and the Maddaloni Palace, now the Banca Nazionale. Many of these were decorated with paintings and sculptures by his own hand. Despite their overloading of ornament and bizarre combinations, his works are usually effective.

FAN'SHAWE. A novel by Nathaniel Hawthorne, the author's maiden effort, published anonymously in 1826 at his own expense.

FANSHAWE, SIR RICHARD (1608-66). An English diplomat and author, born in Hertfordshire. He entered Jesus College, Cambridge, and in 1626 began the study of law in the Inner Temple. He spent several years upon the Continent and in 1635 began his diplomatic career, accompanying Lord Aston, the English Ambassador, to Spain as his secretary. He was a zealous Royalist and joined the army of Charles I early in the Civil War. In 1648 he became treasurer of the navy under Prince Rupert and afterward joined Prince Charles in Holland. He was special envoy to the King of Spain in 1650, for the purpose of obtaining pecuniary aid for the royal cause, but his mission was unsuccessful. He followed Prince Charles to Scotland as his secretary and was taken prisoner at the battle of Worcester (Sept. 3, 1651). He was released on parole and remained in England until 1658, when he again joined Charles II on the Continent, returning with him at the Restoration. In 1662 he was made Minister to Portugal and in 1663 was transferred to Madrid, where he died soon after he had been recalled in 1666.

The literary work of Fanshawe consists largely of translations and poetry. Probably his best-known work is *The Pastor Fido* (1647), a translation from the Italian of Guarini. His other translations include Vergil's *Æneid*, book iv, in Spenserian stanzas; *Selected Parts of Horace* (1652); *The Lusiad* (1665), in ottava rima, from the Portuguese of Camoëns; *La Fida Pastora* (1658), Latin verse from Fletcher's *Faithful Shepherdess*; and *Querer por solo querer* ("To Love only for Love's Sake," 1670), and *Fiestas de Aranjuez* (1671), comedies from the Spanish of Antonio de Mendoza. He wrote some original English poems of considerable merit, which have never been published together. His *Letters* were collected and published in 1724. Consult the *Memoirs of Lady Fanshawe* (London, 1907, ed. by H. C. Fanshawe), née Anne Harrison, whom he married in 1644 and who lived until 1680.

FAN SHELL. A scallop (*Pecten*); so called from its shape and radiating ridges.

FAN'TAIL. 1. A breed of domestic doves. See PIGEON, and Plate of PIGEONS. 2. One of the small flycatchers of India and Australasia, of the genus *Rhipidura*. These have long tails of loose feathers, which they "fan out" prettily by a sidewise flitting movement as they dodge about in pursuit of insects. They are familiars of every rural garden, sing much at night, and build exquisite nests. Some 50 species are known, scattered from New Zealand to the Himalayas. 3. A warbler (*Oisticola sahacnicola*) of the Mediterranean basin, remarkable for the

beautiful nest it builds in the form of a basket attached to upright stalks of grass, and filled with a cup of cottony material, and for the great variety in the coloring of its eggs.

The term "fan-tailed" has been used by systemists as a name for all birds except *Archæopteryx*, i.e., the Euornithes (q.v.), because the concentration of the caudal vertebra into a pygostyle gives the tail feathers a typically fanlike shape; hence Dr. Theodore Gill's term *Eurhipidura*, as an equivalent of Euornithes.

FAN'TAN (Chinese *fan*, number of times + *tan*, apportion). A gambling game, very popular in China. In the American game a pack of 52 cards is used. The deal starts by cutting the cards. Ace high deals. The cards are then dealt to the left, one at a time. As many as eight persons may play. The cards remaining at the finish of the deal are dealt face down to the centre of the table. The first player at the left of the dealer must have an ace to play, in which event he plays the ace to the centre of the table. Having no ace, he must ante the amount agreed upon (usually 5 cents or less) to the centre of the table and draw one of the remaining cards. Thus the game proceeds until an ace can be played, after which the different stacks of cards are built up consecutively to the king. The first player ridding himself of his cards wins the pot. Failure to play a card in turn is punished by a fine equal to the amount of the ante for every card remaining in all of the players' hands.

In China cards are not used, the game being played on a table on which is marked a square whose sides are numbered from one to four, or by means of a square piece of metal similarly inscribed. An unknown quantity of small coins are placed within this square and covered with a bowl. The players play their stakes against any side of the square, whereupon the banker uncovers the coins and removes them, four at a time. The player wins who has backed the number corresponding to the number of coins, from four down, which are left when the remainder have been removed, and receives five times the amount of his stake, less the banker's commission.

FANTASIA, *It. pron. fân'tâ-zâ'a* (It., fancy). 1. In music, a composition somewhat free in form, as opposed to the strict form of the fugue or sonata. 2. An improvisation (q.v.). 3. The fantasia, also free fantasia, that part of a movement in sonata form which follows the first, or exposition, section. It is also called "development section," because the themes used in the first section are here more fully developed. (See *SONATA*.) 4. In the seventeenth and eighteenth centuries the term "fantasia" was applied to a composition in which a theme was developed in free imitation (q.v.).

FANTI, or **FANTEE**, fân-tê' or fân-tâ. Formerly a separate African state, of about 20,000 square miles, now a part of the British Gold Coast Colony, situated on the coast south of Ashanti. The Fantis, who are closely allied to the Ashantis, waged incessant wars against the latter until subjugated in the beginning of the nineteenth century. See *ASHANTI*.

FANTI, fân'tê, **MANFREDO** (1808-65). An Italian general. He was born at Carpi, near Modena. In 1831 he was condemned to death for his part in the rising against the Duke of Modena, but he escaped to France; in 1833 he was with Mazzini in the attempted invasion of

Savoy. During 1835-48 he fought in Spain and distinguished himself in the Carlist War and was promoted to the rank of colonel on the general staff at Madrid. In Italy in 1849 he fought against the Austrians. During the Crimean War he served as general of a division, and in the War of 1859 commanded the forces of the provisional governments of Tuscany, Modena, the Romagna, and Parma. In 1860-61, as Minister of War and Marine, he increased the army and brilliantly conducted the campaign against the papal troops in Umbria. As chief of general staff to Victor Emmanuel, he reduced Gaeta and Mola. In 1872 a bronze statue was erected to his memory in Florence. Consult the biography (Florence, 1906) by Di Giorgio.

FANTINE, fân'tên'. The mother of Cosette, in Victor Hugo's *Les Misérables*. She gives her name to part i of the novel.

FANTIN-LATOURE, fân'tân' látôor', **HENRI** (IGNACE HENRI JEAN THÉODORE) (1836-1904). A French portrait painter and lithographer. He was born at Grenoble Jan. 14, 1836, the son of Theodore Fantin-Latour (1805-75). He studied first with his father, then in Paris under Lecoq de Boisbaudran, and later for a short time with Courbet. Although he frequently exhibited at the Salon, he is usually identified with the artists opposed to academic tradition, and was represented at the famous Salon des Refusés in 1863 with Manet, Whistler, and others. Fantin-Latour is best known for his portraits and portrait groups, simply but directly treated and of sober but delicate and luminous color. Among his best portraits are those of Manet at the Art Institute, Chicago; "A Lady," in the Metropolitan Museum, New York; Edwin Edwards and his wife, in the National Gallery, London; and Madame Fantin-Latour, Luxembourg Museum. His groups have a rare, almost puritanic charm, and are pervaded by a tender, intimate note. The most celebrated are "An Atelier in the Batignolles," including portraits of Zola, Monet, Manet, and other painters (Luxembourg); "Around the Piano," with portraits of celebrated musicians; and "Homage to Delacroix" with Whistler, Champfleury, and others (Louvre). He excelled in pastel and during his later years in lithography. Some of his lithographs were delicate portraits; others imaginary and fantastically romantic compositions illustrative of the operas of Wagner, whom he ardently admired, or interpretations of Beethoven, Berlioz, Schumann, and other musicians. A complete collection of his lithographs is in the Louvre; others are in the British Museum and the Dresden Gallery. Fantin-Latour also painted flowers with exquisite art, his best pieces being in England, where he lived for some time. He received many medals and was an officer of the Legion of Honor. He died Aug. 28, 1904. For his biography, consult Jullien (Paris, 1909); for a catalogue of his lithographs, Hédiard, *Les maîtres de la lithographie* (ib., 1898-99); for reproductions, *L'Œuvre lithographique de Fantin-Latour* (ib., 1907).

FANUM FORTUNÆ. See *FANO*.

FAN VAULTING. A kind of late Gothic vaulting peculiar to the Perpendicular (q.v.) style in England, called also "fan-tracery vaulting." It was the final, logically developed decorative outcome of the English practice of multiplying the structural ribs of a Gothic vault. In order to avoid the twisted surfaces incident

to the French vault system, which employed only three pairs of ribs (see VAULTING), the English early introduced intermediate *tierceron* ribs, as at Lincoln and much later at Exeter, by which the four triangular vaulting compartments of a bay were divided into a number of much narrower triangular surfaces, which could be independently laid up. When these ribs were given approximately the same curvature, the vaulting masses on each side in each bay became approximately semicircular in horizontal section, while the multiplying of the ribs greatly enhanced the decorative effect of the vaulting. The addition of subordinate bridging ribs (*liernes*, q.v.) was purely for decorative effect, producing star patterns, net patterns, etc. (Canterbury, Winchester, Tewkesbury, Gloucester, etc., 1368-1400). This led to the design and construction of vaults in which the ribs were treated more and more as mere decoration, and the concave-conoid form of the vault masses was emphasized. From about 1450 on, these masses were built up in semicircular horizontal courses, till they touched at the ridges, and the visible surfaces were adorned with paneling in relief—the decorative reminiscence of the structural ribs—forming fanlike patterns of great elegance. Long stone pendants were introduced, from which subordinate conoids were sprung, each with its fanlike paneling. The steps of this development may be traced from the chapter-house vaults (Westminster, Salisbury, Wells, etc., 1260-82) through such examples as the vaults of the retrochoir of Peterborough, the Divinity School at Oxford, the chapels of St. George at Windsor and of King's College at Cambridge, to the superb, florid, and final example in Henry VII's Chapel at Westminster (1509). See VAULTING; and consult Willis, "Construction of the Vaults of the Middle Ages," in *Transactions of the Royal Institute of British Architects* (London, 1842), and Bond, *English Church Architecture* (ib., 1913).

FA PRESTO. See GIORANO, L.

FARABI, fa-rā'bē. See AL-FARABI.

FARABI, fa-rā'bē, ABU NASR MOHAMMED IBN TARKHAN IBN UZLAJ AL (c.870-950 A.D.). One of the earliest of Moslem philosophers, called "The Second Master," the first being Aristotle. He was born of Turkish stock at Farab in Turkestan, but proceeded to Bagdad, where he devoted himself to the study of medicine, mathematics, and philosophy. From Bagdad he went to Aleppo, where, except for his close relations to Saif al Daula (q.v.), the ruler of this city, he lived a life of scholastic retirement. He died in Damascus, while on a visit to that place in company with Saif al Daula. Although a prolific writer, who occupied himself with philosophy, medicine, natural science, mathematics, and music, Farabi never worked out a system of philosophy. He was largely influenced by Aristotle, but also acquainted with Platonic and Neoplatonic thought. He was distinguished by the lucidity of his reasoning and the excellence of his style, but such was the fame acquired by his successor Avicenna (q.v.) that Farabi was for a long time almost entirely eclipsed, and his importance has been fully realized only in recent times. Dieterici, who made a profound study of his philosophy and translated many of his works into German, called special attention to his socio-political views. His *Madina al faṭila*, or 'Model State,' has been designated as a Utopia (q.v.) because

it describes ideal relations; yet it is not a romance of the future, but a sober discussion of the proper forms of social life. Among his writings was also an encyclopædia of the sciences. Consult: *Alfarabii vetustissimi Aristotelis interpretis opera omnia* (Paris, 1638); Schmolder, Arabic text and Latin translation of two dissertations, in *Documenta Philosophiæ Arabum* (Bonn, 1836); Steinschneider, *Alfarabi's des arabischen Philosophen Leben und Schriften* (St. Petersburg, 1869); Dieterici, *Alfarabis philosophische Abhandlungen* (Leyden, 1890); id., Ger. trans. of this work (ib., 1892); id., *Alfarabis Abhandlung der Musterstaat* (ib., 1895); id., *Der Musterstaat von Alfarabi aus dem Arabischen übertragen* (ib., 1900); Brockelmann, *Geschichte der arabischen Litteratur*, i, 210 ff. (Weimar, 1898); Nicholson, *A Literary History of the Arabs* (Cambridge, 1907).

FAR/AD. The farad is the so-called "practical" unit of electric capacity, being by definition the capacity of a condenser whose potential is one volt when charged by one coulomb. It is substantially equal to the C. G. S. electromagnetic unit of capacity, divided by 10^9 , or to the C. G. S. electrostatic unit of capacity, multiplied by 9×10^{11} . One-millionth of a farad is called a "microfarad." The name "farad" was given the unit of capacity in honor of Michael Faraday, who made such important discoveries in regard to the nature of the capacity of condensers. See ELECTRICAL UNITS.

FAR/ADAY, MICHAEL (1791-1867). A distinguished English chemist and physicist. He was born near London, the son of a blacksmith, and at an early age was apprenticed to a bookbinder. He devoted his leisure time to science and, among other things, made experiments with an electrical machine of his own construction. In 1812 he was able to attend four chemical lectures of Sir H. Davy (q.v.), then at the zenith of his fame, and he ventured to send to Davy the notes he had taken, with a modest expression of his desire to be employed in some intellectual pursuit. Davy engaged him as his assistant at the Royal Institution, and later took him to the Continent as assistant and amanuensis. On their return to London Davy confided to him the performance of a number of important experiments, which led in his hands to the liquefaction of certain gases by pressure. Here he showed that extraordinary power and ingenuity which resulted in so many important discoveries and rendered his name familiar to every student of physics. In 1824 he was elected to the Royal Society and in the following year was appointed director of the laboratory of the Royal Institution, where later he was promoted to Davy's post of professor of chemistry. Faraday's first important discovery was the revolution of a magnetic needle around an electric current (1821), and 10 years later came his work on magneto-electricity and induction. Following this came the discovery of the action of one current on another, when the deflection was observed as before, and also when a magnet was inserted or withdrawn in a coil of wire. These discoveries naturally furnished the foundation for the development of magneto and dynamo machines and other inventions of importance. Faraday's researches in electrolysis are also of great value, and to him is due the discovery that the amount of liquid decomposed is proportioned to the current passing through

MICHAEL FARADAY
FROM A PAINTING BY JOHN PHILLIPS

the solution, and that equal quantities of electricity decompose equivalent amounts of different electrolytes. To him we owe the terms "anode" and "cathode." He was also the discoverer of "specific inductive capacity," or the measure of the electric attraction and repulsion exerted through various dielectrics or insulating substances. According to Faraday, both electrostatic and electromagnetic induction takes place along curved lines, which he dominated "lines of force." Faraday discovered that the plane of vibration of a beam of polarized light is rotated under the influence of a powerful magnetic field. The phenomena of diamagnetism, or the repulsion of certain substances, were also carefully investigated by Faraday, and many valuable results obtained. In chemistry, also, where most of Faraday's early work was done, many important discoveries are to be recorded, including a number of new chemical compounds. Of these perhaps the most important is an investigation on new compounds of carbon and hydrogen (*Philosophical Transactions*, 1825), inasmuch as it included the discovery of benzol, which is the basis of aniline dyes. He also carried on a number of experiments looking to the production of optical glass with unusual power of refraction; but while glass with an index of refraction of 1.866 was made, it did not prove available, on account of its softness.

Faraday was one of the most brilliant experimentalists that science has ever known, and to him credit must be given for much that electricity has accomplished. The experimental work that he had done with such care furnished a basis for the mathematical and theoretical discussions of Maxwell, and his *Experimental Researches in Electricity* (1839-55) contains a complete record of his investigations. In 1835 Faraday received a pension of £300 a year for the rest of his life, and in 1836 he became the scientific adviser of Trinity House. By royal grant he occupied a house at Hampton Court. He was invited to become the president of the Royal Society, but declined the honor.

Faraday was a deeply religious man, belonging to a small sect of Christians known as Sandemanians, and was generous and sympathetic to a high degree. His last years were marked by failing powers of mind and body, yet in spite of this some of his best work was accomplished shortly before his death. In addition to the *Experimental Researches in Electricity* (1839-55), he published *Researches in Chemistry and Physics* (1859), and many papers in the *Proceedings of the Royal Institution* and the *Philosophical Magazine*. For his life and work, consult: Jones, *Life and Letters of Faraday* (London, 1870); Tyndall, *Faraday as a Discoverer* (2d ed., ib., 1870); Thompson, *Michael Faraday: His Life and Work* (ib., 1888).

FARADAY EFFECT. See ELECTRICITY; LIGHT.

FARADAY TUBES. See ELECTRICITY.

FARADISM. See ELECTRICITY, MEDICAL USES OF.

FARALLON (fär'-á-lón) ISLANDS, or THE FARALLONES. A group of seven small, rocky islands and several islets off the coast of California, about 30 miles directly west of San Francisco and a part of that city (Map: California, B 5). Their extreme points—northwest and southeast—are about seven miles apart. On the southernmost island stands an important

lighthouse, in 37° 41' 58" N., 123° 04" W., having a flashing light of the first order, 358 feet above the sea and visible 26 miles, and also a steam siren. The Farallones are the resort of myriads of sea gulls and murre, and in 1909 the islands were created a Federal bird reservation, thereby assuring the full protection of these birds for all time. Great numbers of sea lions and rabbits are also found. The rainfall is heavy, amounting yearly to 18 or 19 inches.

FARANDOLE. A national Provençal dance of moderate movement in 3/4 time. It has been used by Gounod in his *Mireille* and by Bizet in his suite *L'Arlesienne*.

FARCE (Fr. *farce*, from Lat. *farsus*, p.p. of *farcire*, to stuff). A dramatic piece intended to excite laughter by exaggeration and extravagance rather than by the truthful delineation of life. It differs from comedy mainly in the emphasis placed on plot. In farce the characters are what they are because the working of the plot requires them to be this and not something else, while in comedy the plot is subordinated to the characters. Broadly speaking, farcical elements have entered into many of the forms of primitive comedy. Thus, both in the significance of the word and the kind of "stuffing" it denotes, farce would seem to bear an analogy to the early Latin *satura*, while the popular *commedia dell'arte* of a much later day in Italy were of a somewhat similar character. The name *farce*, however, seems to have been first applied in its present sense particularly to the pieces produced by the French society of the *clercs de bazouche* as a contrast to the *moralities* played by the religious orders. They have been confounded in their origin with the *sermons joyeux*, or parodies on the ritual of the church. A characteristic of many of the farces was a mixture of dialects. In one scene of the *Farce de Pathelin*, the principal personage speaks seven or eight. This most famous of all the farces has been attributed to different authors, most commonly to Pierre Blanchet, one of the *Bazoche* in the fifteenth century, and even to the poet Villon. At a later date Molière elevated and refined mediæval farce into pure comedy in his *Médecin malgré lui*, *Les précieuses ridicules*, and other inimitable productions. In England the farce came, about the beginning of the eighteenth century, to be regarded as something distinct from comedy proper and to constitute a special form of composition. Out of the numerous farces which have been performed before English-speaking audiences, those of Samuel Foote especially have kept a place in literature. On the stage at the present day the name "farce," or sometimes the vulgarity "farce comedy," is freely applied to almost any light piece in which the comic goes to preposterous lengths. Consult: Petit de Julleville, *La comédie et les mœurs en France au moyen âge* (Paris, 1886), and *Répertoire du théâtre comique en France au moyen âge* (ib., 1886); Inchbald, *A Collection of Farces and Other Afterpieces* (London, 1815).

FARCY. See GLANDERS.

FARDEL-BOUND (OF. *fardel*, burden, Sp., Portug. *fardel*, diminutive of *fardo*, pack, from Ar. *fardat*, bundle of merchandise + *hound*). A form of indigestion in cattle, sheep, and goats, characterized by impaction of the fardel bag, or third stomach, with food, which is taken in between the leaves of this globular stomach, there to be fully softened and reduced. While it

may seem to be a primary disease, in very many cases it occurs as a result of some acute febrile or inflammatory affection. When the food is unusually tough, dry, or indigestible, consisting, e.g., of over-ripe clover, vetch, or rye grass, the stomach cannot moisten and reduce it with sufficient rapidity; fresh quantities continue to be taken in, until the overgoiged organ becomes paralyzed, its secretions dried up, and its leaves affected with chronic inflammation. The slighter cases, so common among stalled cattle, are "loss of cud," indigestion, and torpidity of the bowels. In severer form there are also fever, grunting, bloating of the first stomach, and sometimes stupor or epilepsy. The overgorged stomach can, moreover, be felt by pressing the closed fist upward and backward underneath the false ribs on the right side. The symptoms often extend over 10 days or a fortnight. Purgatives and stimulants are to be given. Consult J. Law, *Text-Book of Veterinary Medicine*, vol. ii (Ithaca, 1905-11).

FAR EASTERN QUESTION. The term originally applied to problems arising out of the participation of non-Asiatic nations in Asiatic awakening and development; more specifically it covers the claims, rights, and interests of certain Western powers, and (since 1894) of Japan, to what are styled "spheres of influence" in China; as, e.g., British interests along the Yang-tse valley and in Tibet; Russia's interests in Mongolia and Manchuria; Japan's sovereignty over Korea and her ceded privileges in Manchuria; French interests in Indo-China; Germany's lease of Kiaochow and her growing commercial and industrial investments in Shantung; and Portugal's possession of Macao.

In opposition to these rival territorial claims and claimants is the policy maintained by successive United States governments since it was first enunciated by Anson Burlingame in 1868, defending the rights of China to "eminent domain over her own territory," and protection against partition by land-hungry nations. This policy was more clearly defined by the late John Hay during the diplomatic discussions which arose over the Boxer troubles in 1900, in what has since been known as the "Open Door" declarations. Certain stipulations, reluctantly accorded by some of the rival powers, guaranteed, as a result of the good offices of the United States, the "administrative entity" of China.

While succeeding events led to certain deviations from this policy, materially it remains unaltered; and it was more recently amplified by what have been called the "Hands Off" pronouncements made by President Wilson and Secretary of State Bryan (1912-14). The policy conceived by the United States, through Burlingame, was to conserve China's integrity, pending her development along western lines; Hay's "Open Door" policy was to guarantee this integrity while fostering China's development through closer commercial communion and the extension of ports opened under foreign treaties with China; and the "Hands Off" policy aims to prevent the improper or impolitic exploitation of China in the interest of international financial combinations as opposed to China's own national interests.

These complex problems have been further complicated through the great changes which have occurred within the last two decades in the Orient, and signs are not wanting that still further complications are certain to arise. The

rapid and continuous growth of the German Empire and consequent changes in the balance of power in Europe; the advent of Japan as a first-class power; the spread of the Nationalist movement in India and in Egypt; the occupation of the Philippines by the United States (1898) as a result of the war with Spain; the decadence of Lamaist influence in Tibet—these, among many other causes, have operated to intensify the difficulties presented in various aspects of the Far Eastern Question.

But, overshadowing all these outside interests and influences, are the awakening of China itself and the amazing spread of the national and Republican spirit throughout what was, until 1911, the most conservative empire in the world. It is this process of nationalization in China, with its manifestations of immediate weaknesses and potential strength, which now seems to dominate the Far Eastern Question at all points; touching, on the one hand, upon some of the most delicate matters of purely European diplomacy, and, on the other, interlocking itself with the larger problems of Pacific development and Pacific control.

The Far Eastern Question, as such, may be said to have had its inception in the early contests between the Portuguese, Spanish, Dutch, and British traders for preëminence and predominance in the Oriental seas. And, just as it has reached its most acute stage with the fall of the Ta-Ching (or T'sing), commonly called the Manchu, dynasty, it received its first impetus during the conflict between Ming and Manchu which ended (in 1644) with the overthrow of the Ming dynasty. It was then (1610-44) that the Portuguese seized possession of Macao (occupied as a trading post, 1537; annexed, 1849), while the Dutch endeavored to dislodge Koxinga and his force of Ming adherents from the island of Formosa. It is also an important historical fact that it was the loss of Formosa to the Japanese (1895) which fanned into flame the spirit of Chinese nationality and contributed considerably towards extending the agitation which culminated in the establishment of the Chinese Republic (Feb. 12, 1912). Formosa and the island of Hongkong represented, and still represent, to the Chinese what the isles of Greece have always meant to the Macedonian and the Thessalonian. Restrained by the continually weakening hands of the Manchu bureaucracy, the Chinese, particularly in the southern and eastern provinces, chafed under the persisting pressure from without, which had increased rather than diminished with every concession granted rival foreign nations.

The creation by the British of a new Gibraltar at Hongkong (1842), with the later acquisition of the territory on China's mainland from Kowloon to Mils Bay and Deep Bay (1860-98); the advance of the French from the southern peninsula of Annam, threatening the rich provinces of Yunnan and of Kweichow and Kwangsi; and encroachments by Russia on China's western and northern borders, exasperated China and unquestionably had much to do with bringing about the war with Japan (1894-95), apart altogether from the direct cause of that rupture (conflicting interests in Korea). The war between Japan and China, while it revealed Japan's strength and China's weakness to an extent which astounded the outside world; and while, by the terms of the Treaty of Shimonoseki (1895), it cost China an indemnity of Hk. Taels

230,000,000 in addition to loss of territory as well as of prestige, warned her that her very existence as a nation was at stake. Thus arose China's willingness, amounting almost to desperation, to assume western ways and institutions and to turn to western powers for advice and for protection. While improving her relations with the United States, China naturally looked first for immediate assistance to her most powerful western neighbor, Russia. And Russia eagerly availed herself of the opportunity to profit under the cloak of friendship.

Balked by the Treaty of Berlin (1878) from forcing her way to a direct outlet on the Mediterranean and control of the Dardanelles, the foreign policy of Russia became absorbed in the task of finding an ice-free outlet somewhere on the Pacific. Colonization in Mongolia and North and South Manchuria was fostered under various pretexts; and plans were perfected to carry the Siberian Railway across Chinese territory from Stretensk to Vladivostok. Russia seized upon the Peace of Shimonoseki and China's eagerness for friendly mediation as the means of putting these plans into immediate effect. The original terms of the treaty (April 14, 1895) bound China (1) to agree to the complete independence of Korea; (2) to cede the Liaotung peninsula and its littoral; (3) also Formosa and the Pescadores; (4) to pay indemnity of Hk. Taels 200,000,000; (5) to open up Shashih, Chungking, Suchow, and Hangchow to commerce, and of the Yang-tse to navigation. Russia, with the assistance of Germany and France, England abstaining, secured the revocation of the second clause (relating to the Liaotung peninsula, etc.), compelling Japan to accept instead an additional Hk. Tls. 30,000,000 indemnity. The selfish motives behind the Russo-French-German compact were soon apparent. Russia proceeded immediately to carry out her railway plans and (1898) obtained possession of the southern part of the Liaotung peninsula with its two valuable harbors, Port Arthur and Talienwan (Dalny). Germany, under the pretext of compensation for the murder of two missionaries, secured the port of Kiaochow, and important concessions in Shantung Province (1898), while France improved her frontier lines in the Mekong valley, secured railway and mining concessions in Yunnan and Kiangsi, and (1898-99) a 99 years' lease of the Bay of Panchangwan, opposite the island of Hainan. Great Britain, in protection of her own interests and those of China, was given a lease of Wei-hai-wei as long as Russia held Port Arthur.

England was first among the European nations to recognize the growing power of Japan, and in the agreement (Jan. 30, 1902) which later became the Anglo-Japanese Alliance (renewed and extended, 1911) she directed her policy in the Far East to solidify her own interests and to support those of Japan. Japan, fretting under the curtailment of her conquests by Russia, and Russia's subsequent occupation of the Liaotung, set herself to checkmate Russia on the Far Eastern mainland. An excuse was presented through Russian exploitation in Korea (1903). Diplomatic controversies culminated in the Russo-Japanese War (1904-05), which ended in the discomfiture of Russia and her expulsion from the shores of the Yellow Sea.

Under the Treaty of Portsmouth (Sept. 5, 1905) Japan was given a free hand in Korea and received from Russia the leases of Port

Arthur and Dalny, together with their littoral; the South Manchurian Railway from Chingkiang to Port Arthur, and the mining and other rights pertaining to it; the southern half of Saghalien from the 50th latitude; the right of navigation in the bays of La Perouse and Tartary; and the rights of fishing in Russian territorial waters. At the same time (Aug. 12, 1905) there was promulgated an agreement between Great Britain and Japan which expressly guaranteed the maintenance of the *status quo* in the Far East. Korea was declared formally under the protection of Japan (Nov. 17, 1905) and was annexed (Aug. 22, 1910). During the latter part of 1909 Secretary of State Knox presented on behalf of the United States a proposal to neutralize the South Manchurian Railway. This proposal was rejected by Japan (Jan. 21, 1910), and the outbreak of the Chinese revolution (October, 1911) found practically all the European nations and Japan scrambling for new railway and other concessions.

The loss of the Liaotung peninsula and of the South Manchurian Railway to Japan deprived Russia of the use of the Chinese Eastern Railway for strategic purposes, and henceforth her aim has been to seek another outlet. Hardly had the ink dried upon the Portsmouth Treaty than the Russian government authorized the double-tracking of the Siberian Railway and granted the appropriation for the construction of the Amur lines. These works have been actively pushed ahead in the last four years, and the Amur line is nearing completion, while the double-tracking of the Siberian Railway is about 75 per cent completed. Many other lines are projected for the exploitation of central Asia, some of which have received the sanction of the Russian government. Vladivostok has been made practically impregnable, but, as it lies exposed to Japan, it may be captured in another war. As a commercial port, however, it has great disadvantages; for it is open for only half the year and can never serve as an adequate outlet for the great Siberian country and its rapidly extending trade and industries. Fronted by Japan in South Manchuria, Russia cannot hope to secure a seaport in that direction except through another costly and possibly more disastrous war. In most books dealing with Russian policy in Asia, the fact is emphasized that one of her great dreams is an approach to Peking across Mongolia via Kalgan. Recent Russian diplomacy is believed to suggest that she seeks an understanding with England to secure this direct right of way to the Yang-tse. Japan, however, appears to be cognizant of and antagonistic to these intentions, and it is now (June, 1914) proposed by Count Okuma, on the part of Japan, to ally Japanese and British interests in the Yang-tse. Formal recognition of the British "Sphere of Influence" in the Yang-tse valley, including Honan and Chekiang, as well as the provinces bordering on the river, dates from the Anglo-Russian Agreement (April 28, 1899) in which the Russian government specifically covenanted not to seek any concession within that sphere, England pledging herself not to seek concessions in Russia's sphere north of the Great Wall, the Shanhaikwan-Neuhwang Railway extension, previously provided for, being excepted from this provision.

Coincident with the outbreak of the Chinese revolution, disaffection occurred among the Mongolians of Outer Mongolia, and in the early part

of 1912 the Mongols, replying to Yuan Shih-kai's proclamation of March 26, refused to participate in the establishment of Republican government. Russia then concluded that the time had come when she could not only secure from the rebellious Mongols commercial privileges which she had been seeking from China, but that also, while maintaining her friendly position towards that country, she could raise up in Outer Mongolia a barrier against the immigration of Chinese within her own borders, which she had been endeavoring to resist. A convention with the Khalkas embodying these essential principles of Russian policy was determined upon, and in the latter part of 1911 a Russian diplomatic agent to Outer Mongolia arrived at Urga to put through these negotiations.

Difficulties arose between the Russian agent and the Mongolians themselves, and resentment of Russia's intrigue became very general in China. The Urga Convention (Nov. 3, 1912) declared that, in consideration of Russia's "lending her assistance to Mongolia in preserving the autonomous régime it has established, as well as the right to have her national army and to admit neither the presence of Chinese troops on her territory nor the colonization of her land by Chinese," the Mongols concede to the Russians the most complete freedom of trade (but no rights of monopoly) "in every kind of product of the soil and industry of Russia, Mongolia, and China." The convention further gave Russia the right to control any treaty arrangements the Mongolians may wish to enter into later "with the Chinese or another foreign power," and which might infringe or modify this convention. As soon as these terms were published, the Republican Parliament in Peking clamored for war with Mongolia and with Russia, if necessary. President Yuan Shih-kai dispatched a military force to deal with the Mongols and remonstrated with Russia. After protracted discussion a declaration was signed Nov. 3, 1913, on the part of Russia and China by which Russia recognized Chinese suzerainty over Outer Mongolia, while China recognized its autonomy. Russia pledged herself to send no troops to Mongolia beyond the consular guards, nor to intervene in the administration of the country, nor to attempt colonization. Diplomatic conversations were (June, 1914) proceeding with a view of establishing coöperation between Russia and China for the administration of Outer Mongolia. At the same time disagreement had occurred between the Mongols as to who should be their ruler, some favoring the *Hutuktu*, or, as he is also called, the *Boddo Khan* (holy prince), a lama, who is married and has two sons; and others the *Sainmoyin Khan*, president of the Council of Ministers. The ultimate choice may have an important bearing not merely upon future events in Mongolia, but also upon a correlated controversy, the question of Tibet. The Dalai Lama of Lhasa is recognized in Mongolia, but there, as in Tibet itself, Lamaism is believed to be disintegrating.

Russia's policy in regard to Mongolia and Manchuria led naturally to an aggressive English policy on the northern frontier of India. And this latter policy was assisted by the results of the Younghusband expedition and the difficulties which arose between the Dalai Lama and the Manchu Empire just prior to the Chinese revolution. Strategically the occupation of the lofty plateaus of Tibet is of

vast importance in the possible defense of England's Indian empire against invasion from the north. China has always claimed sovereignty over Tibet, and her suzerainty has been generally conceded. A conference was (June, 1914) proceeding, as a result of which it was hoped to amicably adjust British and Chinese interests in this ancient and conservative land of Lamaism.

The Far Eastern Question, it will thus be seen, had now entered upon an entirely new phase. First, an issue between certain purely European powers as to rival rights and expectations in the Orient, it then became a contest between European combinations and Japan as to which nation should profit most in the partition of the Chinese Empire. Japan—progressive, aggressive—required room for her rapidly growing population to expand freely and develop new importance. But China awakened before partition was more than begun. And China, with her millions of men, her concentrated energy, and her vast resources, bids fair to pronounce possibly a decisive note in the ultimate solution of the Far Eastern Question, which manifestly now presents itself in the most acute form it has yet assumed.

FAREL, fa'rél', GUILLAUME (1489-1565). A friend of Calvin and active promoter of the Reformation in Switzerland. He was born of noble family at Fareaux, near Gap, Dauphiné, in 1489. He studied in Paris, became professor in the Collège Le Moine, and was distinguished for his zeal for the Catholic church. Intercourse with the Waldenses and the influence of Lefèvre d'Estaples (see FABER) led him to accept the new teachings, and his vehement nature at once led him to attempt to make proselytes. In 1521 Bishop Briconnet provided for him at Meaux, but persecutions followed him there. He went to Basel and was kindly received by Ecclampadius, and there, on Feb. 15, 1524, he publicly sustained 13 theses on points in dispute between the Reformers and the church. He

preached in the Canton of Bern, and through his exertions the towns of Aigle, Bex, Olon, Morat, and Neuchâtel embraced the Reformation. From 1532 till 1538 he labored mainly at Geneva, but was compelled temporarily to leave the city several times. In 1535 the town council of Geneva formally proclaimed the Reformation, but the organization fell into Calvin's hands rather than Farel's. Both Reformers had to leave the city in 1538, and Farel went to Neuchâtel and did good service in setting the affairs of the church there in order. He was present at Geneva at the burning of Servetus in 1553. In 1557 he was sent with Beza to the Protestant princes of Germany to implore aid for the Waldenses and on his return sought a new sphere of labor in his native province. In November, 1561, he was thrown into prison, but was soon liberated. He died at Neuchâtel, Sept. 13, 1565. Farel's writings are not very important. Some of them may be found in *Du vrai usage de la croix* (Geneva, 1540; new ed., 1865). His letters are in Herminjard, *Correspondance des réformateurs dans les pays de la langue française* (9 vols., Geneva, 1866), and in the *Corpus Reformatorum* (Brunswick, 1834-1900). Consult: Kirchhofer, *Das Leben Wilhelm Farel's* (Zurich, 1831-33); Schmidt, *Etudes sur Farel* (Strassburg, 1836); id., *Wilhelm Farel und Peter Yvet* (Elberfeld, 1860); Bevan, *William Farel* (4th ed., London, 1893).

FARENHOLT, fär'en-hölt, OSCAR WALTER (1845-). An American naval officer, born near San Antonio, Tex. He entered the navy as a seaman in 1861, was wounded at Pocotaligo, S. C., participated in attacks on Charleston, S. C., and on Fort Sumter, and aided in the capture of Fort Fisher, N. C., and the recapture of Plymouth. He became acting ensign in 1864 and ensign in 1868, and thereafter was promoted through the various grades, becoming captain in 1900 and rear admiral in 1901. During the Spanish-American War he had charge of Dewey's base of supplies and information at Shanghai, China. He was commandant of the navy yard at Cavite, P. I., in 1900 and after commanding the *Monadnock* of the Asiatic Station in 1901 was retired. Farenholt is the only officer who ever rose from seaman to the rank of rear admiral in the United States navy.

FARENSBACH, fär'ens-bäg, JÜRGEN VON (1551-1602). A Livonian general. Sent as the Ambassador of Livonia to Czar Ivan the Terrible, for the purpose of concluding a treaty of peace, he entered the Russian service and greatly distinguished himself by winning the decisive battle of the Oka against the Tatars (Aug. 1, 1572). Afterward he served in the Danish and Polish armies and in 1586 was invested with the rank of a senator of the Polish crown by Sigismund III, whom he had assisted in gaining the throne of Poland. As field marshal of Poland, he subsequently fought against Sweden, where, however, he was defeated. He was killed in the attack on the castle of Fellin, May 17, 1602.

FAREWELL, CAPE. See CAPE FAREWELL.

FARFA, ABBEY OF. A Benedictine monastery, at one time among the richest and most famous of Italy, situated about 26 miles from Rome. It is said to have been founded in the middle of the sixth century by St. Laurence, Bishop of Spoleto, and soon reached a position of importance, receiving endowments from the Lombard and Carolingian rulers and from the

popes. The monks were driven out by the Saracen invaders about 890, and it lay desolate for 50 years. When Alberic set Odo of Cluny over all the monasteries in the neighborhood of Rome, attempts were made at reforming the ill-regulated lives of the monks, but at first without success. The zealous Abbot Hugo, however, brought in a new set of monks at the end of the tenth century, and Odilo of Cluny, visiting Italy, inspired him to introduce the Cluniac reform. Pope Nicholas II consecrated the conventual church in 1060, and learning began to flourish in a marked degree. The librarian of the monastery, Gregory of Catina, rendered a great service to Italian history by compiling between 1105 and 1119 the *Chronicon Farfense*. The riches of the abbey increased greatly, and it owned no less than 683 churches and convents, 2 towns, 132 castles, and over 30 villages and hamlets. From the end of the fourteenth century it was held in *commendam* by cardinals, and Gregory XVI annexed it in 1842 to the cardinal-bishopric of Sabina. *Il Chronicon Farfense* was published by Balzani (Rome, 1903); *Consuetudines Farfenses*, dating 1010, by Albers (Stuttgart, 1900).

FARGO, fär'gō. The largest city in North Dakota and the county seat of Cass County, 240 miles by rail northwest of Minneapolis, Minn., on the Red River of the North, and on the Northern Pacific, the Great Northern, and the Chicago, Milwaukee, and St. Paul railroads (Map: North Dakota, H 4). Fargo is an important grain market and one of the largest distribution centres for heavy farm machinery in the country. It has also extensive jobbing interests in groceries, fruits, and notions. Among its industrial establishments are knitting mills, creameries, a foundry, bottling works, and manufacturing of harness, candy, corsets, mattresses, bed springs, artificial limbs, trunks, cruckers, etc. Fargo is an educational centre, containing the North Dakota Agricultural College (founded in 1890), Fargo College (Congregational, opened in 1887), Sacred Heart Academy (Catholic), Oak Grove Seminary (Lutheran), the Western School of Expression, two music conservatories, and three public libraries. Other features are a United States land office, several hospitals, and a number of fine parks and drives. The city adopted the commission form of government in 1913. It owns and operates its water works and filtration plant. Settled in 1871, Fargo was incorporated in 1875. A fire on June 7, 1893, destroyed property valued at \$3,000,000. Pop., 1900, 9589; 1910, 14,331; 1914 (U. S. est.), 16,351; 1920, 21,961.

FARGO, WILLIAM GEORGE (1818-81). A pioneer American expressman, born at Pompey, N. Y. After working as a grocery clerk, freight agent, express messenger, and resident agent at Buffalo, he organized with Henry Wells, in 1844, Wells and Company (later, Livingston and Fargo), a carrying company in business between Buffalo and western points. This firm was consolidated with others in 1850 to form the American Express Company, of which Wells became president and Fargo secretary. Wells, Fargo, and Company was formed in the following year to take charge of an express business between New York and San Francisco by the way of the Isthmus of Panama and also on interior lines on the Pacific coast. From 1868 to 1881 Fargo was president of the American Express Company. He was also director of the New York

Central and Northern Pacific railroads and was mayor of Buffalo from 1862 to 1866.

FARGUS, FREDERICK JOHN (1847-85). An English novelist (pseudonym, Hugh Conway), born in Bristol. An auctioneer by trade—it was he who catalogued and valued the Strawberry Hill collection—he did not acquire reputation as an author until 1883, when he published *Called Back*, a novel which became very popular both in Europe and America, was translated into six languages, and successfully dramatized in London. Among other works may be mentioned: *Dark Days* (1884); *Slings and Arrows* (1883); *A Cardinal Sin* (1883); *Bound Together* (1884).

FARIA E SOUSA, fâ-rê'â ê sô'zû, MANOEL DE (1590-1649). A Portuguese-Spanish historian and poet. He was born upon an estate near Pombeiro, in the Province of Minho, was educated at Braga, entered the service of the Bishop of Oporto, but shortly after 1613 went to Madrid. In 1631 he was attached to the Portuguese Embassy at Rome, where his talents attracted the attention of Pope Urban VIII and many learned Italians. Returning to Spain, he again made his home in Madrid, where he died. His numerous historical works, written in Spanish, include: *Epítome de las historias portuguesas* (1628); *Asia portuguesa* (3 vols., 1666-75); *Africa portuguesa* (1681). His poems were collected under the title *Fuente de Aganipe, rimas varias* (4 vols., Madrid, 1644-46), besides three other volumes, *Fábula de Narciso é Echo*, *Divinas y humanas flores*, and *Noches claras* (Madrid, 1624-26). They consist of sonnets, eclogues, canzones, and madrigals, most of them written in Spanish. About 200 of the sonnets, however, and 12 eclogues are in the Portuguese language. He is also the author of a commentary upon the *Lusiad*, which, though thoroughly uncritical, is not without interest to students of Camões.

FARIBAULT, fâr'i-bô. A city and the county seat of Rice Co., Minn., 52 miles by rail south of St. Paul, at the junction of the Straight and Cannon rivers, and on the Chicago, Milwaukee, and St. Paul, the Chicago, Great Western, the Pennsylvania, and the Chicago, Rock Island, and Pacific railroads (Map: Minnesota, D 6). It has a fine location, in a region which abounds in beautiful lakes. Faribault is noted as an educational centre, having State institutions for the deaf, blind, and feeble-minded, the Seabury Divinity School (opened in 1859), the Shattuck School for Boys, St. Mary's School for Girls (Protestant Episcopal), and Bethlehem Academy for Girls (Roman Catholic). There is a public library. The industrial plants include piano, wagon, shoe, gasoline-engine, nutting-truck, butter-tub, and furniture factories, and flouring and woolen mills. Faribault was settled about 1853 and incorporated about 1872. It adopted the commission form of government in 1911. The city owns and operates its water works. It was the home of Bishop Whipple, well known for his labors among the Indians. Pop., 1900, 7868; 1910, 9001; 1920, 11,089.

FARIBAULT, fârê-bô', EUGENE RODOLPHE (1860-). A Canadian geologist. He was born at L'Assomption, Province of Quebec, and was educated at the Ecole Polytechnique and, in civil engineering and practical science, at Laval University, Quebec. In 1881 he entered the service of the Canadian Geological Survey and in

1884-1909 conducted a geological survey of the gold fields of Nova Scotia. In 1900 he was in charge of the Canadian mineral exhibit at the Paris Exhibition and was a juror representing British colonies exhibiting there. At the same exhibition he was awarded a gold medal for his model of the Goldenville gold mine and geological work in the Nova Scotia gold fields, and he received a similar award at the St. Louis Exposition in 1904. He published: *The Gold Measures of Nova Scotia and Deep Mining* (1899); *Nova Scotian Deep Gold Mining* (1903); and numerous articles in the *Annual Reports of the Geological Survey* (1885 et seq.).

FARIDKOT, fur'ed-kôt'. A native Sikh state of Punjab, India, with a capital of the same name 84 miles southeast of Lahore (Map: India, B 2). Area, 642 square miles. Pop., 1901, 124,912; 1911, 130,294.

FARIDU'D-DÎN 'ATTÂR, fâ-rêd'ud dên ât-târ' (?1120-1221). A Persian poet and mystic. He was the son of a druggist, and his real name was Muhammad ibn Ibrahim, his better-known appellation, Faridu'd-Dîn 'Attâr ('the pearl of the faith, the druggist'), being a poet's name, or *takhallus*. The only certainty regarding the date of his birth is that it was probably antecedent to 1150. He spent 13 years of his childhood by the shrine of the Imâm Ridâ, and, after having traveled extensively in Egypt, India, and Turkestan, he returned to his native town, Nîshâpûr, where he spent the greater part of his life. One of his last works, a poem entitled *Madhharu'l-'Ajâ'ib* ('Manifestation of Wonders'), aroused the animosity of a theologian, who caused its author to be banished as a heretic. After this 'Attâr appears to have retired to Mecca, where he wrote his last work, the poem *Lisânu'l-Ghayb*, in which traces of his waning powers are evident. The date of his death is yet more or less a matter of conjecture. He studied the mystic philosophy of the Sufis and was its principal representative after his pupil Jalâlu'd-Dîn-i-Rûmî. His most famous work is the "Mantiqu'î-Tayr," or parliament of birds, an allegorical poem of 4600 couplets, according to which the birds longed for a king. As the hoopoe who had guided Solomon through the desert best knows what a king should be, he is asked whom they shall choose. "The Sîmûrgh in the Caucasus," is his reply. Only a few birds set out; but by the time they reach the great King's court, their number is reduced to 30. The 30 birds at length gain access to their chosen monarch, the Sîmûrgh; but only to find that they strangely lose their identity in his presence—that they are he, and he is they. 'Attâr also wrote the *Pandnâmah*, or 'Book of Counsel,' and *The Tadhkiratu'l-Awliyâ*, or 'Memoirs of the Saints,' edited by Nicholson (London, 1905). The *Pandnâmah* has been best edited and translated by De Lacy (Paris, 1879) and has also been rendered into German by Nesselmann (Königsberg, 1871). Consult: Garcin de Tassy, *Mantic uttair ou le langage des oiseaux, poème de philosophie religieuse, par Farid-uddin Attar* (Paris, 1857-63); Fitzgerald, *Salâmân and Absâl . . . together with a Bird's-eye View of Farid-uddin Attar's Bird-Parliament*, ed. by Dole (Boston, 1899); Geldner, "Die altpersische Literatur," in *Die orientalischen Literaturen* (Leipzig, 1906); Horn, *Geschichte der persischen Literatur* (ib., 1901); Browne, *Literary History of Persia* (New York, 1906).

FARINA, fâ-rî'nâ or fâ-rê'nâ (Lat., flour

from *far*, coarse grain). The flour or powder of substances rich in starch, including cereal grains, as wheat and rice, leguminous seeds, as peas and beans, and roots, such as potato and arrowroot, and other like compounds. In England potato starch is exclusively known as *farina*. When used in America, the term "*farina*" generally means a granulated food product prepared from the inner portion of the finest winter wheat, although the name is occasionally employed when referring to a preparation from white maize. *Farina* is an important constituent of numerous prepared foods that are called *farinaceous* on account of the starch that they contain. It is used extensively as a breakfast cereal known as "cream of wheat" and in the preparation of puddings. In botany the pollen of flowers was formerly called *farina*.

FARINA, GIUSEPPE LA. See LA FARINA.

FARINA, fà-rè'nà, SALVATORE (1840-). A popular Italian novelist, with a gift for humor and for graphic portrayal of character. He was born at Sorso, in Sardinia, and studied law at Turin and Pavia, but after graduation devoted himself to a literary career and made his home permanently at Milan. For many years *Farina* was in charge of the literary department of the *Gazzetta Musicale*. Typical romances are: *Amore bendato* (1873); *Più forte dell'amore* (1890); and *Il signor Io* (1880), which is called his masterpiece. An autobiography in three volumes was in process of publication in 1914.

FARINATI, fà-rè-nà'tè, or FARINATO, fà-rè-nà'tò, PAOLO (1522-1600). A Veronese painter of the Renaissance. He was the pupil of Niccolò Giolfinio and Antonio Badile, and formed his early style, in which he did much excellent work, after *Brusasorci* and *Torrido*. Later he was influenced by Paolo Veronese and Giulio Romano, and finally he sank into the mannerisms of *Parmigiano* and his school. His best works are amply conceived and distinguished by a warm golden tone unusual for Verona. He also produced etchings that show originality and power. Most of his paintings are in the Museum and churches of Verona; they include the fresco "St. Michael," in Santa Maria in Organo, frescoes in San Nazaro, and "The Miracle of the Loaves and Fishes" (1603), in San Giorgio. Other good examples are "St. Martin in the Cathedral of Mantua," "Presentation in the Temple" (Berlin Museum), and "Abraham and Hagar" (New York Historical Society). His son and pupil, Orazio, painted historical subjects.

FARINELLI, fà-rè-nè'lè, CARLO (1705-82). An Italian singer whose real name was Broschi. He was the most remarkable male soprano known, his voice being of unequaled compass, possessing seven or eight notes more than those of ordinary vocalists. When still a child, he was known all over Italy as *il ragazzo* (the boy), and from 1722 his career was one unbroken triumph. In Vienna he evoked a frenzy of enthusiasm by his dazzling feats of vocalization, but on the advice of Charles VI applied himself to sustained singing and became equally great as a dramatic singer. In London (1734) *Farinelli's* presence in the company of his former teacher, Porpora, then in an operatic war with Handel, caused the latter to withdraw and thenceforth to devote himself to oratorio. In Spain *Farinelli's* voice lightened the melancholia of Philip V. He became a great power at court

and continued such until 1759, when Charles III banished him. He built himself a palace in Bologna (1761) and there lived in royal luxury. Sachi wrote a *Vita der Cav. Don Carlo Broschi, detto Farinelli* (Venice, 1784).

FARINI, fà-rè'nè, LUIGI CARLO (1812-66). An Italian statesman and historian, whose name stands next to those of Garibaldi and Cavour in the long struggle for united Italy. He was born at Russi, near Ravenna, graduated in medicine at Bologna 20 years later, and for a time practiced successfully as a physician. His share in the revolutionary movement of 1843 forced him, however, to leave the Roman States and live in exile in France, until the granting of the amnesty which followed shortly after the accession of Pius IX. In 1847 he entered the Liberal cabinet as general secretary to Gaetano Rossi, the Minister of the Interior, and later became director general of the sanitary department. After the assassination of Rossi, the flight of the Pope to Gaeta, and the proclamation of the Republic at Rome, *Farini* withdrew to Tuscany, and upon the occupation of Rome by the French made his home in Piedmont, where he devoted himself to literary pursuits. He founded the satirical journal *La Frusta*, to support the ministry of D'Azeglio, and became attached to the staff of Cavour's *Risorgimento*, but still had time during these years to write his most noted work, *Lo stato romano dall'anno 1814 fin al 1860* (1853), which shows him a clear-sighted, even if at times a partisan, historian, and which was translated into English under the superintendence of Gladstone (1859). Having become a citizen of Piedmont, he was elected deputy to the Legislature, and in 1851 became Minister of Public Instruction in D'Azeglio's cabinet, resigning the following year. In 1859 he was sent to Modena as royal commissary, was there proclaimed Dictator, and in 1860 exerted his influence in Parma, Bologna, and Florence, in favor of a united Italy under Victor Emmanuel. In 1860 he became Minister of the Interior in Cavour's new cabinet. Later he accompanied the King to Naples and remained there as civil Governor. Upon the downfall of Rattazzi's ministry in 1862, he was asked to form a new ministry, but was soon after forced to retire, owing to failing health. His mind became affected, and he died Aug. 1, 1866, near Genoa. Besides the *Roman State* above mentioned, *Farini* wrote a continuation of *Botta's Italian history, Storia d'Italia dall'anno 1814 fine ai nostri giorni* (1854-59). For further details of *Farini's* life, consult: *Bersazio*, in *Contemporanei Italiani* (Turin, 1860); *Mauri*, in *Scritti biographici* (Florence, 1878); *Finali*, in *Nuova Antologia* (ib., 1878).

FARJEON, fàr'jon, BENJAMIN LEOPOLD (1833-1903). An English novelist, born in London. He early went to Australia, where for a time he worked in the gold diggings. Subsequently he proceeded to New Zealand, where he wrote his first book, *Shadows on the Snow*, and in 1861 assisted in establishing at Dunedin the *Otago Daily Times*, the first daily journal published in the colony. Upon his return to London he worked as a dramatist, and in 1870 won his first success in prose fiction with *Grif*. In 1877 he gave public readings in the United States from his story *Blade-o'-Grass* (1874; new ed., 1899). Other works of his are: *Joshua Marvel* (1872); *London's Heart* (1874); *Bread and Cheese and Kisses* (1874; new ed., 1901); *The*

House of White Shadows (1884); *Samuel Boyd of Catchpole Square* (1899); *The Mesmerists* (1900); and a play, *Home Sweet Home* (1876). His skill in the development of the intricacies of a melodramatic plot has been likened to that of Wilkie Collins. His works have been translated into Spanish, Italian, French, and German.

FARLEY, JAMES LEWIS (1823-85). An English author, born in Dublin and educated at Trinity College in that city. Upon the formation of the Ottoman Bank in Turkey he was appointed chief accountant of the Beirut branch, which had been established by him. In 1860 he became accountant general of the State Bank of Turkey, Constantinople, which afterward became incorporated with the Imperial Ottoman Bank. He did much to establish pleasant relations between England and the Levant, and in March, 1870, was appointed Consul at Bristol by the Sultan. His numerous works on the Orient include: *Two Years in Syria* (1858); *The Druses and the Maronites* (1861); *The Resources of Turkey* (1863); *Turkey* (1866); *Turks and Christians* (1876), containing suggestions which the Porte was subsequently compelled to put into effect; *Egypt, Cyprus, and Asiatic Turkey* (1878); *New Bulgaria* (1880), one result of his holding the position of privy counselor in the Bulgarian Public Works Department.

FARLEY, JOHN (MURPHY), CARDINAL (1842-1918). An American Roman Catholic prelate, born at Newton Hamilton, County Armagh, Ireland. He came to America after his education had begun, was a student in St. John's College, Fordham, and in St. Joseph's Seminary at Troy, and completed his theological studies at the American College in Rome. Here he was ordained in 1870, and two years later, after a pastorate in Staten Island, he became secretary to Cardinal McCloskey. He was unanimously chosen rector of the American College; but the Cardinal, unwilling to part with him, recommended him to the Pope for the honorary appointment of private chamberlain. In 1891 he became vicar-general of the archdiocese of New York, and in 1895 he was appointed prothonotary apostolic. Soon afterward he was made Assistant Bishop. Early in 1902 his name was mentioned for the post of coadjutor of the Archbishop, but the latter's death rendered necessary the appointment of a successor instead of a coadjutor. Farley was the unanimous choice, being mentioned first in the lists alike of the clergy of the diocese, the bishops of the provinces, and the archbishops of the United States. His official appointment to the see followed in October of the same year. In 1911 he was made Cardinal. He wrote a *Life of Cardinal McCloskey* (1900).

FARLOW, WILLIAM GILSON (1844-1919). An American botanist. He was born in Boston and graduated (A.B., 1866; M.D., 1870) from Harvard University, where, after several years of European study, he became adjunct professor of botany in 1874 and professor of cryptogamic botany in 1879. In 1899 he was president of the American Society of Naturalists, in 1904 of the National Academy of Sciences, in 1905 of the American Association for the Advancement of Science, and in 1911 of the Botanical Society of America. He received the degree of LL.D. from Harvard, Glasgow, and Wisconsin. Among his publications are: *The Gymnosporangia or Cedar Apples of the United States* (1880); *Marine*

Algæ of New England (1881); *A Provisional Host-Index of the Fungi of the United States* (1888); *Biographical Index of North American Fungi* (1905).

FARMAN, ELBERT ELI (1831-1911). An American jurist and diplomat. He was born at New Haven, Oswego Co., N. Y., and was educated at Amherst College and in Europe. He was Consul General at Cairo, Egypt, from 1876 to 1881, and a judge of the mixed tribunal from 1881 to 1884, in which capacity he displayed exceptional ability and earnestly though unsuccessfully endeavored to secure the abolition of slavery. In 1879 he arranged for the transfer to America of one of the two obelisks known by the name "Cleopatra's Needle," one now being in Central Park, New York, and the other on the Thames Embankment, London. His publications include *Along the Nile with General Grant* (1904) and *Egypt and its Betrayal* (1908).

FARMAN, făr'măn', HENRI. A French pioneer in aviation and manufacturer of aeroplanes. He first attracted notice as a bicycle racer, then engaged in the manufacture of bicycles and motor cars, and finally he perfected the Henri Farman biplane. He was the second man in Europe to leave the ground in a heavier-than-air flying machine. In 1908 he flew from Châlons to Reims. In the following year he established the world record for distance of flight by flying 144¼ miles, and in the same year he broke the world record for duration of flight by remaining in the air 8 hours and 12 minutes. He was made a chevalier of the Legion of Honor in 1909. See AERONAUTICS, Aviation.

FARM BUILDINGS. The various buildings necessary for the occupation and operation of a farm are collectively known in England as the homestead, in Scotland as the onstead or stead, in America as the homestead or farmstead. They include the farmhouse with its attendant buildings providing accommodations for the farmer and his family and the farm laborers, and the barn and its attendant buildings providing for the storage and preparation for use of the farm products, storage of farm implements and machinery, the housing and care of stock, etc. Convenient, commodious, well-constructed, and well-arranged farm buildings for these purposes are essential to successful farming, both from the standpoint of the comfort and happiness of the farmer and from that of the proper care of the live stock, products, and equipment of the farm. For example, it is a generally recognized fact that well-housed animals thrive better and make a better return for the food consumed than those unduly exposed to cold and inclement weather, i.e., it is profitable as well as humane to house stock well. The investment in farm buildings is relatively smaller in the United States than in the older countries of the world, but is steadily increasing. According to the United States census of 1910, 15.4 per cent of the total capital invested in farms and their equipment was for farm buildings.

The character of farm buildings will of course vary with the size of the farm and the system of farming practiced, whether grain, truck, or fruit farming, stock raising, dairying, poultry raising, etc. The requirements as regards such buildings have undergone and are undergoing great changes due to improvements of all kinds

—the increased use of farm machinery, the keeping of more and better stock, superior methods of preparing and using feeding stuffs, etc. The most marked result of this change is seen in the tendency to make the homestead more compact, to reduce the number of separate buildings, and provide for a greater variety of purposes in a few larger buildings, as explained under BARN. The character of modern agriculture is such that farm buildings are becoming as complex in design and varied in use as factories, and indeed, in a sense, they are factories for the manufacture of marketable products—meat, milk, etc. The old practice of providing 20 or more separate buildings and scattering them over the farm is both inconvenient and expensive. The labor of collecting the crops in one place is less than is involved in passing from place to place to feed them out. The extent to which centralization is desirable, however, will depend largely upon the size of the farm. In case of very large farms, e.g., it may be of decided advantage to scatter the farm buildings somewhat. The danger of serious loss by fire is increased when the buildings are compactly grouped, but this is largely met by insurance against fire. It is not considered advisable to place the barn and outbuildings so near the farmhouse that fire in case of one necessarily endangers the other or the odors of the barnyard are offensive to the occupants of the house. However, it is important as a rule that the farmhouse should be located within a convenient distance of the barn, although not so near as to seem a part of the outbuildings. The homestead should be centrally located on the farm, in communication with as many fields as possible, and where an abundant supply of good water, good drainage, and plenty of light and air can be secured without unnecessary exposure to unfavorable weather conditions.

Three essentials to be considered in the construction of the ordinary farmhouse are comfort, convenience, and economy. It is hardly necessary to add that it is also important that the house should be attractive in appearance, with sanitary and pleasant surroundings. It should be planned with reference to future needs as well as present requirements and so designed that it may be enlarged without impairing its symmetry of proportions or convenience of arrangement. Having decided upon the general features which the house must possess, it is, as a rule, best to employ a competent architect or builder to plan and work out the details of construction. This may be said with equal truth of all other farm buildings, except those of very simple construction. In planning the barn and outbuildings, as in case of the farmhouse, the purposes for which they are to be used should be carefully considered in advance to the end that they may be conveniently arranged, of ample capacity, and may be enlarged without undue resort to annexes, lean-tos, sheds, etc. With the increased production of high-bred, high-priced stock, ventilation and sanitation of stables are second in importance only to those of dwelling houses. The large choice of building material now available makes better construction than in former years possible, although the questions of the best material for construction and best methods of ventilation and sanitation are in large part still unsolved. Among the structures forming most important additions to modern farm equipment are the silo (q.v.) and cold-storage houses and cellars.

P. Willis, "The Preservative Treatment of Farm Timbers," in *United States Department of Agriculture, Farmers' Bulletin 387* (1910).

FARM DEMONSTRATION means the demonstration of the methods of successful farming directly to men on the farms. It is essentially teaching by means of object lessons. Systems of farm demonstration have been evolved to make agricultural information immediately and positively effective and to have it reach all classes engaged in farm work. At the close of the last century itinerant agricultural demonstrators and advisers had become permanently established officials in a number of European countries, while in the United States the work has come into prominence mainly since 1900. The spread of the cotton-boll weevil in the United States gave impetus to the development of the work. With the beginning of 1904 the farmers' cooperative demonstration work was inaugurated by the United States Department of Agriculture to counteract the effect of this insect pest by improvements in cultural and other methods. A corps of field agents is in charge of the practical work which is carried on in cooperation with farmers agreeing to work the crops according to instructions to bring out the value of the methods. This work is observed and its results inspected by the farmers of the community, who are in many cases assembled for the purpose. Farm demonstration is not confined to the cotton States, but is conducted in various ways in practically all the States and often provided for under State laws. Support is given the movement by numerous agencies, such as the agricultural colleges, railroads, industrial concerns, bankers' associations, philanthropic and other organizations, and similarly interested parties. This work now stands ready to receive further Federal aid through the law providing for agricultural extension work in all the States. Consult "Demonstration Work on Southern Farms," *United States Department of Agriculture, Bulletin 422* (1910).

FARM MANAGEMENT is a branch of agriculture and applied economics treating of the business principles involved in the organization and management of farm enterprises for the greatest continuous profit. It places the operation of a farm on a business basis with a view to producing at the lowest cost and to selling to the best advantage. Farm management involves the consideration of numerous factors and their correlation and arrangement according to their logical sequence and importance. It compares the advantages and disadvantages of farming and farm life with those of other forms of business and life in the city, points out the personal qualifications required for successful farm-

ing, and outlines methods of securing land and entering upon its operation. The subject also includes the selection of the locality based on the consideration of soil, climatic, economic, and social conditions, the choice of the individual farm, and especially the adoption of the type of farming as determined by the local conditions and the economic relations of all the different lines of farm production, such as crop growing, stock raising, and the like. It deals, further, with the organization of the farm, consisting largely of the coördination of the chosen lines of work for the purpose of obtaining the most desirable distribution of labor throughout the year and of securing a maximum use of equipment and capital with a minimum outlay. This phase of the farm business exacts a study of the character, quality, and cost of equipment required and of the distribution of the necessary capital among the different factors of production and also takes into account the cost of production and the profits resulting from the various lines of work.

The most comprehensive subdivision of the entire subject of farm management is farm operation. This treats of the systems of operation as a means of conducting the farm business and points out the advantages and disadvantages of operation by the owner and his family, by the employ of hired labor, and by means of tenants. The use of the tenant system necessitates the consideration of the kind of rent, such as cash or share rent, and the character of the lease or contract between lessor and lessee. Among the numerous other topics grouped under farm operation may be mentioned the keeping of farm records and accounts, including the division of the profits of the farm between labor and capital and the determination of the comparative remunerativeness of the different lines of work, the direction of all forms of labor, the care and maintenance of equipment, the grading of live stock as to individual efficiency, the marketing of the products, and other similar subjects.

Farm management as a separate branch of agricultural science is of recent development. In the United States strictly farm-management investigations were first taken up by the agricultural experiment station of Minnesota in 1902. Shortly after, the office of farm management was organized in the Department of Agriculture, and since then the subject has received continuous attention and has spread to many of the agricultural institutions over the country. Instruction in farm management is now given in most of the State agricultural colleges, and this development has taken place since 1905. The office of farm management and the experiment stations have made numerous studies of systems of farming as followed in various sections, counties, or townships, of the capital invested, the labor and other expenses of operation, the amount and value of the products, and the net returns to the farmer and his family. Such studies have naturally led into farm accounting and estimation of the cost of production. Numerous farm-management surveys have been made for the purpose of studying the profits of the individual farmer to determine the factors controlling his income. These studies have given an analysis of the farmer's business, have shown the relative efficiency of labor under different farm conditions, and have resulted in a more intimate knowledge of the detailed practices and of the limiting factors by which they are governed and which affect their profitable-

ness. The results of this work have made it possible to draw up plans and specifications for the organization and administration of farms and to meet increasing demands in that line. For the purpose of promoting the work in the United States the American Farm Management Association was organized in 1911. A considerable literature has grown up on the subject, consisting mainly of bulletins of the Department of Agriculture and the experiment stations. Consult: "What is Farm Management," *Department of Agriculture, Bureau of Plant Industry, Bulletin 259* (Washington, 1912); Warren, *Farm Management* (New York, 1913); "Farm Management," *Organization of Research and Teaching, Minnesota Experiment Station, Bulletin 125* (1912).

FARMER, HUGH (1714-87). An English independent clergyman, born in St. Chad, Shrewsbury (Shropshire). He was a pupil of Dr. Philip Doddridge and from 1739 until 1780 was pastor of a church at Walthamstow, London. From 1761 to 1772 he was also afternoon preacher at Salters' Hall, and from 1762 to 1780 a preacher at the Tuesday morning "merchants' lecture." His reputation as a pulpit expositor was high. As a writer, he was considerably in advance of the theology of his time, although he never clearly defined his own position. His publications include *An Inquiry into the Nature and Design of Christ's Temptation in the Wilderness* (1761; 5th ed., 1822) and *An Essay on the Demoniacs of the New Testament* (1775; 4th ed., called the 3d, 1818). The former argued that the temptation of our Lord was a divine vision and therefore subjective; the latter, that demoniacs were merely afflicted by certain diseases. Consult Dodson, *Memoirs of the Life and Writings of the Reverend Hugh Farmer* (London, 1804).

FARMER, JOHN (1789-1838). An American historian and genealogist, born at Chelmsford, Mass. He was a founder of the New Hampshire Historical Society. Besides editing the first volume of Belknap's *History of New Hampshire* (1831), he published a valuable *Genealogical Register of the First Settlers of New England* (1820); histories of Billerica and Amherst (1806, 1820), and, in collaboration with J. B. Moore, *A Gazetteer of New Hampshire* (1823). Consult the *Memoir of John Farmer* (Boston, 1884) by Le Bosquet.

FARMER, JOHN BRETLAND (1865-). An English botanist, born at Atherstone and educated at Magdalen College, Oxford. He was fellow of Magdalen in 1889-97, demonstrator of botany in 1887-92 and assistant professor of biology in 1892-95 at Oxford, and then became professor of botany in the (London) Imperial College of Science and Technology. He was an editor of the *Annals of Botany* and wrote particularly on cytology.

FARMER, MOSES GERRISH (1820-92). An American inventor and electrician. He was born in Boscawen (now Webster), N. H., and was educated at Andover, N. H. His early inventions included a new kind of window shade and paper curtain, and by means of machinery he was able to supply the extraordinary demand for them that soon arose. Becoming interested in electrical science he invented an electromagnetic engine and electrical locomotive. He devised the municipal fire alarm which was adopted by the city of Boston and very quickly by other cities all over the country. (See FIRE

ALARM.) He moved to Salem in 1848, and became superintendent of the telegraph line from Boston to Burlington, Vt., inventing many improvements in telegraphy, among them a quadruple system by which four messages were sent simultaneously over the same wire. In 1852 he invented an electrical cooking stove. In 1855 he succeeded in electrically depositing aluminium and constructed for the Dudley Astronomical Observatory in Albany a chronograph and electrical clock. In 1856 he made an electric gyroscope so as to run continuously at uniform speed, and read a paper on multiplex telegraphy before the American Association for the Advancement of Science. In 1859 he lighted his parlor in Salem with an incandescent electric lamp, deciding, however, that a galvanic battery could not be used as a source of electric lighting. From 1864 to 1868 he experimented with alloys, and coated iron and steel wire with copper in order to combine great tensile strength with high conductivity. In 1868 he had a dynamo made with which he lighted 40 incandescent lamps in multiple arrangement. In 1872 he was appointed electrician to the United States Torpedo Station at Newport, but resigned on account of paralysis in 1881. On July 26, 1897, on the fiftieth anniversary of the exhibition at Dover, N. H., by Farmer of the first operative electric railway, the general meeting of the American Institute of Electrical Engineers was held at Elliot, Me. Here are preserved Farmer's workshop and notebooks, and here the inventor lies buried. Consult Dolbear, "Moses G. Farmer as an Electrical Pioneer," in *Electricity* (New York, 1894).

FARMER, RICHARD (1735-97). An English scholar and author, born at Leicester (Leicestershire). He graduated in 1757 at Emmanuel College, Cambridge, in 1760 became classical tutor of the college, and in 1775 its master. In 1778 he was elected principal librarian of the university, and in 1788 was appointed by Pitt to a residentiary prebend in St. Paul's, London. He was an intimate friend of Dr. Johnson, whom he met upon the occasion of the latter's visit to Cambridge in 1765, and of whose Literary Club he was a member. As the head of Emmanuel College, he was markedly successful, and for years he was the most influential person at Cambridge. In 1775 he became vice chancellor of the university. He is described as eccentric to a degree and supremely indolent. His only published work is the *Essay on the Learning of Shakespeare* (1767), a scholarly and most valuable demonstration of the fact that the poet's knowledge of Latin, Greek, French, Italian, and Spanish literatures was derived from English translations and references. This famous commentary has remained unsurpassed in its field. Farmer was elected a fellow of the Society of Antiquaries of London in 1763, and twice declined a bishopric proffered him as a recognition of his stout Toryism. Consult Nichols, *Literary Anecdotes of the Eighteenth Century*, vol. ii (London, 1812-15).

FARMER, GEORGE. A popular name given to George III of England because of his dress, manners, and habits. He is said to have kept a farm for the small profit rather than for pleasure.

FARMERS' ALLIANCE. A political party in the United States, which became of national importance in 1890, especially in the South and West. The movement originated as far back as

1873 and after the decline of the Grange (q.v.) succeeded it in importance and, in general, in principles also. It was especially strong in Texas, and kindred societies grew up in other States, such as the Wheel in Arkansas, founded in 1882, and the Farmers' Union in Louisiana. In 1887 a national alliance was formed out of several State societies, and its political character soon became marked. Meetings were held in 1888 and in 1889, and at the latter a platform of principles was agreed upon by the Alliance and the Knights of Labor, and the name became National Farmers' Alliance and Industrial Union. The platform demanded the abolition of national banks, increased issues of legal-tender greenbacks, laws against dealings in futures of agricultural and mechanical products, free and unlimited coinage of silver, and government ownership of all means of transportation and intercourse. In the South the Alliance demanded the establishment by the government of subtreasury warehouses where farmers could deposit their products and receive currency in exchange, and also the opportunity to borrow money from the government at nominal interest. In the campaign of 1890 the Alliance in the South did not put forth separate candidates, but dictated the nominations of the Democratic party, especially in South Carolina. In the West there were separate nominations. The election gave the Alliance the control of the legislatures of Kansas and Nebraska, and the balance of power in Illinois, Minnesota, and South Dakota. It sent nine men to the House of Representatives, and Senators from Kansas, South Dakota, and South Carolina, but the latter was called a Democrat. In 1892 the organization united with other elements and formed the Populist party (q.v.), nominating a President. This was not done without a split in the Alliance, however, most of the Southern members refusing to leave their old political connections. The new party continued the demand for the subtreasury scheme, free silver, more greenbacks, and public ownership of means of communication and transportation. The Alliance ceased to be a political party, but continued as an agricultural organization. United with several similar organizations into a Farmers' National Congress, in 1914 it represented something over 3,000,000 farmers. It urged Federal aid for inland communications, a head tax and illiteracy test for immigration, protection for coöperative enterprises, and opposed ship subsidies, free distribution of seed, and interstate liquor traffic into dry territory. See Woodburn, *Political Parties* (2d ed., New York, 1914).

FARMER'S ALMANAC, THE. An annual publication, from 1809 to 1880, by Josh Billings (Henry Shaw). It parodied the old *Farmers' Almanac* and became very popular. Its sales reached several hundred thousand copies.

FARMER'S BOY, THE. A famous poem by Robert Bloomfield, published in 1800.

FARMERS-GENERAL (Fr. *fermiers-général*). The name given to the members of a privileged association in France, who farmed or leased the public revenue of the nation under the old régime. This peculiar system of tax gathering dated from the early fourteenth century, when the *gabelle*, or salt tax, was farmed out in order to raise money for the war against England. In time other taxes were instituted and farmed out, until in the year 1720 there was a

special administrative board formed, presided over by one of the farmers-general or by one of his assistants for each class of imposts. The Minister of Finance selected the farmers-general at his pleasure, but his choice was generally influenced by bribes (*pot-de-vin*). The royal favorites were frequently given control of various imposts in lieu of pensions. The number of farmers-general was ordinarily 40, but shortly before the Revolution it had risen to 60. The annual national revenue to be collected was fixed at a certain amount, and all returns above this sum went into the pockets of the farmers-general, many if not most of whom accumulated large fortunes, though names like those of Helvétius, Dupin, and Lavoisier indicate that they were not all personally corrupt. Those in power were bribed to support this corrupt and ruinous financial system, though Turgot and Necker sought to change it. The constitution of 1791 did away with the farming of the revenues, while the Revolutionary Tribunal sent many of the ex-farmers-general to the guillotine. Consult: C. Gomet, *Les causes financières de la révolution française* (2 vols., Paris, 1892-03); R. Stourm, *Les finances de l'ancien régime et de la révolution* (2 vols., ib., 1885); De Nervo, *Les finances françaises sous l'ancienne monarchie, etc.* (ib., 1863); Lemoine, *Les derniers fermiers-général* (ib., 1873); Vuitry, *Études sur la régime financier de la France avant la révolution de 1789* (ib., 1883); Bouchard, *Système financier de l'ancienne monarchie* (ib., 1891); Tocqueville, *France before the Revolution of 1789* (Eng. trans., London, 1888); Taine, *The Ancient Régime* (Eng. trans., ib., 1876); Lowell, *The Eve of the French Revolution* (Boston, 1892).

FARMERS' INSTITUTE. A meeting of farmers for mutual improvement in their business or home life. These meetings have grown out of the public meetings held at a comparatively early day in the United States under the auspices of local or State agricultural societies. The institutes are carried on under varied auspices and are supported in very different ways in different sections, but the character of the meetings themselves is essentially the same everywhere. They may last but half a day, as in Louisiana, where the farmers assemble once a month at the experiment stations, or may continue three or four days. The winter, when the stress of farm work is somewhat lessened, is the season usually favored; but in some States very successful meetings have been held at other seasons of the year.

In practically all the States and Canada the farmers' institutes are now organized, with a director or other officer in charge, and enjoy State appropriation. They are commonly under the management of the agricultural colleges. Great improvement in these meetings has been made in recent years, and they are no longer experience meetings or for political purposes, but are in the hands of capable speakers. The programmes are planned to promote the interchange of ideas, a full and free discussion being sought upon topics introduced in an address or paper by some specialist. Officers of agricultural colleges and experiment stations, and other experts, as well as successful farmers who have attained more than local reputation, are usually selected as institute workers by those who have charge of the system of institutes for the State. These workers may also be chosen by the local authorities from lists of such workers

prepared by a central bureau. The local committee invites successful farmers of the neighboring districts to explain their methods, provides music and literary or other general exercises, and arranges for the place of meeting, refreshments, and advertising. A "question box" is frequently made use of, answers being given by the conductor of the institute, or by some one specially fitted to supply the information asked for. For the evening sessions the usual plan is to have a popular lecture upon some subject of general agricultural interest. This address is made somewhat more elaborate and complete than those of the day sessions, and less opportunity is given for discussion.

While the character of the institutes is such as to make it impossible to assign any definite date as the time of their differentiation from other farmers' assemblies, yet the period following the organization of the agricultural colleges under the Morrill Act of 1862 seems to have been the time when the farmers' institutes took a distinct form and under that name began to receive the patronage of the States. Thus, in 1862 the Massachusetts State Board of Agriculture held a public meeting of four days' duration, and in 1866 the Connecticut State Board of Agriculture held its first farmers' convention for lectures and discussion. In 1870 the newly organized State Board of Agriculture of New Hampshire began a series of farmers' meetings, and in the following year Vermont followed this example. During the same year the Massachusetts board requested the 29 agricultural societies of the State to organize annual meetings, to be denominated the "Farmers' Institutes of Massachusetts," and several societies began at once to hold such meetings. About the same time institutes were inaugurated in Iowa, Kansas, and Michigan by the agricultural colleges of those States. Other States soon joined the movement, and legislatures began to make appropriations to maintain the institutes. In 1885, when the board of regents of the University of Wisconsin organized a course of institutes, a special officer, called the superintendent of farmers' institutes, was appointed to plan and manage them, and this arrangement was afterward confirmed by the State.

Recent advancements under the head of farmers' institutes are the movable school that offers short courses of instruction to farmers and farm women, the young peoples' institutes, and courses of instruction adapted to correspondence teaching. The United States Department of Agriculture has collected publications and other materials for the use of farmers' institute workers and has prepared lectures illustrated by lantern slides, which are loaned to speakers or to institute organizations. In Canada the system is also highly developed. In 1913 a total of 7926 regular institutes were held in the United States, representing an aggregate of 10,578 days. In addition to the regular institutes there were 187 movable schools, 25 educational trains, nearly 800 independent institutes, and 66 "round-up" institutes. It is estimated that the total attendance at these various gatherings was practically 4,000,000 people. The funds available for farmers' institutes in the various States amounted to \$510,784. In the past 10 years there has been an increase of 115 per cent in the number of sessions held, an increase of over 300 per cent in attendance, and an increase of 175 per cent in appropriations. The interests of the institutes are pro-

moted by the American Association of Farmers' Institute Workers, and by the Office of Experiment Stations of the United States Department of Agriculture, Washington, D. C. Consult: J. Hamilton, "History of Farmers' Institutes in the United States," *United States Department of Agriculture, Office of Experimental Stations, Bulletin 174*; J. Hamilton, "Legislation Relating to Farmers' Institutes," *Bulletin 241*; and "Farmers' Institute and Agricultural Extension Work in the United States in 1913," *United States Department of Agriculture, Bulletin 83*.

FARMER'S LETTERS. A series of twelve letters, ostensibly by a farmer, which appeared in 1787. Their author was soon discovered in John Dickinson, a prominent Pennsylvanian. They were political tracts, denouncing the taxation of the Colonies by Parliament without their consent, and had great influence in shaping public opinion.

FARMING. See AGRICULTURE.

FARMINGTON. A borough in Hartford Co., Conn., 9 miles west of Hartford, on the New York, New Haven, and Hartford Railroad (Map: Conn., D 3). It is situated in a farming and fruit-growing district. The borough contains Sarah Porter's Seminary for Young Ladies. Pop., 1900, 3331; 1910, 3478.

FARMINGTON. A town and the county seat of Franklin Co., Me., 47 miles north of Lewiston, on the Maine Central and the Sandy River railroads (Map: Maine, B 4). It has the Farmington State Normal School and the Abbott School for Boys and a public library. Among the industrial establishments are machine shops, lumber and grist mills, wood-turning shops, carriage works, and canning factories. The water works are municipally owned. Pop., 1900, 3288; 1910, 3310.

FARMINGTON. A city and the county seat of St. Francois Co., Mo., 58 miles (direct) south by west of St. Louis, on the St. Louis, Iron Mountain, and Southern and the Cape Girardeau Northern railroads (Map: Missouri, F 4). Carleton Institute (M. E.), Elmwood Seminary (girls), and a State insane asylum are situated here. It is the centre of a productive lead-mining region and has carriage and wagon works, lumber mills, machine shops, flouring mills, etc. The water works and electric-light plant are owned by the city. Pop., 1900, 1778; 1910, 2613.

FARMVILLE. A town and the county seat of Prince Edward Co., Va., 53 miles (direct) west-southwest of Richmond, on the Appomattox River, and on the Norfolk and Western and the Tidewater and Western railroads (Map: Virginia, F 4). The State Female Normal School, established in 1884, is situated here, and in the vicinity is the Hampden Sidney College for Young Men. Farmville is in a fertile agricultural region, is an important tobacco-manufacturing centre, and has medicinal springs. There are plow-handle and overall factories and a creamery. The water works and electric-light plant are owned by the town. Pop., 1910, 2971.

FARNABY, or FARNABIE, THOMAS (c.1575-1647). An English schoolmaster and classical scholar, born in London and educated at Oxford. He was converted to Catholicism, and received a further classical training at a Jesuit college in Spain. He was the companion of Sir Francis Drake and John Hawkins on their last voyage, was engaged in military service in the Low Countries, and finally became

established at Martock, Somersetshire, where he opened a school which subsequently was removed to London, and there enjoyed the patronage of the aristocracy and was attended by more than 300 pupils. Many eminent clergymen and statesmen received their education here, and before 1629 the school had acquired a European reputation. Upon the outbreak of the plague in 1636 it was removed to Otford, an estate which Farnaby had bought in Kent. The publications of Farnaby include annotated editions of many Latin authors—Juvenal, Persius, Seneca (the tragedies), Martial, Lucan, Ovid, Vergil, Terence, all long popular—and a *Systema Grammaticum* (1641), or Latin grammar, written at the request of Charles I and designed to replace the one previously in use in the public schools.

FARNAM, HENRY WALCOTT (1853-). An American economist, born at New Haven, Conn. He graduated from Yale (A.B., 1874; A.M., 1876) and studied at Berlin, Göttingen, and Strassburg (R.P.D., 1878) universities. After two years as tutor he became professor of political economy at Yale College in 1880; from 1881 to 1903 he also held the corresponding chair at Sheffield Scientific School (Yale). In 1914-15 he was Roosevelt professor at the University of Berlin. He was associate editor of the *Yale Review* from 1892 to 1911, when he joined the staff of the *Economic Review*; chairman of the New Haven Civil Service Board (1898-99) and of the State Commission of Sculpture (1887-1909), and in 1903 became collaborator and in 1909 chairman of the department of economics and sociology in the Carnegie Institution. He was president of the Connecticut Civil Service Reform Association after 1901, of the American Association for Labor Legislation in 1907-10, and of the American Economic Association in 1910-11, and in 1909 became a vice president of the American Statistical Association. He published *The Economic Utilization of History* (1913).

FARNBOROUGH, fārn'bōr-ē. A town in Hampshire, England, on the Blackwater, near the Basingstoke Canal, about 33 miles southwest of London. It is famous for its strawberry gardens, cultivated for the London market. In the neighborhood is Farnborough Hill, long the residence of ex-Empress Eugénie, with the mausoleum containing the tombs of Napoleon III and the Prince Imperial. Farnborough is one of the stations for Aldershot Camp. The main depot of the British Royal Aircraft factory, in connection with the Royal Flying Corps, is at Farnborough. Pop., 1901, 11,500; 1911, 14,199.

FARNBOROUGH, LORD. See MAY, T. E.

FARNE, fārn, FEARNE, or FERN ISLES, or THE STAPLES. A group of 17 islets and rocks, some of which are visible only at low tide, 2 to 5 miles off the northeast coast of Northumberland, opposite Bamborough, England (Map: England, E 1). The largest island, Farne, or House, has an area of about 16 acres and is separated from the coast by the Fairway, 1½ miles broad. Here are the ruins of a chapel believed to mark the site of the hermitage of St. Cuthbert, who lived here for two years and returned here to die. Longstone Rock and its lighthouse are famous as the scene of Grace Darling's heroism in 1838, when the *Porfharshire* was wrecked. There are two lighthouses.

FARNELL, LEWIS RICHARD (1856-). An English archaeologist and writer on religion. He was born in Salisbury; studied at the City

of London School and at Exeter College, Oxford, of which he became fellow in 1880, classical lecturer in 1883, subrector in 1884, and senior tutor in 1893; and was University lecturer in classical archaeology, the first Wilde lecturer in comparative religion (1909), and Hibbert lecturer in 1911. His important studies on religion, especially Greek, include the epoch-making *Cults of the Greek States* (5 vols., 1896-1909), *The Evolution of Religion* (1905), and *Greece and Babylon* (1911).

FARNESE, făr-nă'să. The name of an illustrious Italian family, first mentioned in the middle of the thirteenth century, when it possessed the castle of Farneto, near Orvieto. The power of the family dates from the time of Pope Alexander VI, who was the lover of Giulia Farnese and alienated many of the lands belonging to the holy see for her benefit. In 1534 Cardinal Alessandro Farnese was raised to the papal throne as Paul III (q.v.), and as his great aim was the aggrandizement of his family, he erected Parma and Piacenza into a duchy, which he bestowed on his natural son, PIETRO LUIGI. Pietro was assassinated in 1547 by the nobles and imperialists whom he had opposed, and was succeeded by his son OTTAVIO (1520-86), who married Margaret of Austria, a natural daughter of Charles V, and the greater part of whose reign was both peaceful and prosperous.—ALESSANDRO FARNESE, Prince of Parma and Spanish Governor in the Netherlands, was the son of Ottavio and was born in 1547. After being educated at the royal court at Madrid, he entered the Spanish service, made his first campaign under his uncle, Don Juan of Austria, and distinguished himself at the battle of Lepanto in the year 1571. In 1577 he was sent with reinforcements, to Don Juan in the Low Countries, then in a state of insurrection, and contributed to the victory at Gembloux, Jan. 31, 1578. He was next made Governor of the Spanish Netherlands by Philip II and carried on the war against the Prince of Orange. By skillful diplomacy more even than by his military talents Farnese succeeded in winning back the Walloon provinces and several important towns. The assassination of William the Silent in 1584 aided his cause, and in 1585 he was able to reduce Antwerp after a memorable siege; but the project of the Armada (q.v.) interfered with his conquests in the Low Countries, and the ill success of the expedition against England, in which he had been given the command of the troops destined for the invasion of that country, grieved him the more from the contrast it presented to his former good fortune. In 1590 he was dispatched to the assistance of the Catholics in France and compelled Henry IV to raise the siege of Paris. Being, however, ill supplied with provisions and money and insufficiently supported by the League, he was forced to yield to the superior power of Henry IV and withdrew his forces. In 1591 he was once more forced to relinquish the conquest of the Netherlands and embark on a French campaign. After raising the siege of Rouen he was again compelled to withdraw. Returning, in spite of shattered health, in 1592, he died suddenly at Arras, December 2. Alexander Farnese was one of the great generals of his age and, though severe in his discipline, was almost worshiped by his soldiery.—RANUCCIO (1569-1622), his son and successor in the Duchy of Parma, was sombre, greedy, and proud. He was succeeded by his second son, ODOARDO (1612-46), a prince

remarkable for the elegance of his manners, his magnificence, magnanimity, and liberality.—ELIZABETH FARNESE (1692-1766), the daughter of Odoardo II, married, in 1714, Philip V of Spain. Of a domineering and ambitious nature, she completely ruled the King. She involved Alberoni (q.v.) in her aggressive policy, the object of which was to establish her sons, Carlos and Philip, over principalities in Italy. The male line of the Farnese family became extinct in the person of Antonio, who died in 1731.

The name of the Farnese family is connected with several celebrated palaces and works of art. The principal ones are: 1. The Farnese Palace at Rome, one of the finest specimens of Roman Renaissance architecture and one of the finest palaces in Rome, erected by Pope Paul III before his accession to the holy see, after the designs of Antonio da Sangallo. It is in the form of a quadrangle and was completed by Michelangelo. The antique sculptures for which it was formerly renowned are now in the museum at Naples; a few classic works, however, are still to be seen in the great hall. 2. The Farnesina (or Villa Farnese), a magnificent palace in Trastevere, Rome. It owes its celebrity chiefly to the frescoes of Raphael; but it also contains frescoes by Peruzzi and Sebastian del Piombo, and a colossal head in chiaroscuro, attributed to Michelangelo. 3. The Farnese Bull is the name given to a colossal group attributed to Apollonius and Tauriscus of Tralles, in Asia Minor, who probably belonged to the Rhodian school and lived about 300 B.C. The group represents Dirce bound to the horns of a bull by Zethus and Amphiion, for ill usage of their mother, Antiope. Pliny mentions the transference of the group to Rome, where it first adorned the library of Asinius Pollio and afterward the baths of Caracalla. It was discovered in the year 1546, restored by Bianchi, and placed in the Farnese Palace. 4. The Farnese Hercules, copied by Glycon from an original by Lysippus. It exhibits the hero, exhausted by toil, leaning upon his club, the head inclined, the expression melancholy; one hand is held behind his back, grasping the apples of the Hesperides.

For the early history of the Farnese family and their part in the Renaissance, consult: Symonds, *The Renaissance in Italy* (7 vols., London, 1875-86); Gregorovius, *Geschichte der Stadt Rom* (Stuttgart, 1886-96; Eng. trans., London, 1894-1900); also the works of Muratori and of the Italian biographer Strada. For Alessandro Farnese, the accounts given in Motley, *Rise of the Dutch Republic*, and id., *The United Netherlands*; Blok, *Geschiednis von het nederlandsche Volk* (Gröningen, 1892-99; Eng. trans., New York, 1898-1900); Pietro, *Alessandro Farnese, duca di Parma* (Rome, 1886); Gachard, *Correspondance d'Alessandre Farnese avec Philippe II, 1578-79* (Brussels, 1853). For the history of the dukes or princes of Parma, Scarabelli, *Storia civile dei ducati di Parma* (Piacenza, 1858); Pezzano, *Storia della città di Parma* (Parma, 1837-59); Marq. de St.-Philippe, *Mémoires pour servir à l'histoire d'Espagne sous le regne de Philippe V* (Paris, 1756); *Memoirs of Elizabeth Farnese* (London, 1796); Lita, *Famiglie celebri Italiane* (Milan, 1868); Von Reumont, *Geschichte der Stadt Rom* (Berlin, 1868); Lottice and Sitti, *Bibliografia generale per la storia parmense* (Parma, 1904). For Elizabeth Farnese, Armstrong, *Elizabeth Farnese, the Termagant of Spain* (London, 1892).

FARNESE HERCULES. A statue of Hercules, which is now in the Naples Museum. It got its name from the Farnese family, in whose possession it was for some time after its excavation at the baths of Caracalla. It dates from the first century B.C., and is an imitation, by the Athenian sculptor Glycon, of one of the bronzes by Lysippus. The statue shows Hercules leaning on his club in an attitude of exhaustion and holding the apples of the Hesperides behind him in his right hand. The muscles of the back and arms are enormous; the legs are too long, and the head unduly small, the whole effect of the statue being one of exaggeration common to this period of declining Greek art.

FARNESE JUNO. A colossal head of Hera in the National Museum at Naples, the copy of a bronze original of austere and majestic mien. The head surpasses all like conceptions of the goddess and gives a clear idea of the ideal of Polyclitus (q.v.).

FARNESIAN BULL. A group of sculpture by the brothers Apollonius and Tauriscus of Tralles, who flourished in the second century B.C. The subject is based on the legend which tells how Antiope, a slave of Dirce, was to be bound to the horns of a wild bull by order of her mistress. She fled to her sons, who seized Dirce herself and bound her to the bull. The arrangement of the group shows Zethus and Amphion, the sons, in this act, while their victim, who lies on the ground, vainly entreats mercy, and Antiope stands motionless in the background. The statue was taken from Rhodes to Rome, was there lost for several centuries, then found in the baths of Caracalla, and sent in 1786 from the Farnese Palace to the Museum at Naples. Excepting the Laocoön (q.v.), this is the most important surviving work of the sculpture of the Rhodian school, of which it is a typical example, in exaggerated sentiment as well as in ostentatious display of technical skill.

FARNESOL, făr'né-sól or -sól. A liquid alcohol contained in quassia, palmarosa, and Javanese cananga oils and in Peru and tolu balsams. It is nearly as heavy as water and can be distilled under greatly reduced pressure.

FARNHAM, făr'n'âm. A market town of Surrey, England, on the left bank of the Wey, about 37 miles southwest by west of London (Map: England, F 5). The principal feature is the stately old castle of the bishops of Winchester, first built by Henri de Blois, Bishop of Winchester, brother of King Stephen. The castle was razed by Henry III, rebuilt and garrisoned by Charles I, and restored in 1684 to its present state by Bishop Morley. A new town hall was erected in 1606. Some parts of the Gothic parish church were built in the twelfth, fifteenth, and sixteenth centuries. The edifice was originally a chapel of ease to Waverley Abbey, founded in 1128. The *Annales Waverliensis*, included by Gale in his *Scriptores*, are said to have suggested to Sir Walter Scott the name of his first novel. The town owns its water works and electric-lighting plant. The chief trade is in hops, a very fine variety of which is grown in the vicinity. William Cobbett was born and buried here, and it was the home of Hester Johnson, Swift's "Stella." The vicinity of Aldershot Camp, 3 miles northeast of Farnham, has increased the activity of the town. Farnham has belonged to the bishops of Winchester since Ethelbald of Wessex bestowed it on them in 860. Pop., 1901, 6124; 1911, 7365.

FARNHAM, or WEST FARNHAM. A town of Missisquoi Co., Quebec, Canada, at the confluence of the two main branches of the Yamaska River, 43 miles by rail east-southeast of Montreal, on the Canadian Pacific and the Vermont Central railroads (Map: Quebec, F 5). The Canadian Pacific Railway forms a junction here with various branch lines. Farnham has fine public buildings, including a spacious railway station. It contains a Roman Catholic college and convent and a hospital. Divisional shops of the Canadian Pacific Railway are located here. The industries include butter and cheese factories, builders' factories, a saw and a grist mill, tannery, furniture factory, tobacco factory, safe factory, machine shop, marble works, and sash and door factories. Pop., 1901, 3114; 1911, 3560.

FARNHAM, ELIZA WOODSON BURNANS (1815-64). An American philanthropist and author. She was born in Rensselaerville, N. Y., and married Thomas Jefferson Farnham the traveler. From 1844 to 1848 she was matron of the Sing Sing State prison. While there, she sought with much success to prove it possible to govern such an institution by kindness only. She published *Life in Prairie Land* (1846). In 1848 she was connected with the management of the Boston Institution for the Blind and some years later organized a society to aid and protect destitute women in emigration to the West. Her further publications include: *California Indoor and Out: or, How we Farm, Mine, and Live Generally in the Golden State* (1856); *My Early Days* (1859), and her most important work, *Woman and her Era* (1864).

FARNHAM, RALPH (1756-1861). A soldier in the American Revolution, the last survivor of the battle of Bunker Hill. He was born in Lebanon, Me., and was the first white settler at Acton, Me., where he died at the age of 104 years, 9 months, and 19 days. In October, 1860, he was invited to Boston, where a public concert was given in his honor in Tremont Temple.

FARNHAM, ROSWELL (1827-1903). An American lawyer and governor. He was born in Boston, Mass., and graduated at the University of Vermont in 1840. He taught school for several years, studied law, and was admitted to the bar in 1857. After serving in the Civil War as captain and colonel in a Vermont regiment, he was elected as a Republican to the State Senate in 1808. He was Governor of Vermont from 1880 to 1882.

FARNUM, DUSTIN (1876-). An American actor, born at Hampton Beach, N. H. He first appeared in 1897 with the Ethel Tucker Company in *The Hidden Hand*. After spending 18 months with Margaret Mather's company and two seasons with Chauncey Olcott, he played the part of Lieutenant Denton in *Arizona*, the title rôle in the *Virginian* (1904), and appeared as Captain Esmond in *The Ranger* (1907) and as Dr. Prince in *The Rector's Garden* (1908). He toured in *The Squaw Man* in 1909, played in *The Littlest Rebel* in 1911, and reappeared in *Arizona* in 1913.

FARNUM, WILLIAM (1876-). An American actor, brother of Dustin Farnum, born in Boston. He made his début at Richmond, Va., in *Julius Caesar*, then played in a stock company at Boston, and toured with Margaret Mather and Olga Nethersole. His success in *Ben Hur* and *The Prince of India* (1907) was noteworthy. He played in *Society and the Bull*

instructor in psychology at Columbia University, in 1901 adjunct professor of that subject, and in 1903 professor of anthropology. He was secretary of the American Psychological Association from 1895 to 1904 and president of the American Folk-Lore Society in 1903. His writings treat principally of the anthropology of American Indians.

FARRAND, Max (1869-). An American university professor and writer on historical subjects, born at Newark, N. J., brother of Livingston Farrand. He graduated from Princeton (A.B., 1892; Ph.D., 1896). Between 1896 and 1901 he was instructor, associate professor, and professor of history at Wesleyan University and between 1901 and 1908 professor at Leland Stanford Junior University. He spent one year (1905-06) as acting professor at Cornell, and in 1908 he became professor of history at Yale. Besides contributions to historical periodicals, his publications include: *Legislation of Congress for the Government of the Organized Territories of the United States, 1789-1895* (1896); *Translation of Jellinek's Declaration of the Rights of Man and of Citizens* (1901); *Records of Federal Convention of 1787* (3 vols., 1911); *The Framing of the Constitution of the United States* (1913).

FARRAR, EDGAR HOWARD (1840-1922). An American lawyer, born in Concordia Parish, La. He was educated at the universities of Virginia (A.M., 1871) and Louisiana, was admitted to the bar in 1872, and served as assistant corporation counsel and corporation counsel (1878-80). As a reformer, he actively promoted better municipal government for New Orleans, aided in the prosecution of the Mafia assassins, and had charge of the campaign which resulted in the defeat of the proposed extension of the charter of the Louisiana Lottery. He also took an active part in national Democratic politics. In 1882 he became one of the trustees of the funds used to found Tulane University. In 1906-08 he was president of the Louisiana Tax Commission and in 1910-11 president of the American Bar Association.

FARRAR, ELIZA WARE (ROTOH) (1791-1870). An American author. She was born in Flanders, while her parents were traveling in Europe, and was educated in England, where she lived until 1819. She became well known as the author of *The Children's Robinson Crusoe*, *The Story of Lafayette*, and *The Life of Howard*. *The Young Lady's Friend* (1837) also was exceedingly popular. Her later years were spent in Springfield, Mass. She married Prof. John Farrar of Harvard College.

FARRAR, FREDERIC WILLIAM (1831-1903). A distinguished English clergyman, born at Bombay, India. He studied at the University of London and at Trinity College, Cambridge, was ordained deacon in 1854 and priest in 1857. For 15 years from 1855 he was an assistant master at Harrow and from 1871 to 1876 was head master of Marlborough College. In 1876 he was appointed a canon of Westminster Abbey and rector of St. Margaret's. He became Archdeacon of Westminster in 1883, chaplain of the House of Commons in 1890, and dean of Canterbury in 1895. He was Hulsean lecturer at Cambridge in 1870, Bampton lecturer at Oxford in 1885, and in the latter year visited the United States. A popular figure among the English clergy, he was prominently connected with numerous philanthropic enterprises. His literary

work, extensive and varied, includes volumes of fiction, philological and theological studies, commentaries, biography, history, and didactic treatises, many of which gained a wide circulation. From a long list of titles may be cited: *Eric* (1858); *A Lecture on Public School Education* (1867); *Essays on a Liberal Education*, (2d ed., 1868); *Seekers after God* (1869); *The Witness of History to Christ* (1871), the Hulsean Lectures for 1870; a much-read *Life of Christ* (2 vols., 1874; 12th ed. in the same year); a *Life of St. Paul* (1879); *The Early Days of Christianity* (2 vols., 1882); *Eternal Hope* (1878; new ed., 1914), in refutation of the extreme doctrine of eternal punishment; *Darkness and Dawn*, a story of Nero's time; *The Bible: its Meaning and Supremacy* (1897), an investigation of the subject of inspiration; *The Life of Lives* (1899). Consult Farrar, *Life of F. W. Farrar* (New York, 1904).

FARRAR, făr'ar, GERALDINE (1882-). An American dramatic soprano, born in Melrose, Mass. She began her musical studies with Mrs. J. H. Long in Boston, from whom she went to Madame Thursby in New York. After further study with Trabadello in Paris and Lilli Lehmann in Berlin, she made her debut with almost sensational success as Marguerite in Gounod's *Faust* in Berlin at the Royal Opera, Oct. 15, 1901. A three-year contract was immediately offered her, and soon she was one of the prime favorites of the Berlin public. In 1906 she appeared as one of the leading sopranos of the Metropolitan Opera House of New York, and has since then been a regular member of the company. In several of the novelties she created the leading rôle. Her voice is a powerful soprano of rare beauty, although not quite flawless in coloratura passages. But for this one shortcoming she atones by her remarkable histrionic talent and subtle facial expression.

FARRE, făr, JEAN JOSEPH FRÉDÉRIC ALBERT (1816-87). A French general, born at Valence (Drôme). He commanded the pioneer corps in the army of occupation at Rome in 1859. Upon the outbreak of the Franco-German War he was director of the fortifications of Arras and after the downfall of the Empire organized the force in the northern department, which subsequently formed the divisions commanded by General Bourbaki. Farre succeeded to the chief command of the three divisions of the Army of the North on Nov. 19, 1870. Compelled to abandon his defensive position before Amiens by General Manteuffel (November 27), he was succeeded by General Faidherbe. In 1875 he was appointed general of division, and in 1879 became Minister of War, in which office he removed all prominent officers suspected of favoring the Legitimist or the Bonapartist cause; but his appointments, as well as preparations for the war against Tunis, proved so unsatisfactory that he was superseded (Nov. 14, 1881). In 1880 he was elected senator for life.

FARRELL, JAMES A. (1863-). An American corporation official, born at New Haven, Conn. Although he began life as an unskilled workman for the New Haven Wire Mills in 1878, his promotion was rapid, and soon he became a mechanic and in 1882 a wire drawer with the Oliver Iron Company, Pittsburgh, Pa. After serving this latter corporation in the further capacities of foreman and salesman, he became sales manager in 1889 and later general manager for the Pittsburgh Wire Company.

When this firm was absorbed by the American Steel and Wire Company of New Jersey in 1899, he was retained as foreign sales agent of the new concern. In 1901 he took charge of the export sales department of the United States Steel Corporation, in 1903 he became president of the United States Steel Products Company, and in 1911 he was chosen to the presidency of the Steel Trust itself. He was one of the chief witnesses in the suit of the United States against that corporation in 1913.

FARRER, ELIZABETH (c.1759-1829). A noted English actress, who became in 1797 Countess of Derby. She was the daughter of an itinerant actor named George Farren and appeared upon the stage when a child. She first appeared in London at the Haymarket in 1777, taking the part of Miss Hardcastle in *She Stoops to Conquer*. In the fall of 1778 she appeared at Drury Lane, where she became established at first in tragedy and, after the departure of Mrs. Abingdon in 1782, as leading lady in comedy. She is best known for her impersonations of fine ladies in the comedy of high life. Among her favorite parts were Clarinda in *The Suspicious Husband*, Lady Betty Modish in *The Careless Husband*, Lady Emily Gayville in *The Heiress*, Julia in *The Rivals*, and Lady Teazle in *The School for Scandal*. In this last rôle she made her final appearance April 8, 1797. She had previously been received in aristocratic society, and on May 1 of that year she was married to the Earl of Derby, who had long been devoted to her. She died at Knowsley Park, Lancashire. Boaden's remark upon her career is well known, that after her retirement comedy degenerated into farce. There is a somewhat coarse work called *Memoirs of the Present Countess of Derby, Late Miss Farren*, by "Petronius Arbitrator" (London, 1797), to which two crude responses were published by more friendly pens. Her portrait, one of the earliest and best examples of the work of Sir Thomas Lawrence, is in the Metropolitan Museum, New York. Consult: Geneste, *History of the Stage* (Bath, 1832); Doran, *Annals of the Stage*, ed. by Lowe (London, 1888); Galt, *Lives of the Players* (ib., 1831); Lowe, in *Actors and Actresses of Great Britain and the United States*, ed. by Matthews and Hutton (New York, 1886).

FARRER, WILLIAM (1786-1861). An English actor, famous especially for his acting of old men's parts in high comedy. He was the son of a prosperous actor of the same name, who lived in London, but he made his début at Plymouth, under his brother's management. For some time thereafter he lived in Dublin, till in 1818 he came to London and made his appearance at the Covent Garden Theatre, as Sir Peter Teazle. His Lord Ogleby, Sir Anthony Absolute, and Sir Andrew Aguecheek followed soon after. Having left Covent Garden in 1828, he appeared for a number of years at Drury Lane, where, in addition to some of his earlier favorites, he added the parts of Polonius, Sir Francis Gripe in *The Busybody*, Kent in *King Lear*, and numerous others. About 1840 he became one of the managers of the Haymarket, where he had occasionally played before, and there in 1843 he produced his *Old Parr*, an extraordinary depiction of old age. From 1850 to 1853 he was lessee of the Olympic Theatre. His farewell appearance was at the Haymarket in 1855. He was of distinguished appearance and unusual power of facial expression; some critics noted in him a lack of

personal sympathy, which showed itself as well in private life. Though in his later years upon the stage he was in feeble health, his success in his familiar characters seems to have been but increased. His Grandfather Whitehead was one of the parts for which his own advance in age as well as the practice of his art contributed to fit him. His sons, HENRY (c.1826-60) and WILLIAM, often referred to as Young Farren, both became well-known actors. Consult: Lewes, *On Actors and the Art of Acting* (New York, 1878); Cook, *Hours with the Players* (London, 1881); Marston, *Our Recent Actors* (ib., 1890).

FARRER, EDWARD (1850-1916). A Canadian critic and journalist. He was born in County Mayo, Ireland, was educated at the Jesuit College, Stoneyhurst, England, and later at the Jesuit College, Rome. He began to study for the priesthood, but removed to Canada in 1870 and entered journalism as an editorial writer on the Toronto *Daily Telegraph*, later joining the editorial staff of the Toronto *Mail*, the organ of the Conservative party. In succession after 1874 he was an immigration agent in Ireland, foreign editor of the New York *World*, editor in chief of the Toronto *Mail* (1882-84), editor of the Winnipeg *Times* and the *Sun*, and a member of the editorial staff of the Toronto *Globe*, from which he retired in 1892. Later he lived for a time in Washington D. C., and then went to Ottawa, Canada, in 1905, where he became correspondent for various foreign periodicals and also a magazine writer. According to expert opinion no abler editorial writer than Farrer ever appeared in the Canadian press. His articles in 1882-84 in the *Mail* and later in the *Globe* excited the strongest opposing political and religious prejudices. He assailed the Jesuits and the Catholic hierarchy with great ability and, according to some critics, with a maladroitness in which his early training gave him special advantages; while in his later efforts he aroused Loyalist anger by his support of annexation to the United States.

FARRER, HENRY (1844-1903). An American landscape painter and etcher. He was born in London, the grandson of Thomas Farrer the miniature painter, and was self-taught. He came to America in 1861 and first devoted himself to marine and landscape painting in water color. But he is better known by his etchings. The best of these are views about New York harbor, in which his treatment of sky is very successful. His brother THOMAS CHARLES (c.1838-), an English architectural and landscape painter, was born in London and studied in Ruskin's free school. He spent some time in the United States, where he was prominent as a teacher and was one of the first members of the American Water Color Society. Afterward he returned permanently to London.

FARRER, THOMAS HENRY FARRER, first BARON (1819-99). A British economist, born in London and educated at Eton and at Balliol College, Oxford (B.A., 1840). Admitted to the bar in 1844, in 1848 he entered the employment of the Board of Trade, of whose marine department he was assistant secretary in 1850-65 and secretary in 1865-86. He exerted considerable influence on the commercial legislation of his time, particularly in favor of free trade and gold-standard currency. After retiring from office in 1886 he devoted himself to the advocacy of his economic theories. From 1889 to 1898 he was a member of the London County

Council, and in 1899 he was president of the Cobden Club. He was made Baronet in 1883 and a peer in 1893. His writings include: *Free Trade Versus Fair Trade* (1882; 4th ed., 1904); *The State in its Relation to Trade* (1883; 2d ed., 1902); *Studies in Currency* (1898); *What is a Bounty?* (1899).

FAR'RIER (obsolete *ferrier*, from OF. *ferrier*, from Lat. *ferrarius*, blacksmith, from *ferum*, iron). One whose occupation is that of shoeing horses. In former times he often acted as veterinary surgeon as well as blacksmith. His vocation is one of the "common callings" and subjects him to the common-law obligation of practicing his art on demand and of discharging it with ordinary skill. For a breach of this obligation he is liable to an action for damages. He has at the common law a lien on the animal shod or treated for the labor done or expenses incurred in the course of his employment.

FAR'RINGTON, OLIVER CUMMINGS (1864-). An American geologist. He was born at Brewer, Me., and was educated at the University of Maine (B.S., 1881; M.S., 1888) and at Yale University (Ph.D., 1891), where he was tutor in 1890-91. Between 1882 and 1887 he taught science in various Maine academies, in 1893 he was an assistant in the United States National Museum, in 1894 he became curator of geology in the Field Museum of Natural History, Chicago, and from 1894 to 1904 he was lecturer on mineralogy at the University of Chicago. He was a collaborator in mines and mineralogy at the Paris Exposition in 1900 and a member of the International Jury of awards at St. Louis in 1904. Besides his magazine articles, he is author of *Observations of Popocatepetl and Ixtaccihuatl* (1897); *Meteorite Studies* (1902); *Gems and Gems Minerals* (1903); *Analyses of Iron Meteorites* (1907); *Analyses of Stone Meteorites* (1911).

FARS, fârs, or **FARSISTAN**, fâr'sê-stân' (Pers., Land of the Persians, anciently *Persis*). A province of Persia, situated along the north and east shores of the Persian Gulf (Map: Persia, E 8). The surface rises gradually from the coast to an elevation of from 2000 to 3000 feet. The valleys of this interior plateau land are well watered and exceedingly fertile. In the northwest are the mountains, the highest reaching 14,000 feet; in a basin to the east lies the large salt lake Bakhtegan. The chief rivers are the Shapur, Tab, Sefid Rud, Mand, and Bendemir. The climate is not unhealthful, except along the coast, where it is very hot in the summer. The province produces wheat, barley, rice, millet, tobacco, wine, dates, opium, linen, cotton, silk, cochineal, and roses for the manufacture of attar. The principal towns are Shiraz, the capital, and Abushehr, the principal port. About 30 miles north of Shiraz lie the ruins of the ancient city of Persepolis. The natives are dolichocephalic and represent one of the best-preserved types of the Aryan of the Iranian plateau, being fairer-skinned and more finely formed than the population generally. Pop. (est.), 750,000. See *PERSIA, Ethnology*.

FARSAN (fâr-sân') **ISLANDS**. A group of islands in the southeastern part of the Red Sea, about 35 miles off the west coast of Yemen, in lat. 16° 30' to 17° N. and long. 41° 45' to 42° 10' E. They comprise the two larger islands of Farsan Seghir, 18 miles long, and Farsan-el-Kebir, 25 miles long, with a number of islets and reefs. They are centres of important pearl

and coral fisheries, also raise and export dates. On one of the islands, Kounch, there is a coaling station belonging to Germany. Chief port, Chor Farsan.

FARSISTAN. See **FARS**.

FARTHER INDIA, or **INDO-CHINA**. The southeast peninsula of Asia. It embraces Tonkin, Annam, Laos, Cambodia, Cochinchina, Siam, Burma, Federated (and other) Malay States, and Straits Settlements proper.

FARUKHABAD, fûr'ruk-hâ-bâd', or **FUR-RUCKABAD**. A city in a district of the same name, United Provinces, British India, near the right bank of the Ganges, 87 miles northwest of Cawnpore by rail (Map: India, C 3). It is well built in a fine place, 570 feet above sea level. Potatoes, tobacco, and mangoes form its chief trade. Its manufactures include gold lace, brass and copper vessels, and calico prints. With Fatehgarh, the capital of the district, it forms a single municipality. Pop., 1901, 67,338; 1911, 59,647.

FASANO, fâ-sâ'nô. A city of Bari, south Italy, near the Adriatic, 45 miles northwest of Brindisi (Map: Italy, F 4). The city hall is a former palace, with a handsome loggia (1509), of the Knights of St. John. Two miles north of Fasano, which markets wine and oil, are the ruins of Egnatia, in Roman days a prosperous port, on the Appian Way. The ancient walls have been nearly all used by the peasants to build cottages of the modern Anazzo, and the wealth of vases, jewelry, and coins has gone to stock museums elsewhere. Pop. (commune), 1901, 16,848; 1911, 20,077.

FASCES, fâs'sêz (Lat., bundles). Bundles of rods, usually made of birch, but sometimes of elm, with an axe projecting from the middle of them, which were carried before the chief magistrates of ancient Rome as symbols of their power over life and limb. They were borne by the lictors (q.v.), at first before the kings; in the time of the Republic, before consuls and prætors; and afterward before the emperors. Their number varied; a consul had twelve and a prætor six (within the city only two). Valerius Publicola introduced a law that within the city the axe be withdrawn, except in the case of a dictator, who was preceded by 24 lictors, bearing as many fasces. The axe was withdrawn within the city limits, because there the magistrates' power to inflict the death penalty was in time nullified, since in matters of life and death an appeal to the people was always possible. Publicola also required that the fasces be lowered at the assemblies of the people as an acknowledgment of their supreme power. A general who, after a victory, had been saluted as *Imperator* (see *EMPEROR*), had his fasces wreathed with laurel; later this honor was accorded only to the emperors.

FASCH, fâsh, **KARL FRIEDRICH CHRISTIAN** (1786-1800). A German musician, the founder of the Berliner Singakademie. He was born at Zerbst, where his father was court kapellmeister. He early developed considerable musical ability, and in 1756 became cembalist to Frederick the Great at Berlin. From 1774 to 1776 he was kapellmeister of the opera in Berlin, but after that he retired and devoted himself to composition. His church music was published in six volumes (1839), and a biography of Fasch was written (1801) by his successor Zelter. For the history of the Singakademie, see *CHORAL SOCIETIES*.

FASCIA, fāsh'ā (Lat., fillet). 1. In architecture, a flat space or band, like a broad ribbon, wider than a fillet (q.v.). This name is given to the edge or face of the corona of a classic cornice or of a belt course, and sometimes to the divisions of banded architraves, such as those of the Ionic, Corinthian, and Composite entablatures. 2. In anatomy, dense connective tissue occurring in sheets which envelop muscles or groups of muscles. It has lately been found to be the site of tuberculosis near tubercular glands.

FASCIA'TION (Neo-Lat. *fasciatio*, from Lat. *fascia*, fillet). A deformity of plants, common in shoots, which become several times as broad as usual, fluted, and often curved edgewise in crozier fashion. Fasciation is especially likely to occur in rapidly growing stems which are abundantly supplied with both water and food. See MALFORMATION.

FASCINA'TION (Lat. *fascinatio*, from *fascinare*, to charm, from *fascinus*, witchcraft) BY SERPENTS. A power has long been popularly ascribed to some kinds of serpents of fascinating by their eyes the small animals on which they prey so as to prevent the escape of the intended victim, and to cause it rather to run or flutter into the mouth which is open to devour it.

As an explanation of this conduct mesmeric or hypnotic influence has been suggested, but the whole matter is now regarded as exaggerated and to a great degree fabulous. Probably when any such action occurs it should be ascribed to fear so intense that the animal becomes stupid, or loses its powers of coördination, and is "paralyzed by fright." Animals respond in just these same ways when much frightened by other causes than serpents. Thus horses and other animals when actually rescued from floods or fire have been known to rush back again to their doom, or else they are too terrified to attempt escape.

FASCINES, fās-sēnz' (Fr., from Lat. *fascina*, bundle, from *fascis*, bundle). Fagots of brushwood or similar material, bound together, with wire if possible, and used in the construction of temporary field works, construction of levees, jetties, breakwaters, preparing foundation in marshes, and sometimes for setting fire to an obstruction. The standard military fascine employed in revetting field works is a cylindrical bundle of brush, closely bound. The usual length is 18 feet and the diameter 9 inches when compressed. Lengths of 9 and 6 feet, which are sometimes used, are conveniently obtained by sawing a standard fascine into two or three pieces. The weight of a fascine of partially seasoned material will average 140 pounds. Straight pieces of brush, 1 or 2 inches at the butt, are used in the construction.

FASHER, fā'shēr, EL. See EL FASHER.

FASH'ION (Fr. *façon*, from L. *factionem*, the make of anything). The style in dress of a brief period. The distinction between it and *costume* (q.v.) is based on scale and permanency. Fashion is ephemeral and comparatively trivial.

During the season of some one of the great popular fairs held in Munich, the men and women of the Dachauer Moos and of the country around the Starnbergersee, as well as people from the Bavarian mountains, which are a part of what we call the Tyrolean Alps, appear in the city with hats, coats, decorative suspenders for their breeches, short breeches, barred and striped stockings, and conical hats; the women wearing head coverings of indescribable kind

not seen elsewhere in Europe, and an arrangement for their short black skirts, very difficult to describe, sometimes founded on a hooplike structure, not at the hips, as in the fashionable farthingales and panniers of the eighteenth century, but above them, just at the waist. Ugly as many of them are, they are ancestral, dating from old time, and in a sense unconscious—that is to say, the people of a given village have never known and do not dream of wearing garments of another style than these. This is *costume*. At the same time the ladies of Munich are wearing garments based upon the Parisian style of the same season or of the season immediately preceding, and the men of this same class of society are wearing partly English and partly French dress, the coats and trousers, hats and the rest being closely imitated from one or the other of these models. The style of these garments for both women and men varies from year to year and from season to season, not only in the shape of the garment and the fashion of its tailoring or dressmaking, but also in the material itself of which they are composed. It will be as rare at a certain time to see a black frock coat as it will be a few years later to see a blue one, and the changes in women's dress in the colors used, and even in the character and intensity of the colors, varies very greatly, usually changing slowly for a few seasons and then changing much more decidedly into a new style. This is *fashion*.

As transportation improves, commerce develops, and civilization advances, fashions tend to become world wide. The social leaders of New York and Buenos Aires, Cape Town and St. Petersburg, Berlin and even Tokyo, look to western Europe for their styles, women to Paris and men to London. But people of moderate means, not capable of indulging every fancy, follow at a slower pace, and therefore the dress of a French clerk will differ somewhat from that of an English clerk, and again from that of a man on a proportionately small salary in New York. Some few little peculiarities cling to the people of a nation or a city for a number of years, such as, for instance, the loose and long silk bow worn as a necktie, so common in the north of France, but rarely appearing in other countries except as worn by Frenchmen on their travels. These peculiarities, so far as they go, partake of the nature of costume. Some other peculiarities are merely attempts, as it were, of fashion which have failed to become universal. Thus, although American men usually wear hats of London form, there have been several epochs during the past 50 years when the London hats were very much higher in the crown and more aggressive than any of those worn in America. The changes in dress produced by the French Revolution were radical and permanent. Costumes distinctive of rank or occupation were largely abolished, and prince and peasant and pauper began to look alike. For over a century the costume of women has not deviated from waist and skirt in one or two pieces, with shawl, coat, or jacket as overgarment; and for men coat and waistcoat and trousers.

In the reign of Louis Philippe, following 1830, the frock coat was worn with skirts not very long, but cut so as to spread very widely, so that when the garment was worn buttoned it was extremely smart in appearance, fitting the body closely and having a very appropriate fullness where it covered the hips. At the same time the

dress coat worn for occasions of some ceremony, and by elderly men who felt themselves of importance in the world, had very broad skirts and was capable of being buttoned across the breast. These were the fashions in France and to a great extent in England, though the cut of the frock coat was different there. These garments were of blue, claret, bright brown, and other decided colors, and the fashion lingered on in the United States to 1850 or thereabout, at which time a person continuing to wear the colored cloth of a former generation was remarked upon. As late as 1850 many gentlemen of middle age wore a blue dress coat buttoned up with large, flat, gilt buttons, a white waistcoat, and black, close-fitting trousers, the form which had replaced the far more graceful and dignified *pantalon*; for which see **COSTUME**.

The women of 1840 and thereabout wore a very reasonable and pleasant costume. The waist of the dress was so made as to be distinctly a bodice, separate from the skirt in make, if not of a different material; the skirt was very loose and full at the top and fell in ample folds or, if of thinner material, floated softly; altogether it was a very perfectly imagined and satisfactory gown. This was the immediate successor of the close-fitting garment of the Empire mentioned under **COSTUME**. These gowns in some of their many modifications lasted until the time of the crinoline (q.v.) or haircloth skirts, which were immediately succeeded by the hoopskirts or skirts made of metal springs, all these being used to expand and support the skirt of the gown, so that the dress of women from about 1850 until 1870 was, in a sense, grotesque. It was costly and bulky, unnatural in that it did not follow the lines of the body at all, and ugly because it swung in one stiff mass instead of falling in folds, and sometimes involved disagreeable exposures. No wonder that an American woman, Amelia Jenks Bloomer (1818-94), was inspired to start her campaign for rational dress, as a result of which trousers for women have since been known as bloomers. The rational dress as she wore it had a short skirt reaching just below the knees, with long, baggy pantalettes.

After the fall of crinoline and of the Second Empire, skirts continued to be wide, with the fullness supplied by abundance of material instead of by whalebone or steel, and with frills taking the place of flounces. Waists were short and ugly, and colors and material were combined with little taste. A charming innovation in 1872 were the Pompadour or Dolly Varden pretty flowered gowns in soft, thin materials for summer and evening wear. By 1878 the so-called princess dress was in full vogue, a purely modern development, with a long skirt that had to be carried in the left hand.

Another modern development is the tailor-made gown, due primarily to the women who go in for outdoor sports. But the fashion set by them was soon followed by women generally, until at one time "smart" and "tailor-made" were terms almost synonymous. The return to outdoor life on the part of the fashionable has also had its effect on the garments of men, and for the various sports special costumes have been developed.

Recently there has been a tendency in women's costumes towards the classic on the one hand and the mediæval on the other. The mania for

daunting has eliminated unnecessary clothing, so that occasionally the follies of the Merveilleuses of a century ago seem about to be repeated. Art movements like cubism and futurism are also having a very distinct influence on fashions.

Bibliography. Hill, *History of English Dress* (London, 1893); Gessler, *Die Moden des XIX. Jahrhunderts* (Vienna, 1897); Uzanne, *Les modes de Paris* (Paris, 1898); Boutet, *Modes féminines du XIXe Siècle* (ib., 1902); Price, *Dame Fashion, 1786-1912* (London, 1913).

FASHIONABLE LIFE, **TALES OF**. A series of stories by Maria Edgeworth, of which three volumes appeared in 1809 and three in 1812.

FASHO'DA. See **KODOK**.

FASSETT, CORNELIA ADLE (STRONG) (1831-98). An American painter, born at Owasco, N. Y. She studied water-color painting in New York, oil painting in Paris and Rome under Mathieu and others, and in 1855 established in Chicago, Ill., a studio which she removed in 1875 to Washington, D. C. She was elected to the Chicago Academy of Design in 1873. Her works include portraits of President Garfield, Associate Justice S. J. Field of the Supreme Court, Clara Barton, and Gen. J. A. Logan, and the large canvas, "The Electoral Commission in Open Session" (1877-80), bought by the government for the Capitol.

FASSETT, JACOB SLOAT (1853-1924). An American lawyer and Republican politician. He was born at Elmira, N. Y., graduated at the University of Rochester in 1875, and was admitted to the bar in 1878. In 1879-80 he was district attorney of Chemung County, and in 1880-81 studied constitutional law and political economy at Heidelberg University, Germany. From 1884 to 1892 he was a member of the New York State Senate, of which he was President from 1889 to 1891. He was secretary of the Republican National Committee from 1888 to 1892, and in 1891 was the unsuccessful Republican candidate for Governor of New York. He was temporary chairman at the Republican National Convention at Minneapolis in 1892. In 1905-11 he was a member of Congress.

FAST (AS. *fæsten*, Icel. *fasta*, Goth. *fastubni*, OHG. *fasta*, Ger. *Fasten*, fast, from AS. *fæstan*, Icel. *fasta*, Goth. *fastan*, OHG. *fasten*, Ger. *fasten*, to fast; probably connected with AS. *fæst*, Icel. *fastr*, OHG. *fasti*, feste, Ger. *fest*, fast, firm). A term used to express either total abstinence from meat and drink, or at least a certain restraint in respect of food. As a religious custom fasting seems to have originated in the conceived necessity of proper preparation for communion with the ancestral spirits in the sacrificial meal and in the ecstatic state. It was thus a sacrifice offered to the divinity, the acceptance of which was indicated by permission to partake in the sacrificial banquet and by the vision vouchsafed to the devotee. Hence its universal occurrence in some form in all religions and among common worshipers as well as among the religious leaders. It has been observed wherever ancestral worship has flourished, even though there was no marked tendency towards mysticism, and has not only maintained itself, but has developed especial intensity as a means of inducing an extraordinary psychical receptivity to spiritual impressions in monotheistic and pantheistic forms of religion otherwise preserving only slight traces of their animistic origin. The reduced vitality and increased nervous excitability occasioned by lack of proper nourishment

have tended to produce a mental condition favorable to the seeing of visions and the hearing of voices, necessarily interpreted as objective realities. By curbing the appetites and the passions, they have served as means of moral discipline. On the other hand, the reaction has added joy and exhilaration to the following communion with the divinity. See FESTIVALS.

The custom prevailed among the Aztecs and Toltecs of Mexico, the Incas of Peru, and other American aborigines. It has been found among the Pacific Islanders, who occasionally use strong purges before venturing to eat holy meat. In China and Japan there are possible traces of it before contact with Buddhism, and it has been kept in eastern Asia wherever Brahmanism and Buddhism have spread. If the climatic conditions of India forced attention to dietary rules, the introspective attitude of her people naturally led to observation of the effects upon the mental activities of abstinence from food. Insensibility to pain, clairvoyance, attainment to a higher superconscious state, absorption in the divine seemed the rewards or results of a patient endurance. Already in the Yajur-Veda period this estimate of the value of fasting becomes apparent, and it is still widely prevalent in all parts of India. In the Mithras cult, a mixture of Mazdaic and orgiastic elements, it was a necessary preparation for initiation into the mysteries. As this faith spread over Armenia, Cappadocia, Pontus, and Syria the importance of the already existing religious custom was everywhere enhanced. It was indeed a characteristic requirement made by mystic cult societies in many lands. At least as early as the seventh century B.C. the Orphic societies in Greece demanded total abstinence from meat and beans, and subsequently the highest rites in the Eleusinian mysteries were preceded by a day of fasting. Similarly, fasting was required previous to initiation in the mysteries of Isis and Osiris, while in earlier times it does not seem to have been widely observed in Egypt, though it is known through Herodotus that at Busiris a fast preceded the sacrificial meal. The Romans also to some extent practiced fasting in connection with their festivals, and in later times before initiation in cult societies.

It is not certain that the Babylonians kept the custom, and the story of the fast in Nineveh (Jonah iii. 5 et seq.) merely shows that the late Jewish authors took for granted that the Assyrians fasted to avoid a great national calamity, though they may have been quite right in this assumption. In Israel fasting was, in earlier times, spontaneous and not regulated by law. The purpose appears to have been to arouse Yahweh's pity (2 Sam. xii. 22), to avert national calamity (1 Sam. vii. 6), to express sorrow for the dead (1 Sam. xxxi. 13), to prepare for a sacrificial meal (1 Sam. xi. 5), or to render a man fit for a special revelation (Ex. xxxiv. 28; Deut. ix. 9, 18). After the Exile, days of public fasting were instituted. They are first mentioned in Zech. viii. 19, where the fasts of the fourth, fifth, seventh, and tenth months are referred to and the question whether they should be observed is discussed. These fasts were ordained in commemoration of the misfortunes that had befallen Jerusalem, viz., the capture of the city on the 9th of Tammuz, the destruction of the temple on the 9th of Ab, the murder of Gedaliah on the 3d of Tishri (Jer. xli. 2), and the beginning of the siege on the

10th of Ab. The only day set apart for fasting in the Mosaic law is the 10th of the seventh month (Tishri). It is thought by modern scholars to have been instituted later than the four fast days previously mentioned. See ATONEMENT, DAY OF.

Still later is the observance of the 13th of Adar as a fast day. (See PURIM.) While the earlier prophets denounced the custom of fasting, the later prophetic writers seem to have regarded it as valuable. Prayer and fasting are often united, and the necessity of fasting as a preparation for divine revelations is emphasized (Dan. ix. 3; x. 2, 3, 12; 4 Ezra v. 13; vi. 31). The Pharisaic party practiced fasting on two days in the week, Monday and Thursday, though it is doubtful whether it ever was more than partial; the Essenes were led by their ascetic tendencies to attach much value to fasting; while the Sadducees, more conservative in such matters, did not go beyond the fast days prescribed in the law. As the Babylonian exile, rendering sacrifices impossible for a time, led to a development of fast days, so the misfortunes that in later times have befallen the Jewish people have occasioned the establishment of new fast days. These, however, have not become permanent. There are half days of fasting at the summer and winter solstices which may go back to earlier times; those before *Kosh hash-shanu*, or the New Year's Day, and the Day of Atonement seem to be later developments. Fasting is often prescribed on certain memorial days. An Orthodox Jew fasts on his birthday after reaching the age of 13, and on the birthday of his first-born son till the latter reaches the age of 13, in commemoration of the sparing of the Israelite first-born in Egypt. The anniversary of the death of parents is also similarly observed. Fasting with the Jews always implies entire abstinence and lasts from daybreak till the appearance of the first three stars, except on the Day of Atonement and the 9th of Ab, when the period begins with sunset of the preceding day. Children, pregnant women, and the sick are exempted from the observance of fasting.

In the reported sayings of Jesus, He refers only twice to fasting. In Matt. vi. 16-18, He says: "When thou fastest, anoint thy head and wash thy face, that thou be not seen of men to fast," thus condemning all ostentatious fasting, and inferentially all public display of contrition. In Matt. ix. 14-17 and parallels, He answers the question why He and His disciples do not fast. All scholars are agreed that the strikingly original utterances concerning the new wine and the old bottles and the new piece and the old garment are genuine. Assuming the authenticity also of the remarks concerning the bridegroom who is to be taken away, Roman Catholic interpreters understand, not improperly, the words, "And then they shall fast in those days," to be a direct exhortation, and that the disciples were only exempted from fasting during the presence of their Master on earth. This must indeed have been the manner in which the words were apprehended in the early Church. But the genuineness of this saying is seriously questioned by competent critics, and it is most naturally understood as a justification of a practice not observed by Jesus Himself or His disciples in His lifetime; but subsequently adopted. It seems to be earlier than the story of His fast for 40 days (Matt. iv.). These passages probably show that at the end of the first-century fasting was

quite generally observed in the Church. This is also shown by Acts xiii. 2, 3; xiv. 23; 2 Cor. vi. 5; xi. 27 and the interpolations found in the received text of Matt. xvii. 21; Mark ix. 29; Acts x. 30; 1 Cor. vii. 5. In the Oxyrhynchus fragment containing what claim to be the sayings of Jesus, He is represented as having said, "If ye fast not in respect of the world, ye shall not find the Kingdom of God." The language is probably to be taken figuratively, may be directed against physical fasting, and certainly does not come from Jesus. Fasting was required as a preparation for holy acts and feasts, for ordination and baptism. The 40 hours between Friday afternoon and Sunday morning, commemorating the time when Christ lay in the sepulchre, were annually celebrated, and early fathers allude to the 40 days of Lent as handed down and observed by the Church. The moral earnestness of the Montanistic movement found expression in vigorous fasting. (See MONTANUS.) While Wednesdays and Fridays had no doubt been observed by fasting before his time, Montanus emphasized the necessity of abstaining from all food on these days, and probably was the first to lay down definite rules concerning fasting. The growing Catholic church was led by this movement to regulate more closely the matter of fasting and to grant certain relaxations. At the Council of Orleans (541) abstinence from meat during Lent, except on Sundays, was prescribed. The eighth Council of Toledo (633) declared those who ate meat during Lent sinners unworthy to partake in the resurrection. But the severe laws on this subject which prevailed in earlier times generally, and were made still stricter in the monastic rules (the Cistercians, for example, eating nothing at all until two o'clock in the afternoon), have been much relaxed in later days as a concession to the needs of modern complexity of life and severity of climate. To regulate the details of fasting has always been considered as within the authority of the Church; in George Herbert's phrase, "The Bible bids us fast—the Church says 'how.'" Accordingly the power of dispensation is considered by Roman Catholic theologians to reside primarily and universally in the Pope, for practical purposes also in the bishops, and (for individual cases) in parish priests and confessors. Fasting is divided into the natural or absolute and total fast, which means entire abstinence from any sort of food or drink, no matter in how small quantities; the ecclesiastical or partial fast; and abstinence. The first applies only to the regulation for those who are to receive Holy Communion; it lasts from the previous midnight until after communion, and is never relaxed except in the case of the dying. The second allows only one full meal in the day, with a small collation in the evening, and two ounces of dry bread with the morning coffee or tea. The third does not regulate the quantity, but forbids the use of meat. Normally, all week days in Lent, the ember days (q.v.) at the four seasons, certain vigils (q.v.), and in some countries the Wednesdays and Fridays in Advent are observed as strict fasts under the above definition; but the regulations vary considerably in detail in different countries. The bishops of the United States are allowed to relax very much the Lenten fast for the working classes. Those who are under 21 or over 60, the insane, sick, or convalescent persons, pregnant and nursing women, and those whose occupations

are specially laborious or exhausting are excused from fasting. Strictly, the prohibition of flesh meat includes the products of the animals whose flesh is not to be eaten, as milk, butter, cheese, eggs, classed together as *lacticinia*; but in northern countries, at least, these are usually allowed, either by custom or express dispensation. The Roman Catholic church regards fasting as a means of grace, under two aspects—that of the actual mortification and that of obedience to ecclesiastical precept.

In the Greek church fasting is kept with much greater severity. The Easter fast lasts 48 days, that of Christmas 39 days, that in honor of the Virgin 14 days, and that of the Apostles begins on Monday after Trinity and extends to the 29th of June. There are also many vigils preparatory for great festivals. The Church of England considers fasting as praiseworthy, but not as obligatory, a useful exercise preparatory for the means of grace, but not itself one. The days named by the English church as seasons of fasting are the 40 days of Lent, including Ash Wednesday and Good Friday; the ember days, the three Rogation Days, all the Fridays of the year (except Christmas Day), and the eves or vigils of certain festivals.

Mohammed commanded but one fast, viz., that during the month of Ramadan (see RAMADAN), although he recommended fasting at certain other times as a meritorious act. The fast of Ramadan is rigorously observed, at least in letter, by all Moslems. Whether fasting was practiced in Arabia before contact with Judaism or Christianity is doubtful. Certain of the fasts recommended by Mohammed seem to be imitations; that on the 10th of Muharram (see MUHARRAM), for instance, corresponds to the Day of Atonement on the 10th of Tishri.

Abstinence from food may cause a grave condition of the body, and may even endanger life. In an experiment upon an animal which was caused to fast for 13 days, the more important tissues lost the following percentages of dry solid matter: the adipose tissues, 97 per cent.; the spleen, 63.1 per cent; the liver, 50.6 per cent; the muscles, 30.2 per cent; the blood, 17.6 per cent; the brain and spinal cord, none. The tissues in general became more watery than in health. As the amount of muscle lost during the fasting period contained about 15.2 grams of nitrogen, more than half the lost nitrogen came from metabolism of muscular tissue. Experience has taught that the weight of an adult's body may remain approximately constant for months or years, even under varying conditions of diet. Also, the relative proportions of the various tissues of the body remain constant, in addition to an unchanged weight. Evidently, in such cases, the expenditure of the body must precisely balance its income. If it did not lose as much nitrogen as it takes in, the body would gain in muscle. If it did not lose as much carbon as it takes in, it would put on fat. It may be losing or gaining carbon, losing or gaining fat, and yet the proteid constituents remain constant in amount, the expenditure of nitrogen being exactly equal to the income of nitrogen. This condition is called "nitrogenous equilibrium." In a fasting animal, while urea is excreted and carbonic acid is given off, the expenditure of nitrogen is very small. Glycogen and then fat disappear, and, lastly, some of the proteid. But, as the figures show, the heart and central nervous system are supported and lose but little in

weight, while other organs are sacrificed to feed them.

The results obtained from the study of fasting men differ a little from those in the case of starving animals. In men the excretion of nitrogen diminishes continuously for several days. There is a diminution of the chlorine and urea in the urine, and an increase in phenol. The respiratory quotient sinks to a figure less than the one corresponding to oxidation of fats alone. The inference must be that some of the carbon of the disintegrated proteids is stored up in the body as glycogen.

After a certain period of fasting, fever, restlessness, and delirium generally set in. The delirium may be mild, with hallucinations of food and drink, or it may be furious. Age and obesity have a considerable influence upon the length of time life persists, in the face of actual starvation. A case is recorded, of the wreck of the frigate *Medusa* in 1876, when 15 people survived without food on an open raft for 13 days. In the case of a convict, quoted by Bérard, life was sustained on water alone for 63 days. Generally death occurs after eight days of deprivation of food. Many alleged cases of fasting for 30 days, or even some years, by certain professional fasters or religious women are mere impostures. Constantly watched by physicians, the Italian Succi actually fasted for 40 days in London. March and April, 1890. He took only water, emetics, cathartics, and an opium "elixir," and smoked tobacco. Dogs live from 30 to 35 days if deprived entirely of food and drink.

Hibernating animals (see HIBERNATION) are capable of sustaining the want of food for an apparently indefinite period of weeks during the winter sleep; but no warm-blooded animal can endure fasting in anything like the same degree as the reptiles—in many of which, indeed, the natural state of existence is one of long intervals between the times of taking food, and in which the vital change of texture is remarkably slow. Thus the remarkable amphibious animal, the *Proteus anguinus*, has been known to live for years without food, and the same is true of salamanders, tortoises, and even goldfishes. In attempting the recovery of persons reduced by fasting, food must be given in very small quantities at a time, and of the most nourishing and digestible quality; stimulants should be either withheld or very cautiously administered. The most important point, sometimes even before food is given at all, is the removal of the chill of the body by gradually applied heat; for, in addition to emaciation and arrest of secretion, the animal heat falls perceptibly during fasting.

Christian Church (New York, 1904). See CALENDAR, FESTIVALS.

FAST AND LOOSE. A phrase signifying recklessness of behavior, as to play fast and loose with another's interests. It is also the name of a cheating game, called *pricking at the belt*, which appears to have been much practiced by the gypsies in the time of Shakespeare. The following is a description: "A leathern belt is made up into a number of intricate folds and placed edgewise upon a table. One of the folds is made to resemble the middle of a girdle, so that whoever shall thrust a skewer into it would think he held it fast to the table; whereas, when he has so done, the person with whom he plays may take hold of both ends and draw it away."

FASTENRATH, fäs'ten-rät, JOHANN (1839-1908). A German author, born at Remscheid. He studied at the universities of Bonn, Heidelberg, Munich, and Berlin, and in Paris; traveled extensively in Spain in 1864, 1869, and 1879; published several volumes of free renderings of both older and more modern Spanish authors (*Ein spanischer Romanzenstrauß*, 1866; *Hesperische Blüten*, 1869; *Immortellen aus Toledo*, 1869); and in *Das Buch meiner spanischen Freunde* (1870) introduced to German readers the work of contemporary Spanish poets through translations of representative specimens. His *La Wallhalla y las glorias de Alemania* (1872-87) performed a reverse service, describing for Spanish benefit, under the guise of interesting essays, prominent German characters from the days of Hermann. Numerous other original volumes and translations have in a scholarly manner familiarized in Germany much of Spanish literature and history.

FAS'TI (lat. adj., in nom. pl. masc., legal, lawful, from *fas*, divine law, sc. *dies*, days). Among the Romans, the days on which it was lawful to transact legal business before the prætor; while the *dies nefasti* were those on which courts were not in session. The *dies comitiales*, on which the assembly and the Senate might convene, were also loosely styled *fasti*. The *nefasti* embraced the *dies religiosi* and the *feriæ* (holidays). Of the strict *dies fasti* there were some 40; of the *dies comitiales*, some 190; of the *dies nefasti*, about 50; of the *dies religiosi*, some 50. There were also eight *dies interci*, which for certain hours in the forenoon and afternoon were *nefasti*, and *fasti* for the remaining hours; and there were three *dies fissi*, which were, like the *interci*, partly *fasti* and partly *nefasti*. The sacred books, in which the lawful days of the year were marked, were themselves denominated *fasti*, and the term was employed, in an extended sense, to signify various kinds of registers, which have been often confounded with one another. These registers fall into two principal divisions—the *Fasti Sacri* or *Kalendares*, and the *Fasti Annales* or *Historici*.

1. *Fasti Kalendares*, or calendars of the year, were kept exclusively by the priests for about four centuries and a half after the building of the city. The appearance of the new moon was proclaimed by a pontifex, who then announced to the people the time which would intervene between the kalends and the nones. (See KALENDS; CALENDAR.) On the nones the country people assembled for the purpose of learning from the *Res Sacrorum* the various festivals of the month and the days on which they would fall. In the same way those who intended to go to law learned on what days it would be

right (*fas*) to do so. The mystery with which this lore was surrounded, for purposes of power and profit, by the favored class was dispelled by Cn. Flavius, the scribe of Appius Claudius Cæcus, who surreptitiously copied from the pontifical book the requisite information, and published it to the people in the Forum (304 B.C.). Henceforth time-tables (*fasti*) became common, very much resembling modern almanacs. They contained the days and the months of the year, the nones, the ides, lawful and unlawful days, etc.; astronomical observations on the rising and setting of the fixed stars, the commencement of the seasons, brief notices concerning the introduction and signification of certain rites, the dedication of temples, the dates of victories, disasters, and the like. Each day was marked by a letter which showed its character; thus: N (= *nefastus*), F (= *fastus*), C (= *comitialis*). In later times the exploits and honors of the Imperial family were duly entered in the calendar. The celebrated *Fasti* of Ovid is a sort of poetical companion to the calendar for the first six months of the year, as published by Julius Cæsar, who remodeled the Roman year. Written in elegiac metre, Ovid's *Fasti* relate the origin of the festivals as told in the legends, and are important to the student of antiquities.

Several very curious specimens of *fasti* on stone and marble have been discovered, of which one of the most remarkable is the *Kalendarium Prænestinum*, the work of the learned Verrius Flaccus, which stood in the lower part of the forum of Præneste, described by Suetonius. This covers January, March, April, December, and part of February. Very interesting also are two farmers' almanacs (*menologia rustica*), now in the Museum of Naples. They are cut on four sides of a cube; each of these sides is divided into three columns, each column embracing a month. The various agricultural operations to be performed in each month are given on these curious relics, in addition to the ordinary information contained in such calendars.

2. *Fasti Annales* or *Historici* were chronicles containing the names of the consuls and other magistrates of the year, and an enumeration of the most remarkable events in the history of Rome, noted down opposite the days on which they occurred. From its application to these chronicles the word *fasti* came to be used by the poets as synonymous with historical records. A very interesting specimen of *fasti* of this class was discovered in the Forum at Rome in 1547. It is a series of inscriptions on the marble walls of the Regia, dating from 36 B.C., and containing a fairly complete register of the consuls; hence it is known as *Fasti Consulares*. The broken fragments were collected and arranged by Cardinal Alessandro Farnese and placed in the capitol, where they may still be seen, with some additional portions discovered in 1817 and 1818; for this reason they are known also as *Fasti Capitolini*. *Fasti Triumphales* gave lists of those who had been honored with a triumph; *Fasti Sacerdotales* gave lists of the priests. The fragments of the *fasti* are published in the *Corpus Inscriptionum Latinarum*, vol. vi, pt. i (Berlin, 1876). Consult: Soltau, *Römische Chronologie* (Berlin, 1889); Smith, *Dictionary of Greek and Roman Antiquities*, vol. i (3d ed., London, 1890); *Corpus Inscriptionum Latinarum*, vol. i (2d ed., Berlin, 1893 ff.); Marquardt, *Römische Staatsverwaltung* (2d ed., Leipzig, 1885); Schanz, *Geschichte der Römischen Literatur*, vol. i, § 14

(3d ed., Munich, 1907); Wissowa, "Fasti," in Pauly-Wissowa's *Real-Encyclopädie der klassischen Altertumswissenschaft*, vol. vi (Stuttgart, 1907); Costa, *I Fasti Consulari Romani* (Milan, 1910); Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912). For a drawing showing the Regia with the *fasti*, consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed., New York, 1911).

FAST'NET LIGHTHOUSE. See CAPE CLEAR.

FASTOLF, SIR JOHN (c.1378-1459). An English soldier noted for his services in France during the last phase of the Hundred Years' War. He distinguished himself at Agincourt (q.v.) and still more at the "Battle of the Herrings," Feb. 12, 1429, so called because, while conveying supplies to the English besiegers of Orléans, he formed a sort of laager of herring barrels and with his archers beat off a much larger French army. On June 18 the united forces of Fastolf and Talbot were defeated at Patay by Joan of Arc. According to Monstrelet, Fastolf displayed such cowardice that the Duke of Norfolk degraded him from the Order of the Garter, an honor which he had received in 1426. This, however, is very questionable, for he seems to have retained all his honors till his return to England in 1440. In 1441 he was granted a pension of £200. His Norfolk life is mirrored faithfully in *The Paston Letters*, where he is pictured as occupied busily in adding to his broad possessions, heaping up riches, building a huge new castle at Caister—a hard old man, yet not without some love of learning and the Church. He died Nov. 5, 1459. Attempts have been made to identify him with Shakespeare's Falstaff. Consult *The Paston Letters*, ed. by Gairdner (London, 1872-75), and Duthie, *The Case of Sir John Fastolf* (ib., 1907).

FAT. See FATS.

FAT'AL CHILDREN. A name given in early times to those children, such as Ædipus, Perseus, etc., who were expected to bring evil to their parents. In mediæval days the term referred especially to children whose mothers died at their birth. Such an event was supposed to be an augury of the future fame but early death of the orphan. Volsung in the Teutonic myth and Tristram in the Arthurian romance were two children doomed to this fate.

FATAL CURIOSITY. The name given to a well-known story contained in Cervantes' *Don Quixote*, which narrates the temptation of a wife.

FATAL DISCOVERY, THE. A play by John Home, produced by Garrick, Feb. 23, 1769, at Drury Lane.

FATAL DOWRY, THE. A tragedy by Massinger, published in 1632, but probably written a number of years earlier. It was imitated by Rowe in his *Poor Penitent*.

FAT'ALISM (from *fatal*, from Lat. *fatalis*, relating to fate, from *fatum*, fate, from *fari*, Gk. *phávo*, *phanai*, to speak, Skt. *bhā*, to shine). The doctrine that the course of events is so determined that what an individual wills can have no effect upon that course. Fatalism should be carefully distinguished from *determinism* (q.v.), as the confusion of these two conceptions has been responsible for much of the popular prejudice existing against determinism. In fact, determinism and fatalism are fundamentally antagonistic. Determinism asserts that events are determined by some of the events that immediately precede them; that if the latter were

different the former would be different. Fatalism denies that immediately preceding events have anything to do with the origination of certain events immediately following; it asserts that the latter would occur even if the former were changed. A fated event is one that does not take place according to natural law; a determined event takes place according to the natural law which determines it. Hence the futility of the attempt, e.g., to escape a fated death; for such an attempt consists always in the avoidance of the *causes* of death. But a death which would be a determined consequence of a fall from an aeroplane can be avoided by keeping to the ground. For the fatalist what actually determines the event is not another event immediately preceding, but some mysterious decree issued by some mysterious agent ages before the event. But determinism, which merely asserts that every event has its determining conditions in its immediate antecedents, may include among the determining antecedents the human will. Thus, determinism is consistent with a belief in the efficiency of will, and fatalism is not. Determinism tries to account for an act of will as well as for every other occurrence. It looks *back* from the will to its antecedent conditions. Fatalism, looking *forward* from the act of will, denies any effective consequence to it. Determinism puts the will as a link in a chain of events. Fatalism breaks the chain when human will appears. The determinist assumes that the will both counts and is to be accounted for. The fatalist declares that the will does not count.

Both fatalism and determinism, thus distinguished from each other, should likewise be distinguished from *predestinationism*. (See *PREDESTINATION*.) Calvinistic predestination is not fate, for it is carried out by the agency of natural law; or, as it is usually put, "in predestining the end God also predestined the means." Fatalism conceives of God or some other inscrutable power as decreeing the end, and then waiting till the appointed time to bring it about, whatever may be the conditions prevailing then; the means adopted are those which overbear any efforts the victim may make. The predestined victim is predestined not to thwart the use of the predestined means. Determinism, on the other hand, assumes no decree, whether of God or of fate. It is the natural development of situations and not a supernatural power that for determinism brings about the determined result. Predestination is determinism *plus* the belief in a supernatural power that established the determining natural order. Fatalism is a belief in a supernatural power that predetermines without recourse to natural order.

Fatalism has had wide currency in popular thought. It appeared among the Hebrews, the Greeks, the Romans, and is especially prevalent among Mohammedans. But in the modern Occident it has little foothold wherever science has had a controlling influence. It owed its origin to the fact that many events in man's life seem to be inevitable. This inevitableness of occurrence when there was ignorance as to the causes naturally led to a belief in an outside power that fixed events by decree.

FATAL MARRIAGE, THE; OR, THE INNOCENT ADULTERY. A tragedy by Southerne (1694), founded on Mrs. Behn's novel *The Nun*. The underplot, omitted in Garrick's revival (1757), was drawn from Fletcher's *Night Walker*.

FATA MORGANA, fā'tā mōr-gū'nā (It., fairy Morgana, who is supposed to cause the mirage). A striking kind of mirage observed in the Strait of Messina and elsewhere in Italy. A spectator on the shore sees images of men, houses, ships, etc., sometimes in the water, sometimes in the air—the same object having frequently two images, one inverted. See *MIRAGE*.

FATA MORGANA. A fairy, the sister of Arthur and pupil of Merlin, called also "Morgaine la Fée" and "Morgue la Fay," represented in Boiardo's *Orlando Innamorato* as dispensing riches from her home at the bottom of a lake.

FATBIRD. See *SANDPIPER*; *OILBIRD*; *GUA-CHARO*.

FATEHGARH. A town in the United Provinces of India, headquarters of Farrukhabad District, 87 miles northwest of Lucknow. It contains a barracks garrisoned by British and native infantry. The trade is local, and tents are manufactured. It now forms a municipality with Farrukhabad. Pop., 1901, 16,278; 1911, 12,500. Fatehgarh was fortified in 1714 and passed into the hands of the British in 1802. During the mutiny in 1857 the entire foreign population was massacred by the rebels, who besieged the town for a week.

FATEHPUR, FATHIPUR, or FUTTEHPUR, fū'tī-pūr'. The capital of the district of the same name, in the United Provinces, British India, on the great trunk road between Calcutta and Delhi, 70 miles northwest of Allahabad. (Map: India, D 3). Its chief product is whips. Besides the civil buildings of the district, it contains the small but elegant mosque of Nawab Bakār Ali Khan. Pop., 1901, 19,281; 1911, 16,939.

FATEHPUR-SIKRI, sīk'rī. An ancient capital of the Mogul Empire, India, in the Agra District, United Provinces, 23 miles east of Agra. The city is celebrated for its well-preserved remains of magnificent architectural works, among which are a mosque, with the sarcophagus of Salīm Chishtī, with a canopy of mother-of-pearl, five palaces, and a city wall 5 miles in circuit. These date from 1569 and were part of the great city of Fatehpur, built by the Emperor Akbar and his son Jehangir; but after the death of the latter the city was abandoned and the seat of power transferred to Agra. The small modern town of Fatehpur and its suburb Sikri, near the ruins, have a population, 1901, 7147; 1911, 6132. Consult E. B. Howell, *A Handbook of Agra and Taj, Sikrānda, Fatehpur Sikri, etc.* (1904).

FATES. See *PARCE*.

FATEHEAD. The most common of the bluntnosed minnows (*Pimephales promelas*), numerous all over the warmer parts of the United States. It is 2½ inches long, dusky, olivaceous, the head jet black (in the male), and a black bar across the dorsal fin; but it is highly variable.

FATHER-LASHER (apparently from *father* + *lasher*; for *father*, in this usage, compare perhaps *daddy longlegs*). A small fish (*Cottus bairdii*), the most common and spiny of the British sculpins (*Cottidae*), armed with strong spines on the back of the large head and on the gill covers. It is brown above, whitish beneath, curiously marbled and spotted, the fins marbled black and white, and repulsive in appearance; its flesh is good, but little eaten in Great Britain. When touched it distends its gill covers, sets out its spines, and assumes a very threatening appearance.

FATHER, OF ANGLING. Isaak Walton, author of *The Compleat Angler*.

OF ECCELESIASTICAL HISTORY. The name given to Eusebius of Cæsarea.

OF ENGLISH CATHEDRAL MUSIC. A name generally given to Thomas Tallis or Tallys (1515-85), organist of Waltham Abbey, gentleman of the chapel royal, and composer of *Service in the Dorian Mode*.

OF ENGLISH POETRY. A title applied by Dryden to Chaucer.

OF ENGLISH PROSE. A title given to Roger Ascham.

OF EPIC POETRY. A name given to Homer, as the author of the *Iliad* and the *Odyssey*.

OF FRENCH HISTORY. André Duchesne, one of the earliest French historians.

OF GERMAN LITERATURE. A title applied to Lessing as the leader in reviving a national German literature.

OF GOOD WORKS. Sultan Muhammed II of Turkey.

OF GREEK MUSIC. Terpander of Lesbos.

OF GREEK TRAGEDY. The title given to Æschylus.

OF HISTORY. The name given to Herodotus, as the first writer of real history.

OF JESTS. See MILLER, JOSEPH.

OF LETTERS. 1. A title bestowed on Francis I of France. 2. Lorenzo de' Medici.

OF LIES. Satan. The title has also been used of Herodotus, from disbelief in the stories he relates.

OF MEDICINE. A title given to Hippocrates.

OF MORAL PHILOSOPHY. A surname of Thomas Aquinas.

OF MUSIC. A name given to Palestrina.

OF ORTHODOXY. A title applied to Athanasius, Bishop of Alexandria, for his zeal in combating the Arian heresy.

OF PEACE. A title given to Andrea Doria by the Genoese.

OF RIDICULE. A surname of François Rabelais.

OF THE FAITHFUL. A title given to Abraham, as the ancestor of the Jewish nation.

OF THE MARSHALSEA. William Dorrit, in Dickens's *Little Dorrit*.

OF THE PEOPLE. A title assumed by the kings of Denmark and by Louis XII, Henry IV, and Louis XVIII of France.

OF WATERS. A name given to the Mississippi River, on account of its great length and numerous tributaries.

FATHER PROUT. The nom de plume of Francis Mahony (q.v.).

FATHERS, THE APOSTOLIC. The six fathers of the Church who were contemporaries of the Apostles; Barnabas, Clement of Rome, Hermas, Ignatius, Papias, and Polycarp.

FATHERS AND SONS. A novel by Turgenyev (q.v.), a presentation of theoretic nihilism.

FATHERS OF CHRISTIAN DOCTRINE. See DOCTRINE, FATHERS OF CHRISTIAN.

FATHERS OF MARY. See MARISTS.

FATHERS OF MERCY. See MERCY, FATHERS OF.

FATHERS OF THE CHURCH. A title of honor applied to the early writers of the Christian Church. The name can be traced back to the fifth century, but its early significance is sometimes complicated by the habit of applying the title of father to bishops, especially when assembled in council. Its extent is subject to question, as some refuse to apply it to those who, like Origen and Tertullian, had fallen under

suspicion of heresy. It is often, however, used of all the greater early Christian writers. When the Church, by the declaration of either a general council or a pope, has borne special testimony to the requisite qualities of orthodoxy, holiness, and eminent erudition, the formal title of "Doctors of the Church" (q.v.) is given to such writers. The limitation of the period within which the name is applied has never been very precise; most commonly it is taken to end with the death of St. John Damascene (c.754) for the Eastern church, and with that of St. Gregory the Great (604) for the Western. Consult the best general collection, Migne, *Patrologiæ Cursus Completus* (387 vols., Paris, 1844-66), with the continuation; Horoy, *Médiæ Ævi Bibliotheca Patristica, sive Patrologia ab Anno 1216 usque ad Concilium Tridentinum* (ib., 1879 et seq.); Bardenhewer, *Patrology: Lives and Works of the Fathers of the Church, translated by Shahan* (St. Louis, 1908); *Apostolic Fathers* (2 vols., New York, 1912); Lightfoot, *Apostolic Fathers* (2d ed., ib., 1912). The Vienna Academy is issuing (1866 et seq.) a *Corpus Scriptorum Ecclesiasticorum Latinorum*, of a critical character. Translations of many fathers may be found in the Ante-Nicene, Nicene, and Post-Nicene libraries (New York, 1885 et seq.).

FATHERS OF THE PIOUS SCHOOLS. See PIARISTS.

FATHER TOM AND THE POPE, OR A NIGHT AT THE VATICAN. An amusing broad satire by Samuel Ferguson, which first appeared in *Blackwood's Magazine* for May, 1838. The hero is generally supposed to have represented the Rev. Thomas Maguire, rector of a parish in Leitrim, and was afterward introduced in Lever's *Harry Lorrequer* as Father Tom Loftus.

FATHER VIOLET. See CORPORAL VIOLET.

FATHIGARRH, füt'é-gär'. See FATEHGARRH.

FATHIPUR. See FATEHPUR.

FATH'OM (AS. *fāpm*, cubit, Ger. *Faden*. fathom, *faða*, inclosure; ultimately connected with Gk. *πεταννύειν*, *petannunai*, to spread out). A measure of length equal to 6 feet. It was formerly ascertained by extending both arms and measuring to the finger tips, and this method is still used by sailors in measuring short lengths of rope. In the United States, England, and Russia the measure is applied to depth of water and length of rope.

FATHOM, FERDINAND, COUNT. See FERDINAND, COUNT FATHOM.

FATIGUE, fâ-täg' (from Lat. *fatigare*, to fatigue; probably connected with *af-fatim*, enough). Fatigue usually follows long-sustained application, whether of mind or body. The distinction is often drawn between physical or bodily fatigue and mental fatigue. There is, however, a common element in the two. The mental experience which we call exhaustion or weariness is of one and the same kind, whether caused by prolonged muscular work or by sustained thinking. But it is customary to include in physical fatigue the altered condition of the muscles which renders them, for the time being, unfit for use. Thus we say that our arm or body is tired, or that we are "tired all over." Similarly there is sometimes included in mental fatigue the laxness of "mental endeavor" and the increased inattention which follow upon hard study or the contention of diverse motives. These concomitants should, however, be kept distinct from the real experience of fatigue.

There is some disagreement among psycholo-

gists in regard to the ultimate analysis of fatigue. It is argued, on the one hand, that fatigue is a complex of more or less intensive organic sensations (q.v.), usually toned with pleasantness or unpleasantness, and even passing over into pain where the limit of endurance is approximated; while, on the other hand, it is urged that fatigue is as simple and unanalyzable as is the sensation of red or the tone of a tuning fork. The truth seems to lie between the two views. As a rule, many processes cooperate in the production of fatigue; but the experience itself is a fusion (q.v.), so close that it is hardly possible by introspection to wrench the constituent elements out of their union.

The experimental study of fatigue and of its effects, mental and physical, began with the observation of the course of exhaustion in the muscle taken from the frog's leg. When the nerve supplying the muscle was stimulated at successive intervals by an electric current, it was found that the contractility of the muscle suffered a constant decrement every time that the current was passed, until, finally, no movement at all was produced. If, however, the muscle were now thoroughly bathed with a weak saline solution, contractility was restored. This circumstance has led to the conclusion that at least part of the effect of fatigue lies in the accumulation of toxic materials, which prevent the contraction of the muscle. These materials are usually carried off in the blood, as is shown by the fact that the injection of blood from a fatigued into a normal animal gives rise in the latter to all the symptoms of exhaustion.

Over and above the action of poisonous materials, muscular fatigue is conditioned upon the exhaustion of the energy which is supplied by the blood in the form of nutriment. If dissimilation is more rapid than assimilation, the fat and even the substance of the muscle itself are gradually consumed. If, however, the consumption of energy does not exceed the supply, and if the waste products are speedily renewed by the blood, fatigue of a muscle does not ensue. The heart, e.g., beats throughout the individual's lifetime without causing fatigue. Moreover, every muscle seems to have optimal conditions for work, which include an appropriate loading and a sufficient interval for rest between contractions. Whether the feeling of fatigue is aroused by the lack of nutriment in the muscle, or only by the poisonous waste products, is not definitely known. In any event, it is necessary to pass beyond the muscle and to inquire into the immediate nervous conditions of fatigue. It is clear that a muscle could not feel fatigue apart from a nervous system. The conducting nerve fibres do not appear to be exhausted by fatigue; for they will continue to function for hours after the muscles have refused to contract. But the case is different with the nerve cells of the brain. It has been found that these cells undergo serious alterations, both during artificial stimulation by electricity and during muscular exercise. Under exhaustion the cell body becomes shriveled and the nucleus takes on a changed appearance. It is fair to suppose that these differences are directly connected with the experience of fatigue.

If a muscle is so thoroughly exhausted that it refuses to respond to a voluntary effort at contraction, it may nevertheless continue to work if it is electrically stimulated. And, on the other hand, voluntary contraction ensues when

electrical stimulation is inefficient. It is difficult, however, to draw conclusions from these cases; for in either event some new muscular element is apt to be brought into function by the new source of stimulation.

An objective measurement of the effect of muscular fatigue is afforded by the use of the ergograph, an instrument which records the amount of work that a muscle, or rather a restricted group of muscles, performs in lifting a known weight or in pulling against a coiled spring. Other instruments which are occasionally used are the dynamometer, which tests muscular strength, and the sphygmograph and pneumograph (see *PSYCHOLOGICAL APPARATUS*), which record the rate and form of the heart beat and of the respiration respectively. A method frequently employed is known as the tapping test. The observers are asked to beat time on a telegraph key, following some assigned rhythm, at whatever rate best suits them. The variation from the normal of the number and rate of the movements are then taken to measure the amount of fatigue. While, however, these methods furnish measures of muscular fatigue, they are of little value in the measurement of mental fatigue, since no correlation of the two can at present be made out. Various methods, therefore, have been devised for measuring the general intellectual fatigue which follows upon mental exertion. School children in particular have been subjected to tests for the determination of the fatigue effects of various studies. Two types of method have been employed. 1. In methods of the first type tasks are set at various periods during the school day, and the degree of fatigue is measured by the amount of work done and the number of errors made. The tasks are simple and well within the ability of the pupil: writing from dictation, simple computation, memorizing, the completion of mutilated texts, the cancellation of specified letters or words in a printed text, or, finally, combinations of these tests. The results are of value as providing some indication of the degree of fatigue at various hours of the day; but the procedure does not enable us to measure the course of fatigue step by step. To overcome this difficulty the fatiguing work itself is used as a test, and the change in the quantity and quality of the work done is taken as an index of the fatigue. In all tests of this type material should be provided which offers the same degree of difficulty, and the pupil should give equal and uniform attention throughout—two requirements which are by no means easy of fulfillment. 2. Tests of the second type also are introduced between the periods of study at various points in the day's work, e.g., at the end of every hour. The first of these methods is that of aesthesiometry. Two blunt compass points are set down near together upon the skin and gradually separated until the individual is just able to distinguish the points as two. This just discriminable difference of locality is called the *limen for localization*. (See *EXTENSION*; *PSYCHOPHYSICS*.) It has been found slowly to increase under fatigue. The attempt has also been made to measure fatigue by the degree of variation in sensitivity to pain and by the ability of the observer to estimate time intervals. Both methods, however, have proved to be unsatisfactory; the former because no agreement has been reached as to whether fatigue increases or decreases sensitivity to pain, and the latter, be-

cause the estimation of intervals is too difficult for untrained observers, especially when working under nonexperimental conditions. Indeed, in all the methods of this type, there are numerous sources of error which must be recognized and controlled if valid results are to be secured.

In the course of experiments on fatigue a number of factors have been discovered which influence the work curve, i.e., the amount or the quality of the work. The most important of these factors are (1) *practice* (q.v.); (2) *habituation*—the novelty or unpleasantness of the work soon wears off; (3) *warming up*—there is a short period, the length depending upon the individual, which must be passed through before the quantity and quality of the work reach their maximum; (4) *swing*—after the warming-up period, a stage is reached where the work is at its best, when we feel "fit," or when we have "got into the swing"; and (5) *spurt*—frequently, in the course of the work, there is an increase in efficiency which lasts for a short time, and which is the result of some newly acquired interest or of encouragement or of the fact that the end of the work is in sight. It is apparent that these factors, like all variable and accidental errors, must be either evaluated or eliminated before the results of tests can be rightly interpreted. Unfortunately, this end has not always been attained, so that results must be accepted with caution. The following conclusions are, however, generally accepted: 1. The feeling of weariness cannot be taken by itself as a criterion of fatigue; some persons are constitutionally "tired," and others never feel weariness until exhaustion is reached. Moreover, an emotion or a stimulant may banish the feeling of weariness for a time, while physiologically the fatigue is not affected. 2. There is a large individual variation in fatigability as a result of general bodily constitution, the age of the individual, climacteric periods, etc. 3. Fatigability is a function of the kind of work and the degree to which the worker has become accustomed to it, and also of such objective conditions as the temperature of the room, ventilation, etc. It follows that no single rule can be laid down whereby the degree of fatigue can be accurately determined by the individual who desires knowledge of his fatigued condition; not only must the sensations of fatigue be taken into account, but a number of other factors also, together with what previous experience has shown to be the probable aftereffects of continued work.

The word "fatigue" is used in various meanings in the psychology of sensation. Thus, in the Young-Helmholtz theory of vision (see VISUAL SENSATION) it denotes a decreased susceptibility of the retina towards light. When a red surface becomes grayish during continued fixation, the red fibre of the retina is said to be fatigued for red light and therefore to function less actively than at the beginning of stimulation. For this concept of fatigue the rival theory of Hering substitutes that of adaptation. (See AFTERIMAGES.) Fatigue is also applied, less definitely, to nervous processes in the organ of hearing. A tone, e.g., heard continuously for a long time becomes slightly less intensive. Both here and in sensations of temperature, smell, and taste, where the effect of sustained stimulation is much more noticeable, it is well to substitute the word "adaptation" for "fatigue." Even in vision the mental processes accompan-

ing decreased excitability are entirely different from the fatigue experience which we have discussed above. Consult: Mosso, *La fatigue intellectuelle et physique* (Milan, 1894); *American Textbook of Physiology*, ed. by Howell (Philadelphia, 1898); Titchener, *Experimental Psychology* (New York, 1901); Whipple, *Mental Tests* (Baltimore, 1910); Offner, *Mental Fatigue* (ib., 1911). For the method of exhaustion or adaptation in olfactometry, see SMELL.

FATIGUE. In military phraseology, the term applied to such duties of the soldier as have nothing to do with the carrying of arms. The policing of camps or quarters, e.g., is a *fatigue* duty. The *fatigue uniform*, of blue denim, is usually worn in the United States army on such nonmilitary duty, at mountain battery drills, and at "stables." *Fatigue call* is the bugle call assembling men for such work.

FATIGUE OF MATERIALS. See STRENGTH OF MATERIALS.

FATIGUE UNIFORM. See UNIFORM, MILITARY; FATIGUE.

FATIMA, fā'tā-mā. 1. The name of Mohammed's favorite daughter. 2. A character in the story of Aladdin in the *Arabian Nights*. 3. Bluebeard's last wife, the only one not murdered by him.

FATIMIDES, fāt'i-mīdz, or **FATIMITES**, -mīts. The name of a dynasty, called after Fatima the daughter of Mohammed, the prophet of Islam. She married Ali ibn Abu Talib. It is from this family that the dynasty of the Fatimides claims descent. What makes this dynasty of especial interest is that it represents the Shiite element in Islam which still claims that Ali and his two sons should have been recognized as the only legitimate caliphs of Islam. All Shiites agreed that a descendant of this family should be caliph, but, having no principle of primogeniture, there arose a great difference of opinion as to which descendant had the most legitimate claim. This difference of opinion resulted in numerous sects, one of which, the Isma'īliya, claimed that the sovereignty was vested in Isma'il, son of Jafar al-Sadik, great-great-grandson of Ali, through his second son, Hussein. Of this sect Abu Abdallah, famous as al Shii, was the first to gain a firm footing in the Maghrib among the Berber tribe of Kitama, having been invited there by one of their leaders who met him at one of the pilgrimages in Mecca. He began to make his power felt in 895 and gradually succeeded in completely undermining the power of the Aghlabides. Once his position assured, he invited Ubaidallah, who was then the leader of the Isma'īliya, to join him and be proclaimed Mahdi (Messiah). The Abbasides, in constant fear of these Shiite Mahdis, suspected Ubaidallah, watched his movements, and after numerous persecutions succeeded in throwing him into prison when he was on his way to join al Shii. He remained in the prison at Sijilmasa for three years. It was not till 909 that al Shii succeeded in setting him free and finally proclaiming him Mahdi. Enemies of the Shiites add to the doubts cast on the legitimacy of the Fatimide claims by contending that it was not the real Ubaidallah who was freed by al Shii, but a Jew who impersonated him, the real Ubaidallah having already been put to death. However this may be, a man claiming to be Ubaidallah now became the leader of the Fatimides and enforced the Shiite doctrines on the people. Not long

after this a quarrel arose between Ubaidallah and al Shii which resulted in the murder of the latter. By 913, the uprisings due to this murder having been quelled, Ubaidallah succeeded in bringing his kingdom into order. He built a new capital south-southeast of Kairawan, where he died in 933, having made two vain attempts to win Egypt from the Abbasides. His son al Ka'im and grandson Isma'il (who took the title of al Mansour) were troubled by the uprisings of Abu Yazid Makhlad al Zenati, who was not successfully defeated till 947. The rest of Mansour's reign was busied with strengthening his kingdom, which was in sad straits after his revolt. It was only on the reign of his son Abu Tamin Ma'ad, who had the title Mo'izz lidin Allah, that the authority of this dynasty began to spread. It was acknowledged over most of the region now constituting Morocco, Algeria, and Tunisia, as well as Sicily. Al Mansour also succeeded in widening his kingdom to the east, and in 972, owing to the aid of his commander in chief Jawar, he entered Cairo, thus adding Egypt to the dominions ruled by the Fatimides. This move, however, resulted in the weakening of Fatimide power in the Maghrib, which gradually became nominal only. On the other hand, numerous attempts were made to conquer Syria, but the Fatimides never gained more than a temporary hold over that country. They were finally driven out entirely by the Seljuks in 1076, Egypt at this time being the only land left to them. The two first caliphs of this period, al Mu'izz and al Aziz, insured their power by a cautious and deliberate policy and a careful organization of the mechanism of administration and finance. The third caliph, al Hakim, proved to be a powerful despot who did great harm to his country. A mystery surrounds his death. Some contend that he was murdered by his sister (who became regent after his disappearance); others that, realizing that he was losing power, he disappeared of his own accord. Thus he became in the eyes of many the Hidden Mahdi in truth, and the Druzes still look for his return. Al Hakim having, as we have said, done more harm than good, was followed by tyrannical regents and weak caliphs who succeeded in undermining the power of this once powerful dynasty. Here and there a strong man comes to the front, attempts to reestablish order, and to regain lost provinces, but for the most part this period in the rule of the Fatimides is made up of jealousies and assassinations. The result of this was that the country finally fell a prey to the two great Syrian powers, Damascus and Jerusalem. On the death of the last caliph, the unfortunate al Adid, in 1171, the Fatimide family disappeared from history, and Saladin came into the possession of Egypt.

Bibliography. Wüstenfeld, *Geschichte der fatimiden Chalifen* (Göttingen, 1880), in the preface; C. H. Becker, *Beiträge zur Geschichte Aegyptens unter den Islam*, part i, p. 4 et seq. (Strassburg, 1902), gives critical studies of the sources; cf. also Silvestre de Sacy, *Exposé de la religion des Druzes* (Paris, 1838); De Goeje, *Mémoire sur les Carmathes du Bahrein et les Fatimides* (2d ed., Leiden, 1886); Röhrich, *Geschichte des Königreichs Jerusalem* (Innsbruck, 1898); A. Müller, *Der Islam im Morgen- und Abendland*, i, 595 et seq., ii passim (Berlin, 1885-87); Stanley Lane-Poole, *A History of Egypt*, p. 92 et seq. (New York, 1905).

FATS (AS. *fat*, Icel. *feitr*, Dutch *vet*, OHG.

feizit, Ger. *feist*, *Fett*, fat). An important class of substances found in all parts of the animal organism, although they occur mainly in subcutaneous tissue and on the surface of muscles. They are largely taken in ready-formed in the food. Unlike the albuminoids, however, they are also to some extent produced by the animal organism itself. As to their mode of formation, it was for a long time believed that they are derived in the body from sugar, starch, and other carbohydrates; it has, however, been shown that they are produced by the chemical transformation of albuminoids, though the presence of carbohydrates does seem necessary to their formation. The quantity of fat in the human body varies considerably at different periods of life. In the earlier stages of foetal existence we find scarcely any fat; in new-born children there is usually a considerable quantity deposited under the skin, and the organism continues rich in fat till the age of puberty, when a marked diminution occurs. It again increases about middle life and then occasionally occurs in great excess; e.g., three or four inches of fat are not infrequently found under the skin of the abdomen of corpulent persons. Extraordinary deposits of fat in some particular part of the body are sometimes found both in men and in animals, the remarkable prominence of the buttock in Hottentot women being due to this cause. The uses of fat in the animal organism are manifold. It plays an important part in the process of cell formation; it protects the body from external shocks by a uniform diffusion of pressure through the whole adipose tissue; it checks the loss of heat by radiation; it promotes the mobility of various organs, etc. Its chief use, however, consists in supplying a great part of the heat energy indispensable to animal life, heat being produced in the organism mainly by the combustion of available fat. A moderate accumulation of fat serves as a store of combustible matter in time of need. A superfluous growth of fatty tissue, on the other hand, is a source of great inconvenience and gives rise to the condition known as obesity. See also FATTY DEGENERATION.

The fats are lighter than water; when brought into contact with paper or fabrics, they leave a translucent *grease spot*, which is generally difficult to remove, though it can sometimes be washed out with ether, benzine, chloroform, oil of turpentine, and other organic liquids in which the fats are soluble. To determine the amount of fat in milk, cheese, or any other mixture submitted for examination, the analytical chemist dissolves out the fat with ether, separates the ethereal solution from the other ingredients, evaporates it, dries the residue, and weighs the pure fat thus obtained in a suitable dish. Fats have the peculiar property of forming *emulsions* with water, in which the minute globules of fat often remain in suspension for a very long time; milk is such an emulsion. To emulsify fat artificially, it is melted, if hard, and simply shaken up with water in which some carbonate of soda has been dissolved.

Besides serving as a necessary ingredient of food, fats are applied industrially to many useful purposes. They are often used as fuel and as illuminants and very extensively for the manufacture of soap and candles. Formerly they were much used also as lubricants; in this application, however, they have been largely replaced by oils derived from petroleum.

To obtain the fat, the suet from the animal body is pressed between warm plates or kneaded in muslin bags placed in hot water; the fat melts and is readily separated from the animal membranes. Or else the fat is dissolved out with ether, in which the membranes are insoluble. Another process sometimes employed consists, on the contrary, in dissolving the membranes with dilute acid or alkali, which leaves the fat unattacked. The crude fat may be purified by treatment with sulphuric acid.

Fats are composed of carbon, hydrogen, and oxygen. Their chemical nature was elucidated by Chevreul (q.v.) as far back as 1811. Chevreul showed that fats are combinations of ordinary glycerin and certain so-called *fatty acids*. Glycerin is a triatomic alcohol; i.e., it is capable of combining with three equivalents of a monobasic acid (such as ordinary acetic acid). The combination of an alcohol and an acid is called in chemistry an *ester*, or ethereal salt. The esters of glycerin and stearic, palmitic, and oleic acids are called respectively *tristearin*, *tripalmitin*, and *triolein*. The various fats are mixtures mainly of these esters or "glycerides," containing them in varying relative quantities. Fats, like tallow, containing a large proportion of tristearin and tripalmitin are comparatively hard; on the contrary, lard and similar fats, which are soft and pasty, are found to contain a high percentage of triolein. The color, state, consistency, etc., of fats vary with the source from which they are derived. The fat of carnivorous animals has a peculiar disagreeable odor and is not so hard as that of herbivora. *Human fat* contains, besides tripalmitin, triolein, and some tristearin, also a yellow substance resembling bile by its odor and bitter taste. The animal secretions all contain a certain amount of fat; ear wax, e.g., has been shown to contain some tristearin and some triolein. *Butter* contains about 87 per cent of fat, including a considerable amount of tributyrin (the ester of glycerin and butyric acid); *oleomargarine*, prepared from the best beef tallow, differs but slightly in composition and nutritive properties from butter.

When exposed to the action of steam heated to a temperature of 400° F. (about 200° C.), all fats and fatty oils are decomposed into their chemical constituents. The same action takes place in the presence of moisture, though much more slowly, at ordinary temperatures (the rancidity of fat is due to the separation of free acids, and may therefore be removed by dissolving out the acids with water). A similar decomposition takes place in the animal organism; steapsin, one of the pancreatic ferments, splits up and emulsifies fat in the process of digestion. Even more readily than with hot steam, and at a much lower temperature, is the decomposition of fat effected with caustic alkalis. When fats are treated with sodium or potassium hydroxide, the metal takes up the acid of the fat, forming the salts known in common life as *soap*, while the glycerin of the fat is set free. The process is extensively employed in the manufacture of soap and is therefore generally spoken of by chemists as the *saponification* of fats. See *ESTERS*.

In the animal organism, or when heated with free access of oxygen, fats are burned (oxidized) completely, yielding, like other compounds of carbon, water and carbonic acid. But when they are burned incompletely, as sometimes in care-

less cooking, a number of combustible gases are produced, including the vapors of acrolein, to which the irritating odor of superheated fat is due. See *OILS*.

FATSHAN, făt'shān, or **FU-SHAN**. A great trading mart and manufacturing centre in the Province of Kuang-tung, South China, second in importance to Canton (q.v.). It is one of the five *chen*, or great marts, of the country, the others being King-te-chen in Kiang-si, Siang-t'an in Hu-nan, Hankow in Hupe, and Si-an-fu in Shen-si. It is situated on one of the branches of the river delta to the right bank of the Chu-kiang, or Pearl River, near the mouth of the North River, 12 miles southwest of Canton. It has a population estimated at 450,000. Its industries include the manufacture of cloth, silk, paper, embroideries, firecrackers, porcelain, rattan, bamboo, and brass wares; but it is especially noted for its iron and steel manufactures and has been called "the Birmingham of China." Whole cargoes of old horseshoes and old iron of all kinds are annually shipped to it from Great Britain for use in this industry. Fatshan also does a large business in cassia, grain, oil, and timber. The town is facilitating the immense traffic with Canton. It has a telegraph station, two churches, and the Wesleyan Hospital, with accommodation for 1000 patients. It is said that before the expulsion of the Jesuit and other missionaries the Christians of Fatshan numbered 10,000, but no trace of them is now to be found.

FATTORI, făt'tô-rê, GIOVANNI (1828-). An Italian military painter, born in Livorno. He was a pupil of Giuseppe Bezzuoli and the Florence Academy, and later came under the influence of the school of Morelli. The success of his first important work, "The Battle of Magenta" (1859), led him to make a specialty of military life, every aspect of which he painted. He is a naturalist as regards color and treatment of atmosphere and shows his academic training only in his correct draftsmanship and grouping of figures. In 1877 he became a professor in the Academy of Florence and a member of that of Bologna. Other paintings of his are "The Forty-ninth Regiment at Custoza" (National Gallery, Rome) and "The Wounding of Prince Amadeo at Custoza" (1870; Brera, Milan). Some few genre pictures also are from his brush, including "The Horse Market in the Piazza Montanara, Rome," and "The Horse Market in Terracina." He received a gold medal at Paris in 1900 and medals at the Vienna and Philadelphia expositions.

FATTY DEGENERATION. A pathological term signifying the gradual replacement by fat globules of the tissues of a living body, impairing and finally destroying them. These globules, though originating in the living tissues and existing among them, have in themselves no element of life; hence, when they replace living tissues, they are destructive of them. Fatty degeneration must be distinguished from obesity, which is simply excessive deposition of fat between the tissues. The disease is of frequent occurrence and attacks nearly all the tissues, particularly the muscular and cellular, as in the heart and liver, which organs are often the seats of the disease. The red blood globules and the nerves are probably never attacked by it. The older view that fat found in cellular tissue was a result of the transformation of proteid into fat is now known to be erroneous. The

chief source of the oil globules is the fat brought to the cell as nourishment by the blood and lymph and not utilized. Fatty degeneration is caused in one of two ways: (1) from a deficient supply of oxygen (seen in embolism (q.v.), thrombosis (q.v.), or anæmia, general or local); or (2) by the direct injurious action of poisons, such as phosphorus or chloroform, which act principally on the liver, or the toxin of diphtheria, which attacks the nerves and striated muscles. Injured cells containing little fat may recover; where the process has advanced beyond a certain point, recovery is impossible. Consult Mallory, *Principles of Pathological Histology* (Philadelphia, 1914).

FAUBOURG, fô'bôor' (OF. *forbourg*, from *for*, Fr. *hors*, from Lat. *foris*, outside, beyond + *bourg*, from Lat. *burgus*, OHG. *burg*, Ger. *Burg*, AS. *burh*, Eng. *borough*; formerly written also *fauw-bourg*, false town, by popular etymology). A suburb in French cities, a part of the town now indeed within the walls (or the town limits), but which was without them when, in former days, the walls were less extensive.

FAUCES, fô'sêz (Lat., throat). The back part of the mouth, consisting of the passage from the cheek cavity proper to the cavity of the pharynx. Above the fauces is the soft palate, and on either side are the pillars of the fauces, between the folds of which lie the tonsils (q.v.). See TONGUE; PALATE; PHARYNX.

FAUCHE, fôsh, HIPPOLYTE (1797-1869). A French Orientalist, born at Auxerre. After writing a theological poem, *Panthéon* (1842), and a novel, *La sœur Gabrielle* (3 vols., 1844), he devoted his life and fortune to the task of translating into French various Sanskrit works. Among these are: *Gita Govinda ou le Ritou Sanhara* (1850); *Bhartrihari et Tohaura* (1852); a part of the *Rāmāyana* (1854-58, in 9 vols.; abridgments, in 2 vols., 1869; and in 1 vol., 1892); *Œuvres complètes de Kalidasa* (2 vols., 1859-60); *Une tétrade*, containing the *Mritchakatika* of Sudraka, the *Dorakowmarat-charita*, the *Mahimnastava*, and Magha's epic *Sisoupāla-Vadha* (2 vols., 1861-63); and about a third of the *Maha-Bharata*, in 10 vols. (1863-72). These translations contain many errors, as was inevitable considering the difficulties under which he labored, but they are marked by much sympathy for the original and by frequent felicity of rendition.

FAUCHE-BOREL, bô'rêl', LOUIS (1762-1829). The principal agent of the Bourbons from the beginning of the Revolution. He was born at Neuchâtel, became a printer, conducted the negotiations with Pichegru for the restoration of the Bourbons, and for that purpose set up as a publisher at Strassburg. Here he was captured by order of the Directory in 1795, but was released for lack of evidence. After the flight of Pichegru to England Fauche-Borel continued the negotiations with Barras and was banished from France. Nevertheless he undertook to circulate the manifesto of Louis XVIII even after the accession of Napoleon to the throne. After eight years in England and Sweden he returned to France in 1814 with the allied armies and was employed in certain secret negotiations. He subsequently became Prussian Consul-General at Neuchâtel. His services were unrecognized by the Bourbons until the accession of Charles X, when he received a pension of 5000 francs. His interesting *Mémoires* were published after his death by Beauchamp (4

vols., 1828-29). Consult Barbey, "Les mémoires de Fauche-Borel," in *Revue Historique*, vol. ci, pp. 326-333 (Paris, 1909).

FAUCHER, fô'shâ', JULIUS (1820-78). A German free trader. He was born and educated in Berlin, his family being of French Huguenot extraction. He early became a disciple of Adam Smith and a defender of the policy of Cobden and the English free traders. In 1850 he founded the Berlin *Abendpost*, the first free-trade journal of Germany; and with Wiss, Beta, Prince-Smith, and others he organized in 1846 the first German free-trade society, afterward known as the Economic Society of Berlin. Upon the suppression of the *Abendpost* Faucher went to England, where in 1856 he became one of the editors of the *Morning Star*, the first free-trade paper in London. In 1861 he returned to Germany and began a vigorous agitation for liberty of domicile, industrial freedom, and free international commerce. He was elected member of the Prussian Diet in the same year. In 1863 he founded with Michaelis the *Vierteljahrsschrift für Volkswirtschaft, Politik, und Kulturgeschichte*, which he edited until 1877. During the campaign of 1870-71 he accompanied the German army as correspondent of the *London Daily News*. In 1872 he returned to London. He died in Rome. Besides contributions to economics, which appeared in the *Vierteljahrsschrift*, he published books of travel: *Ein Winter in Italien, Griechenland und Konstantinopel* (1876); *Vergleichende Kulturbilder aus den vier europäischen Millionenstädten* (1877); *Streifzüge durch die Küsten und Inseln des Archipels und des ionischen Meeres* (1878); and an essay, "Russian Agrarian Legislation in 1861," in *System of Land Tenure in Various Countries* (3d ed., 1881).

FAUCHER, LEONARD JOSEPH (LÉON) (1803-54). A French publicist and political economist. He was born at Limoges and was educated at Toulon and Paris. He became editor in chief of the *Temps*, *Courrier de Paris*, and *Constitutionnel*; was one of the principal advocates of free trade, and a frequent writer on economics in the *Siecle* and the *Revue des Deux Mondes*. After the revolution of 1848 he was elected to the Legislature and upon the election of Louis Napoleon to the presidency was appointed Minister of Public Works (Dec. 20, 1848) and soon afterward Minister of the Interior, as successor to Léon de Maleville. He retired from public life in 1851. A collection of his economic works is included in the *Mélanges d'économie et de finance*, published by the economist Wolowski, Faucher's brother-in-law (2 vols., 1856). He also wrote *Études sur l'Angleterre* (2 vols., 1844). Consult *Léon Faucher, biographie et correspondance* (2 vols., 2d ed., Paris, 1875).

FAUCHER DE SAINT-MAURICE, fô'shâ' de sâ'n' mô'rê's', NABOISSE HENRI EDOUARD (1844-97). A French-Canadian journalist and author. He was born at Beaumont, Bellechasse, in the Province of Quebec, was educated at the seminary there and at the College of Ste. Anne de la Pocatière, and in 1864 went to Mexico, where he became captain in the army of Maximilian and afterward aid-de-camp to Gen. Viscount d'Hurbal. For valor and integrity he was created a knight of the Imperial Order of Guadeloupe by Maximilian and was given the medal of the Mexican campaign by Napoleon III. Returning to Quebec in 1866, he was appointed clerk of the Legislative Council of the Province of Quebec—a post which he held for 14 years.

As editor of *Le Journal de Québec* (1883), and subsequently of *Le Canadien*, he had a brilliant career in journalism. For his services to France in the Canadian press he was created a chevalier of the Legion of Honor (1881). In general literature Faucher is best known for his sympathetic descriptions of historical places along the St. Lawrence. Among his separate publications are: *A la brunante, contes et récits* (1873); *De Québec à Mexico* (1866); *Choses et autres* (1873); *De tribord à bâbord: trois croisières dans le golfe du Saint-Laurent* (1877); *A la veillée* (1878); *Deux ans au Mexique* (1878); *En route: sept jours dans les provinces maritimes* (1888); *Joies et tristesses de la mer* (1888); *Loins du pays* (1889).

FAUCIT, fə'sit, HELENA SAVILLE (1817-98). An English actress, born in London. She was the daughter of an actor, John Saville Faucit, and made her début as Juliet, at Richmond, in 1833, winning at once a great reputation. She became the leading lady in Macready's Shakespearean revivals, was the original impersonator of the heroines in Bulwer's, Browning's, and other modern plays, and also supported Irving (1857). After her marriage in 1851 to Theodore Martin, afterward Sir Theodore, she continued occasionally to appear on the stage, though later than 1864 she rarely did so except for a charitable object. One of her last appearances was as Beatrice at the opening of the Shakespeare Memorial Theatre at Stratford in April, 1879. She was the friend of many noted people and a reader to Queen Victoria. In 1887 she published *On Some of the Female Characters of Shakespeare*. Her death occurred near Llangollen, Wales. Consult *Actors and Actresses of Great Britain and the United States*, ed. by Matthews and Hutton (New York, 1886), and Sir Theodore Martin's *Helena Faucit* (London, 1900).

FAUJAS DE SAINT-FOND, fə'zha' de sən'fon', BARTHÉLEMY (1741-1819). A French geologist and paleontologist, born at Montélimar. As an expert geologist he was sent as commissioner of the King on extensive travels for the purpose of making an especial study of the products and phenomena connected with volcanoes. He was professor of geology at the Jardin des Plantes, Paris, from 1793 to 1818. His works include: *Recherches sur la pouzzolane* (1778); *Recherches sur les volcans éteints du Vivarais et du Velay* (1778), in which he formulates a new volcanic theory; *Histoire naturelle de la province de Dauphiné* (4 vols., 1781-82); *Minéralogie des volcans* (1784); *Voyage en Angleterre, en Ecosse et aux Hébrides* (2 vols., 1797; Eng. trans., 1799, and new ed., 1907); *Essai de Géologie* (2 vols., 1803-09).

FAULKNER, fə'k'nər, CHARLES JAMES (1806-84). An American lawyer and politician. He was born in Martinsburg, Va. (now West Virginia), was educated at Georgetown University, and was admitted to the bar in 1829. In 1832 he was elected to the Lower House of the Virginia Legislature. In 1848 he introduced in the Virginia House of Delegates a law after which the Fugitive Slave Law of 1850 was modeled. From 1851 to 1859 he was a member of Congress from Virginia. In 1859 he was appointed by President Buchanan Minister to France, where his action in influencing Louis Napoleon to favor the Confederacy led to his recall by President Lincoln in 1861. Upon his return to the United States he was arrested and confined in Fort

Warren, Boston harbor. When released, he went south and served in the Confederate army on the staff of Stonewall Jackson. After his political disabilities were removed, in 1872, he was a member of the State Constitutional Convention in West Virginia in that year and was again a member of Congress from 1875 to 1877.

FAULKNER, JOHN ALFRED (1857-). An American church historian. He was born at Grand Pré, Nova Scotia, graduated at Acadia College, 1878, at Drew Theological Seminary, 1881, studied at Andover and Leipzig, and, after several pastorates, became professor of church history at Drew, 1897. He contributed to Hurst's *History of the Christian Church* (1897-1900) and wrote: *The Methodists* (1903); *Cyprian* (1906); *Erasmus* (1908); *Crises in the Early Church* (1912).

FAULMANN, foul'män, KARL (1835-94). An Austrian stenographer and author, born at Halle, Germany. He began to teach the Gabelsberger system in 1861, was member of a commission appointed to investigate the teaching of stenography in 1868, and was made a professor of stenography in 1884. He edited several stenographic journals and invented a system of phonography (published by Brant in 1875). Based upon a radical reform of the Gabelsberger system, it is easy of comprehension, but less pliable and characteristic than the system it aims to supplant. It has been adapted to the French, Czech, and Servian languages. The principal works of Faulmann are the following: *Lehrgebäude* (35th ed., 1899); *Anleitung zur phonetischen Stenographie* (6th ed., 1896); *Die Phonographie in ihrem Verhältnis zur Kurrentschrift und Stenographie* (1878); *Das Buch der Schrift* (2d ed., 1880); *Geschichte und Litteratur der Stenographie* (1895).

FAULT (OF., Fr. *faute*, Sp., Portug., It. *falta*, Slav, from Lat. *fallere*, to deceive, Gk. *σφάλειν*, *sphallein*, to slip, Skt. *phal*, to deceive, Lith. *pulti*, OHG. *fullan*, Ger. *fallen*, Icel. *valla*, AS. *feallan*, Eng. *fall*), or **DISLOCATION**. In geology, a displacement of rocks along a plane of fracture. The plane of fracture may be inclined at any angle to the horizon, and the displacement may be vertical or horizontal, but usually both. The angle made by the fault plane with a vertical plane is called the "hade" or "slope" of the fault. The inclination of the fault plane with the horizontal plane is called the "fault dip." Where the displacement is partly vertical, the side on which the rocks lie at a higher level than that of their continuations across the fracture is called the "upthrown side,"

SECTION SHOWING FAULTS.
a, normal fault; b, reversed fault.

and the other is called the "downthrown side." Also the side towards which the fault plane dips is called the "hanging wall," while the other side is called the "footwall." The "throw" of a fault is its vertical displacement. The horizontal displacement is sometimes called the

"heave." Where the hanging-wall side of a fault is depressed with reference to the footwall side, the fault is said to be a *normal* or *gravity* fault. Where the hanging-wall side is thrust up over the footwall side, the fault is said to be a *reversed* or *thrust* fault. In a gravity fault the dip of the fault plane is usually great; in a thrust fault, small. This displacement in normal faults is due to gravity and causes the affected bodies to occupy greater horizontal area. The displacement of a thrust or reversed fault originates in compression of the rock mass.

In general, faults are one of the manifestations of the deformation which rocks undergo in the outer parts of the earth's crust where they yield by fracture. (See CRUST OF THE EARTH.) Faults are accompanied by various phenomena such as brecciation, jointing (see JOINTS), and slickensiding, which are the common accompaniments of relief from pressure. While faults with marked throws are not very frequent, it is difficult to find a fracture in the earth's crust where some slight displacement of the parts has not occurred, for fractures develop in the relief of rocks from pressure, and relief cannot be obtained without at least a slight differential movement. In mountain masses the displacement by faulting may amount to hundreds, or even thousands, of feet. The development of such great faults has resulted probably from repeated small movements along the fault fissures rather than by single displacements. The movement, when sudden, is accompanied by earthquakes, and it is now known that faulting is the proximate cause of most of the powerful earthquakes, e.g., such as the more recent disturbances in India, California, and Messina. Consult "Report of the Committee on the Nomenclature of Faults," *Bulletin of the Geological Society of America*, vol. xxiv (Washington, 1913). See MOUNTAIN; GEOLOGY.

FAUNA. An ancient Italian divinity. See FAUNUS.

FAUNA. The indigenous animals of a designated place, region, or space of time, considered collectively—the correlative of "flora" (q.v.). The space in view may be a geographical surface, as a country or a certain neighborhood, or it may be a certain environment. Moreover, the word is frequently compounded, as "avifauna," "piscifauna," etc., in order to designate that only the birds, fishes, or other single group of the given region are under consideration. Conversely, a district characterized by a fauna of any particular nature is spoken of as a "faunal region." For further elucidation of these definitions, see DISTRIBUTION OF ANIMALS.

In geology and paleontology the term is employed in a sense somewhat different from that in which it is used by the zoölogist. The paleontologist conceives of a "fauna" as an assemblage of animals inhabiting a particular region during a geologic hemera, epoch, or period. The fossil remains of such a fauna would be found scattered through the successive layers of all the deposits formed during the period of its existence. Such a fossil fauna undergoes changes in its make-up; some species drop out, other new ones come in from adjoining provinces, and the species themselves often exhibit evolutionary changes. The broader the use of the term, the more apparent the modifications of the fauna. Thus the "Ordovician fauna" of New York State is a comprehensive use of the term and involves

a large, heterogeneous assemblage of fossil organisms; but the "Upper Chazy" fauna of the Champlain valley is a more restricted use and refers to a concrete, homogeneous member of the larger group. For further discussion, see PALEONTOLOGY.

FAUNCE, DANIEL WORCESTER (1829-1911). An American clergyman, father of William H. P. Faunce, born at Plymouth, Mass. Graduating from Amherst College in 1850, he then studied at the Newton Theological Institution, was ordained to the Baptist ministry in 1853, and thereafter held charges from 1853 to 1866 in Somerville, Worcester, and Malden—all in Massachusetts—in Concord, N. H. (1866-75), Lynn, Mass. (1875-81), Washington, D. C. (1881-89), West Newton, Mass. (1889-93), and Pawtucket, R. I. (1894-99). He was a member of the board of managers of the American Baptist Missionary Union. His works include: *Words and Works of Jesus* (1873); *Words and Acts of the Apostles* (1874); *The Christian in the World* (1875); *A Young Man's Difficulties with his Bible* (1877); *The Christian Experience* (1880); *Hours with a Sceptic* (1889); *Prayer as a Theory and a Fact* (1890); *Advent and Ascension* (1893); *Shall We Believe in Divine Providence?* (1900); *The Mature Man's Difficulties with his Bible* (1908).

FAUNCE, WILLIAM HERBERT PARRY (1859-). An American clergyman and educator, born at Worcester, Mass. He graduated in 1880 at Brown University (where he then taught mathematics for a year), and in 1884 at Newton Theological Seminary, and from 1884 to 1889 was pastor of the State Street Baptist Church of Springfield, Mass. From 1889 to 1899 he was pastor of the Fifth Avenue Baptist Church of New York City, in 1896-97 he lectured in the Divinity School of the University of Chicago, and in 1898-99 he was a member of the board of resident preachers of Harvard University. In 1899 he became president of Brown University; during his administration the endowment of the university was largely increased. He was Lyman Beecher lecturer at Yale in 1907-08 and was prominent in the work of the Religious Education Association. His writings include numerous contributions, chiefly to religious periodicals, and the volumes *The Educational Ideal in the Ministry* (1909) and *What Does Christianity Mean?* (1912).

FAUN OF PRAXITELES, THE. The usual designation of a marble statue in the Capitoline Museum, Rome. It is a copy of a celebrated bronze original by Praxiteles (q.v.), which stood in the street of the tripods in Athens. The figure is, properly speaking, a satyr, who is represented leaning in an easy and graceful position against the trunk of a tree. This is probably the first instance in Greek sculpture in which a satyr is represented without any animal attributes except the pointed tips of the ears. This figure suggested the title of Hawthorne's *Marble Faun*, in which a subtle description of the statue is given.

FAUNUS. Faunus is an early Italian god of the country and especially of life on the farm; a god of fruitfulness in fields and flocks, a kindly divinity (the name may well be derived from Lat. *favere*, to favor). He dwelt in the hills and the woods and was worshiped there. He was also gifted with prophecy, and to him were attributed the strange voices and sounds heard in the woods. His companion divinity was

the goddess Fauna, his wife or his sister. This old Roman god was identified by Roman poets with the Greek Pan and under the influence of Greek models assumed the form and attributes of that deity. From this also developed the conception of fauni, or fauns, creatures like the Greek satyrs, with pointed ears, goats' hoofs and tails. In art the later Greek conception minimized the goat nature. Under the euhemeristic tendencies of the time Faunus entered the list of the early Latin kings as the father of Latinus, son of Picus, and representative of the early civilization. In some of the villages a festival in honor of Faunus, called Faunalia, seems to have been held on December 5, but in Rome the great festival of the *Lupercalia*, (q.v.), on February 15, was celebrated in his honor. In the country wine and milk were offered to him, and he was implored to be gracious to fields and flocks. Consult Horace, *Carmina*, iii, 18, and Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

FAUQUE DE JONQUIÈRES, fok de zhōN'-kyâr', JEAN PHILIPPE ERNEST DE (1820-1901). A French mathematician and naval officer, born at Carpentras. As chief of staff to Admiral La Grandière in Cochinchina, he organized at Saigon the first agricultural and industrial exposition in the French Asiatic possessions. He was appointed vice admiral Oct. 1, 1879, and in 1883 became director of the Bureau of Charts and Plans. His mathematical works include: *Mélanges de géométrie pure* (1856); *Essai sur la génération des courbes géométriques* (1859); *Théorèmes fondamentaux sur les séries de courbes et de surfaces algébriques, etc.* (1865). He also translated into French the *Epistles* and the *Art of Poetry* of Horace.

FAUQUIER, fā'kwâr', FRANCIS (c.1704-68). A Colonial governor of Virginia. He succeeded Dinwiddie as Lieutenant Governor of Virginia in 1758 and retained this office until his death. In 1765, upon the passage of Patrick Henry's famous Stamp Act resolutions, he dissolved the Virginia House of Burgesses. He also opposed the assembling of the Stamp Act Congress and by refusing to summon the newly elected House of Burgesses prevented the Colony of Virginia from choosing delegates in compliance with the invitation of Massachusetts. Fauquier was not unsympathetic with the colonists in their struggle for self-government and did not come into violent conflict with them as Dinwiddie did. He published *An Essay on Ways and Means of Raising Money for the Support of the Present War, without Increasing the Public Debts* (1756).

FAURE, fôr, (FRANÇOIS) FÉLIX (1841-99). A French statesman, President of the French Republic from 1895 to 1899. He was born in Paris, the son of a cabinetmaker, studied in a Christian Brothers' School in Paris, and in an English school in Surrey. He learned the trade of a tanner, and removed (about 1862) to Havre, where he entered the employ of a large leather firm, of which he became the controlling partner. He was president of the Chamber of Commerce at Havre on the breaking out of the Franco-Prussian War, through which he served as a captain in the Garde Mobile. In 1881 he first entered politics, being elected to the Chamber of Deputies from Havre as a moderate Republican, and was chosen Undersecretary of State for Commerce and the Colonies in the Gambetta cabinet until January,

1882. He held the same position in the cabinet of M. Ferry in 1883-85. In the Chamber of Deputies he became the chief spokesman of the group known as Union Republicans. In the short-lived cabinet of M. Tirard (January to February, 1888), he was for the third time Undersecretary for Commerce and the Colonies. He continued to serve in the Chamber of Deputies, being elected its Vice President in 1893. Upon the election of Casimir-Périer to the presidency in 1894, Faure became Minister of Marine in the cabinet of M. Dupuy. When Casimir-Périer suddenly resigned the presidency in January, 1895, Faure was elected his successor as a compromise candidate, the moderate Republicans blocking the choice of Brisson (who got 338 votes to Faure's 224 on the first ballot) and the Radicals preventing the election of Waldeck-Rousseau (who had 184 votes), who threw his strength to Faure to defeat Brisson.

Faure was not a great statesman, and his career as president was not brilliant, but he was conservative and safe. His administration was a quiet one. The Franco-Russian alliance was the only step of any importance in the Republic's foreign relations, and the unfortunate Fashoda affair was happily terminated. In 1898 his opposition to the agitation for a retrial of Dreyfus caused considerable feeling. Faure himself as President assumed an almost monarchical pomp; and his wife took official rank—the first time under the Republic. He was stricken with apoplexy, and died on Feb. 16, 1899. There is little reason to believe the stories in the *Mémoires* (1912) of Madame Steinhilf that she was the President's intimate friend. Faure's *Les budgets contemporains* (1887) received a prize from the French Academy.

FAURÉ, fû'ra', GABRIEL URBAIN (1845-). A French composer, born at Pamiers. He studied in Paris under Niedermeyer, Dietrich, and Saint-Saëns, and began his career in 1866 as organist at Rennes. In 1870 he went to Paris as assistant organist at Saint-Sulpice. Later he became organist at Saint-Honoré, and in 1896 at the Madeleine. In the same year he succeeded Massenet as professor of composition at the Conservatory. Upon the resignation of Dubois in 1905 he became the director. In 1909 he succeeded to Reyer's seat in the Académie. Twice, in 1885 and 1893, he won the much-coveted Prix Chantier for chamber music. His compositions include a symphony in D minor, a violin concerto, an orchestral suite, an elegy for violoncello and orchestra, a requiem, a choral work (*La naissance de Vénus*), incidental music to several dramas (*Caligula*, *Shylock*, *Pelléas et Mélisande*, *Prométhée*), an operetta (*L'Organiste*, 1885), and an opera in three acts (*Pénélope*, 1913). But his talent is shown to best advantage in his chamber music (a sonata for violin and piano, several quartets and quintets). Among his numerous songs are many of rare excellence.

FAURE, JEAN BAPTISTE (1830-1914). A French barytone and composer, born at Moulins. When 13 years old, he entered the Paris Conservatory and became a chorister at the Madeleine, where his instructor was Trévaux. After having won first prize in the comic-opera class at the Conservatory, he made his professional début at the Opéra Comique in 1852. His first triumph came in 1857, and two years later Meyerbeer wrote for him the rôle of Hoël in the *Pardon de Ploërmel*. In 1861 he appeared at the Grand

Opéra, and his subsequent career was a repetition of successes. In 1857 he had become a professor at the Conservatory. For a time he sang in London and in Germany, but in 1876 left the opera and thereafter appeared only in concerts. In 1881 he was made a chevalier of the Legion of Honor. As a composer, Faure was well known for his sacred songs, many of which largely owed their popularity to his interpretation. In 1886 he published *La Voix et le Chant*, a treatise, with numerous exercises, on vocalization.

FAURIEL, fô'ryél', CLAUDE CHARLES (1772-1844). A French philologist, historian, and critic, born at Saint-Etienne. From 1830 until his death he was professor of foreign literature at the Sorbonne. In 1836 he published his chief work, *Histoire de la Gaule méridionale sous la domination des conquérants germains* (4 vols.), which constituted a section of an extensive projected history of culture and literature in France. Worthy of notice, also, particularly on account of its historical introduction, is his edition of the Provençal rhymed chronicle, entitled *Histoire de la croisade contre les hérétiques albigeois* (1837). After his death there appeared two collections of his lectures, *Histoire de la poésie provençale* (1846) and *Dante et les origines de la langue et de la littérature italiennes* (2 vols., 1854). His works served to stimulate the study of the literature of the Middle Ages, though his learning is frequently more extensive than exact. Consult J. B. Galle, *Claude Fauriel* (Saint-Etienne, 1909), and also *Correspondance de Fauriel et Mary Clarke* (Paris, 1911).

FAUSBÖLL, fous'bél, MICHAEL VIGGO (1821-1908). A Danish philologist and Pāli scholar, born at Hove, near Lemvig. In 1861 he received an appointment in the library at Copenhagen, and in 1878 he was made professor of Indo-Oriental languages in the University. He died in Copenhagen on June 3, 1908. His chief work was in the editing of Pāli texts and in thus spreading a knowledge of the Buddhist sacred books. Among his important publications are: *The Dhammapadam*, with a translation and commentary in Latin (Copenhagen, 1855; 2d ed., London, 1900); *Five Jātakas*, with English translation (1861); *Two Jātakas* (1870); *Dasaratha Jātaka* (1871); *Ten Jātakas* (1872); *The Jātakas*, with an English commentary in 6 vols. (London, 1877-96); *Indian Mythology according to the Mahābhārata* (1903). He wrote also many works under the pseudonym of V. Kristiansen, among which the *Dictionnaire de la langue des rues* (1866) may be mentioned.

FAUSSET, ANDREW ROBERT (1821-1910). A biblical scholar of the Church of England, born at Silverhill, Ireland. He graduated at Trinity College, Dublin, in 1843, became rector of St. Cuthbert's, York, England, in 1859, and canon of York in 1885. With Robert Jamieson and David Brown he prepared a commentary on the whole Bible entitled *The Library Commentary* (London, 1868); separately he issued the well-known *Horæ Psalmicæ* (1877; 3d ed., 1885); *The Englishman's Critical and Expository Bible Cyclopædia* (1879; 3d ed., 1891); *Signs of the Times* (1896).

FAUST. An opera by Gounod (q.v.), first produced in Paris, March 19, 1859; in the United States, November 18, 1863 (Philadelphia).

FAUST, foust, ALBERT BERNHARDT (1870-). An American Germanic scholar. He was

born at Baltimore, Md., and was educated at Johns Hopkins (A.B., 1889; Ph.D., 1892), where he was an instructor in German in 1894-96. For the next seven years he was associate professor of German at Wesleyan University (Connecticut). He was assistant professor of German at the University of Wisconsin (1903-04) and at Cornell University (1904-10) and after 1910 held a full professorship at the latter institution. He edited *Zschokke's Tales* (1895) and *Heine's Prose* (1909). Besides several essays on German literary subjects, he is author of *Charles Sealsfield* (Carl Postl), *Der Dichter beider Hemisphären* (1897), and *The German Element in the United States* (1909; Ger. trans., 2 vols., 1911), for which he was awarded prizes by the University of Chicago and the Royal Prussian Academy.

FAUST, BERNHARD CHRISTOPH (1755-1842). A German physician. He was born at Rotenburg, Hesse, was educated at Göttingen and Rinteln, and in 1788 became physician in ordinary at Bückeburg. He was one of the first physicians in Germany to adopt vaccination and published on that subject: *Ueber die Kuhpocken und deren Impfung* (1801) and *Öffentliche Anstalten, die Blattern durch Einimpfen der Kuhpocken auszurotten* (1804). The most important of his numerous hygienic works is the *Gesundheitskatechismus zum Gebrauche in den Schulen und beim häuslichen Unterricht* (1794, and frequently republished). Of the three English translations of the work, the latest is entitled *A New Guide to Health, Compiled from the Catechism of Dr. Faust* (1832).

FAUST, or **FAUSTUS**, JOHANN, or GEORG (c.1485-c.1540). A German charlatan, astrologer, and soothsayer, supposed to have lived in the first half of the sixteenth century and to have performed marvels by the aid of the devil and to have been carried away by him at his death. Philip Begardi, a physician, mentions such a person in his *Index Sanitatis* published at Worms in 1539. The tales gathering about such a nucleus made their first appearance in literature as *Historia von Dr. Johann Fausten* at the book fair at Frankfurt-on-the-Main in 1587. This relates how the son of a peasant achieves distinction at the University of Wittenberg, but seeks to deepen his knowledge by magic arts, secures a devil, Mephistopheles, for his servant for 24 years, after which Faust is to belong to the devil. This compact is sealed in Faust's blood. The devil amuses Faust and his professorial famulus Wagner with high living, sexual indulgence, long theological and philosophical discussions, and visions of the spirit world. This rouses remorse, and Faust seeks consolation in mathematics, afterward visiting hell and the stars, making wide travels, playing magic pranks, sharing in student revelry, conjuring the Grecian Helen from the nether world, living with her as concubine, and begetting a soothsaying child, called Justus Faust. When the 24 years are over, the devil carries away Faust, who ruefully points the moral of his folly. In the Faust legend one sees the Protestant theology of the Reformation expressing its views of the intellectual freedom of the Renaissance.

This tale was rendered into metrical English in 1587 and was turned into German rhymes in 1588. In 1599 the tale appeared with an elaborate commentary by G. R. Widman (consult Scheible's *Kloster*, vol. ii, pp. 273 ff., Stuttgart,

1845-49), furnishing apparently the main source of subsequent versions. In 1589 a French version appeared by Victor Palma Cayet. The German version was done into English prose, and of this there was a revision in 1592, with a Dutch version of the same year, in which the death of Faust is dated Oct. 23-24, 1538. Soon after the story first reached England its central thought was seized on by Marlowe in his powerful drama *The Tragedy of Dr. Faustus*, written as it seems in 1589, though not entered at Stationers' Hall till 1601. Marlowe follows the legend closely.

An interesting parallel between Faust and Luther has been drawn by Scherer.

Faust brings to the University of Wittenberg "a foolish and arrogant mind," seeking to explore nature beyond scholarly tradition and so led to classical culture and to the devil. The Luther of history and the Faust of the legend both lectured on ancient culture. Faust yields to it and Helena. Luther marries after the Christian ordinance. Luther clings to his Bible. Faust would explore behind and beyond it. Luther fights with the devil; in the legend, Faust compacts with him. Both visit Rome. Luther is roused to revolt, Faust is amused and cynical.

It was the melodramatic and spectacular elements in his drama, however, that made it hold the stage, and after Marlowe's death (1593) these were still further accentuated, so that when English actors brought the drama back to Germany it was essentially a popular, not to say a vulgar, spectacle, in which a clown, who in Goethe's drama has become Wagner, representing the shrewd philistine common sense of the middle class, is accorded the chief part. It also appeared as a puppet play, a Punch and Judy show to amuse children; and thus it was seen by the boy Goethe, as a modification of it may yet be seen by the German children of to-day. The situation, however, made possible a dramatic treatment of the deepest problems of man's mortal existence. This was widely perceived. Lessing essayed the subject in 1759. Friedrich Müller, known as "Maler" Müller, published in 1778 two fragments of a dramatized *Fausts Leben*. Klinger, of the Storm and Stress, published (1791) a romance on *Fausts Leben, Thaten und Höllenfahrt* (trans. by Borrow, 1826). Goethe, who had begun work on the subject as early as 1773 and committed several scenes to friends in the so-called *Göckhausen-Faust* (discovered in 1887), published *Faust, ein Fragment*, in 1790, the complete first part in 1808. The second part appeared posthumously in 1832. Klingemann wrote a tragedy (1815), Lenau a tragedy (1836), Heine a ballet (1851), on *Faust*. Many others have made use of the material. Goethe's *Faust* was adapted to the English stage by W. G. Wills in 1885 and produced with much splendor and success by Sir Henry Irving. Of Goethe's *Faust* there are many English translations, of which Bayard Taylor's is the best. The most convenient *Bibliography* of the older Faust literature is K. Engel's *Zusammenstellung der Faust-Schriften* (Oldenburg, 1885). Consult introduction to Thomas's *Goethe's Faust* (2 vols., Boston, 1912).

FAUST, or **FUST**, JOHANN. See **FUST**.

FAUSTA, FLAVIA MAXIMIANA (289-327). A Roman empress, a daughter of Maximianus, a colleague in the Empire with Diocletian, and

compelled to abdicate with him. Fausta became the second wife of Constantine the Great in 307 A.D. She was ambitious and was constantly meddling in affairs of state. She had great influence with Constantine, for whose advancement she was willing to make almost any sacrifice. It is said that she reported to him a plot in which her father, Maximianus, was concerned, thereby causing Constantine to order the execution of Maximianus. She met her death by suffocation in a heated bath, at Constantine's order. This action is variously stated as being due to a discovery of her infidelity, or at anger upon finding the falsity of statements made by her which had led him to put to death Crispus, his son by a former wife. She was the mother of the subsequent emperors Constantinus II, Constantius II, and Constans. Consult *The Cambridge Medieval History*, vol. i (New York, 1911).

FAUSTIN I, fō'stān' (1785-1867). An emperor of Haiti, known before his elevation to the throne as Faustin Soulouque. He was a negro and was born in very humble circumstances at Petit Goave in Haiti. In his youth he acted as a servant and later as adjutant to General Lamarre and took part in the negro insurrection of 1803. He subsequently served under Presidents Pétion and Boyer and was raised by the latter to the rank of captain. After the year 1844, when the Haitian Republic was dissolved by the rebellion of the eastern part of the island, which established the Republic of Santo Domingo, a struggle for the supreme power ensued, in which Faustin, as Governor of Port-au-Prince and commander of the Presidential Guard, played an important part. In 1847 he was appointed President of the Republic by the Senate, which hoped to find a pliable tool in him; but he speedily began to follow his own inclinations. He was an implacable enemy of the mulattoes, and on April 16, 1848, a massacre of the mulatto population in Port-au-Prince took place at his instigation. In August, 1849, he caused himself to be proclaimed Emperor, a title which he held for about 10 years. Between 1849 and 1857 he made four attempts to conquer Santo Domingo, but failed. His reign was marked by oppression and cruelty; he plundered the country to meet the expenditures of his court, which he conducted in apish imitation of that of Napoleon III. A revolution, headed by General Geffrard, broke out in 1858, and a republic was declared. Faustin was forced to abdicate in January, 1859, but was allowed to live and sent off to Jamaica. He returned to Haiti shortly before his death, which occurred on Aug. 6, 1867.

FAUSTINA. The name of two Roman empresses, mother and daughter. The former, **ANNIA GALERIA FAUSTINA**, usually spoken of as **SENIOR**, was the wife of the Roman Emperor Antoninus Pius, and died 141 A.D. (or perhaps, 140). (See **ANTONINUS**; **FAUSTINA**, **TEMPLE OF**).—**FAUSTINA JUNIOR**, daughter of the foregoing and Antoninus Pius, was married to his successor, Marcus Aurelius Antoninus, and died at a village near Mount Taurus in 175 A.D. Both, but particularly the younger, are described by the Roman historians as notorious for the profligacy of their lives, which their exemplary husbands in vain endeavored to check. The younger Faustina was heartily beloved by Marcus Aurelius; hence some have

questioned the judgment of the historians. After their deaths institutions for the relief of poor girls were founded both by Antoninus and Marcus Aurelius in honor of them and were called "*Puella Alimentariae Faustinae*."

FAUSTMANN, foust'mán, MARTIN (1822-76). A German forester, born at Giessen and educated at the same place, studying theology first and then forestry. He invented an instrument for measuring the height of trees and made valuable studies in the problems of forest valuation—a subject which is discussed in his work, "*Berechnung des Wertes, welchen Waldboden sowie noch nicht haubare Holzbestände für die Waldwirtschaft besitzen*," published in the *Allgemeine Forst- und Jagdzeitung* (Frankfort, 1849).

FAUSTULUS. The legendary shepherd who discovered the abandoned infants Romulus and Remus and took them to his house, where they were brought up by his wife, Acca Larentia. His hut was shown on the Palatine.

FAUSTUS OF RIEZ, ré'ez'. A Semi-Pelagian of southern France, who lived during the fifth century. The place of his birth is disputed, and the precise dates of both his birth (405-410) and death (490-495) are unknown. He entered the monastery at Lerinum (Lerins), where he was afterward (about 432) made abbot. Here he was vigorous in defending the rights of the monastery against the Diocesan Bishop of Fréjus. After some 25 years of service as abbot, Faustus was made Bishop of Regium (Riez) in Provence, which office he held until his death. During about four years of this time (c.481-485) he suffered exile, probably on account of his strictly orthodox Trinitarian doctrine, which offended the (Arian) West-Gothic King, Eurich. Faustus opposed all Arianism and other Eastern heresies, e.g., Macedonianism and Nestorianism; but judged by Augustinian standards, he fell into error in his views respecting free will and divine grace. He belongs to that large class of fifth-century churchmen who are called Semi-Pelagians, though perhaps Semi-Augustinians would be a more accurate designation. (See SEMI-PELAGIANISM.) He held peculiar views regarding the soul, apparently teaching its corporeality.

Among Faustus's writings are letters, dogmatic and ethical treatises, and homilies. Two of his homilies on the Creed (wrongly attributed in the manuscripts of Eusebius of Emesa) are of special value. His interest in the ascetic life is illustrated by his six *Sermons ad Monachos*. His chief work, entitled *On the Grace of God*, exhibits the Semi-Pelagian side of his teaching. An incomplete edition of Faustus's works may be found in Migne, *Patrol. Lat.*, lvii; a better edition is that by Engelbrecht, in *Corpus Scriptorum Eccles. Lat.*, xxi (Vienna, 1891). Consult: Koch, *Der heilige Faustus* (Stuttgart, 1895); Worter, *Zur Dogmengeschichte des Semi-pelagianismus* (Münster, 1900); Harnack, *History of Dogma*, vol. v (Eng. trans., Boston, 1899).

FAUVEL, fô'vel', SULPICE ANTOINE (1813-84). A French physician. He was born and educated in Paris, and subsequently went to Turkey, where he became a member of the Sanitary Council at Constantinople (1848). Shortly after his return to Paris in 1866, he was appointed inspector general of the Sanitary Department of the French government. His works on the Oriental plague, the cholera, which he

had closely studied during his long residence in the East, and typhus were extremely valuable and had much influence on the quarantine regulations of numerous governments. His works include: *Le choléra, étiologie et prophylaxie* (1868); *Rapports sur l'organisation du service des quarantaines en Turquie* (1873); *Règlement général de police sanitaire maritime* (1876).

FAUVELET, fô'vlâ', JEAN BAPTISTE (1810-90). A French genre and still-life painter. He was born at Bordeaux and studied under Delacour, but was a follower of Meissonier. His paintings are very small, of delicate and harmonious color, and highly finished, but without being hard. Among his pictures are: "A Young Man Reading" (1845); "The Two Roses" (1847); "The Carver" (1850); "The Prodigal Son" (1869); "Ascanio" (Luxembourg Museum); "Pheasants" (Wallace collection, London); "Rigolo" (Chartres Museum).

FAVARA, fâ-vâ'rá. A city of Girgenti, Sicily, 1066 feet above sea level, 6 miles east of Girgenti and 9 miles from the Mediterranean (Map: Italy, D 6). It mines sulphur, alum, and tourmaline, quarries marble, markets fruit, and has a castle of the Chiaramonte family, who in the fourteenth century were politically important. Pop. (commune), 1901, 20,398; 1911, 21,599.

FAVARO, fâ-vâ'rô, ANTONIO (1847-). An Italian mathematician, born in Padua and educated in that city and at Turin and Zurich. In 1872 he was appointed professor of graphic statics at Padua and in 1878 opened a course on the history of mathematics at that university. In 1879 he began to devote himself more particularly to the study of Galileo and in 1887 was intrusted with the preparation of a national edition of Galileo's works. He prepared more than 200 memoirs and other writings, a large number of which are devoted to the study of Galileo. Among these are: *La statica grafica nell'insegnamento tecnico superiore* (1873); *Lezioni di statica grafica* (2d ed., 1877); *Miscellanea Galileiana inedita* (1887); *Nuovi studi Galileiani* (1891); *Trent anni di studi Galileiani* (1907); *Atti della nazione germanica artista nello Studio di Padova* (1911-12).

FAVART, fâ'vär', CHARLES SIMON (1710-92). A very prolific French dramatist and theatrical manager, at one time director of the Opéra Comique. He wrote, largely in collaboration with his wife, some 150 comedies and operettas, of which the more noted are: *La chercheuse d'esprit* (1741); *Les amours de Bastien et de Bastienne*, a parody on *Le devin du village*; and *Les trois sultanes*. His works are published in 10 vols. (Paris, 1763-72); a selection of them in 3 vols. (1813). His *Mémoires et correspondance littéraires* (Paris, 1808) is very valuable for the history of the French drama. Consult Font, *Favart, L'opéra comique, et la comédie-vaudeville aux XVIIe et XVIIIe siècles* (Paris, 1894). His wife, MARIE JUSTINE BENOÎTE DUBONCERAY (1727-72), was a most distinguished comédienne, singer, and dancer. She was the first French actress to appear in real peasant's garb, when playing a peasant character. It was her popularity and influence that made possible the successful introduction of Italian light opera in France.

• **FAVENTIA**. See FAENZA.

• **FAVERSHAM**, fâv'er-sham. A municipal

borough, market town, and seaport of Kent, England, and a member of the Cinque Port of Dover, on a navigable arm of the Swale, opposite Sheppey Island, 9 miles west-northwest of Canterbury (Map: England, G 5). Its parish church is a handsome early-English structure, with curious carvings and a fine spire. Of the Cluniac Abbey, founded by King Stephen, in which he, his wife, and son were buried, there are but slight remains. It has valuable oyster fisheries and carries on a large trade in fruit and hops. There is also a considerable industry in shipbuilding and in the making of bricks and cement. It sends much agricultural produce to London. In the vicinity are large gun cotton and powder factories. Gas and water are supplied by private companies, but the town owns its electric-lighting plant. Pop., 1901, 11,290; 1911, 10,619. Under the name of Faversfield it was a seat of the Saxon kings. Its earliest existing charter dates from the reign of Henry III. Here James II was arrested and sent back to London after his first attempt to escape to France.

FAVERSHAM, fāv'ēr-shām, WILLIAM (1868-). An American actor, born and educated in England. In 1888 he came to the United States and in 1893 joined the Empire Theatre Company, of which he became leading man in 1896, appearing in a number of successful plays. He left the Empire Company in 1901 and made his début as a star as Don César in *A Royal Rival*. In 1908 he appeared in New York under his own management in *The World and his Wife*, an adaptation of Echegaray's *El Gran Galeoto*. The following year he produced Stephen Phillips's *Herod*, appearing in the title rôle. In 1912 and 1914 he presented productions of *Julius Caesar* and *Othello*, playing in the former Anthony and in the latter Iago. Consult William Winter, *The Wallet of Time* (2 vols., New York, 1913).

FAVIGNANA, fāv'é-nyā'ná. The chief of the Ægadian Islands (q.v.), lying about 6 miles off the west coast of Sicily, and about 6 miles long and about 2 miles wide (Map: Italy, D 6). Area, $7\frac{1}{2}$ square miles. The chief town of the same name, situated on the north side, has a good harbor and is defended by three forts. A colony of convicts is kept at Favignana. Pop. of island, 1901, 6414; 1911, 6079; the most important industry is fishing. Many caves exist on the island, and in some of them have been found ancient weapons and utensils.

FAVONIUS, MARCUS (?90-42 B.C.). A Roman politician, nicknamed "Cato's Ape," on account of his servile imitation of the latter's character and conduct. He was a partisan of the Optimates, and opposed all the measures of the first triumvirate. Notwithstanding his personal aversion to Pompey, he fought with him during the Civil War, but upon Pompey's death was pardoned by Cæsar. He took no part in the conspiracy against Cæsar, but after his murder espoused the cause of Brutus and Cassius. He was put to death by Octavius after the battle of Philippi.

FAVORINUS. A sophist and skeptical philosopher of the time of Hadrian. He was a native of Arelate (Arles) in Gaul, but for many years was a traveler in Greece and in the East. He was on intimate terms with Plutarch, Herodes Atticus, Demetrius of Alexandria, Cornelius Fronto, Aulus Gellius, and with the Emperor

Hadrian himself. He wrote: *Pantodape Historia* (Miscellaneous History), in 24 books, which dealt, at least in part, with the history of philosophy (used by Diogenes Laertius and Stephanus of Byzantium); *Apomnemonemata* (Memoirs); a work on the rearing of children, *Peri Paidon Tropes*; *Pyrroneioi Tropoi* (Pyrrhonian Tropes), in 10 books, an attempted application of the methods of Pyrrho (q.v.) to practice in the law courts. Only a few fragments of his works have been preserved. His conversations are described at some length by his devoted admirer, Gellius, in the *Noctes Atticæ*. Consult: Goedeckemeyer, *Die Geschichte der griechischen Skeptizismus* (Leipzig, 1905); Gabrielsson, *Ueber Favorinus und seine Παιροδανή 'Ιστορία* (Leipzig, 1906); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii (5th ed., Munich, 1913); Schick, *Favorin Ipsi Παίδων Τροπῆς und die antike Erziehungslehre* (Leipzig, 1912).

FAVORITA (fāv'vô-rē'tá), LA (It., the favorite). An opera by Donizetti (q.v.), first produced in Paris, Dec. 2, 1840; in the United States in 1848.

FAVOSITES, fāv'vô-sī'tēz. The most important genus of fossil tabulate corals, characterized by the vertical rows of round pores that perforate the walls of the individual polygonal cells. The animals of this coral formed colonies of rounded or branching form, and in the Silurian and Devonian periods they were important coral-reef builders. Silicified specimens of *Favosites* and its near ally, *Michelinia*, are often found lying loose in the residual soils of Silurian and Devonian regions and are then known to the farmers of the vicinity as "fossil bees' nests." The best-known species are *Favosites niagarensis* and *Favosites gothlandicus*, of the Silurian, and *Favosites polymorpha*, of the Devonian. See Plate of CORALS.

FAVRAS, fāv'vrá', THOMAS DE MAHY, MARQUIS DE (1744-90). A French general, born at Blois. He entered the French army, and in 1772 became first lieutenant in the Swiss Bodyguards of the Count of Provence (afterward Louis XVIII). In 1787 he organized and commanded a legion of émigrés in Holland. Two years later he was accused of conspiracy with the Comte de la Châtre to secure the escape from Paris of the King and was condemned to death and executed. Consult the memoir (Vienna, 1881) by Freiherr von Stillfried Ratenic, a descendant of Favras's daughter, and the elaborate article by Monin in *La grande encyclopédie*.

FAVRE, fāv'vr', ALPHONSE (1815-90). A Swiss geologist. He was born at Geneva, studied at the academy there, and was appointed professor of geology in the academy. He was a correspondent of the French Institute. His researches regarding the geology of the Alpine regions gained for him a prominent place in the list of scientists who have devoted themselves to the investigations of mountain structure. His experimental work on the folding of rocks also commanded wide attention. His more important works include: *Sur la structure en éventail du Mont Blanc* (1865) and *Recherches géologiques dans les parties de la Savoie, du Piémont et de la Suisse voisines du Mont Blanc* (3 vols., 1867).

FAVRE, JULES CLAUDE GABRIEL (1809-80). A French advocate, author, and politician. He was born at Lyons, March 21, 1809, and studied for the bar at Paris, where he took an active

part in the July revolution of 1830. On returning to Lyons, the same year, he became noted for his ardent republicanism. In 1834 he defended the cause of workmen accused of illegal association and identified himself with radical causes. He developed a wonderful oratorical style and became a prominent lawyer in Paris after 1835, but still found time for literary work. After the February revolution of 1848 he was Secretary in the Ministry of the Interior, in which capacity he inspired a circular demanding that the commissioners of the Republic be invested with dictatorial authority in the provinces. He was also active as a member of the Committee of Foreign Affairs. After the election of December 10 Favre showed himself a persistent antagonist of Louis Napoleon and after the flight of Ledru-Rollin became the orator of the radical Republicans. He was an ardent Republican but a Liberal of the older type with a leaning to the Right and no sympathy with Socialism. In questions of taxation, freedom of the press, and the death penalty he voted with the Left. The coup d'état of Dec. 2, 1851, closed his political career for the time. In 1858 he defended Orsini, who had attempted to murder Napoleon III. In the same year he became a member of the Corps Législatif, and a leader of the small group whose persevering opposition to the Empire promoted the revival of Republican opinion that finally submerged it. He gradually gave place in popularity to younger Republican leaders like Rochefort and Gambetta. In his discourse on entering the French Academy in 1868, he appeared as a spiritualist and an antiradical. In 1868 he founded the Republican journal *L'Electeur*, and he opposed with all his power the policy which led to the breach with Prussia. After Sedan, Favre called for the deposition of the Emperor and the formation of a Government of National Defense. He was chosen Vice President and became Minister of Foreign Affairs and carried on negotiations with Count Bismarck, but was less successful as a practical administrator than he had been as a polemist and orator. When Thiers became Chief of the Executive, he appointed Favre Minister of Foreign Affairs, and as such he signed the definitive Treaty of Paris at Frankfurt, May 10, 1871. He resigned office in July, 1871, and resumed his law practice. Favre was a voluminous writer on social and political subjects. He died at Versailles, Jan. 19, 1880. Among his works may be mentioned: *Rome et la république française* (1871); *Le gouvernement du 4 Septembre* (1871-72); *Conférences et mélanges* (1880-82). Consult: Maritain, *Jules Favre, mélanges politiques* (Paris, 1882); King, *French Political Leaders* (New York, 1882); Benoit-Lévy, *Jules Favre* (Paris, 1884); G. Hanotaux, *Histoire de la France contemporaine* (ib., 1903).

FAVRE, LOUIS (1826-79). A French engineer and contractor. He was born at Chêne-Bourg, near Geneva, and studied railroad engineering in France. He displayed great engineering skill at Lyons and elsewhere, and in 1872 was awarded the contract for the construction of the St. Gotthard Tunnel within the space of eight years.

The severe competition for the contract appears to have caused bad feeling against Favre, who subsequently encountered not only unexpected difficulties in construction, but also, it is said, the opposition of the chief engineer

of the tunnel. Favre conducted the work with ability up to the time of his death, and it was completed not long after the expiration of the contract period. Contentions over the responsibilities for this delay and other financial claims on both sides resulted in litigation which extended until 1885. The executors appear to have got the best of the litigation, although, according to the *London Contract Journal* (article reprinted, *Engineering News*, July 11, 1885), Favre lost his fortune before his death, and the sum recovered by his executors was not adequate compensation for the work done.

FAVUS (Lat., honeycomb, *Tinea favosa*, crusted ringworm). A disease of the skin, chiefly of the scalp, characterized by yellowish, dry incrustations of more or less roundish form, and often cup-shaped, composed of the sporules and mycelia (q.v.) of a vegetable growth, the *Achorion schönleini*. The disks of favus are produced with great rapidity and spread rapidly, if not attended to at the first, over the whole scalp, destroying the bulbs of the hair, which becomes very short and thin and then falls out altogether. Favus spreads only where cleanliness is greatly neglected and is therefore almost unknown among the better classes. It is very rare in the United States and in England; common in Hungary, Russia, Italy, France, and Scotland. It is far more common among children than among adults. It may occur on the nonhair parts of the body and also on the nails. In treating favus the fungus must be removed with the point of a knife from the free surface of the skin or the nails, and mercurial ointment should be rubbed in. If on the scalp, the cure is attempted by a variety of ointments and lotions, principally consisting of sulphur or mercury, and by pulling out the hair by the roots, or "epilation." In inveterate cases long persistence in habits of the most scrupulous cleanliness is essential, and therefore the cure is seldom permanent, though easily attained for the time. X-ray treatment has been successful in many cases. Favus is almost always followed by permanent baldness of the part affected, unlike ringworm (q.v.), which disease it somewhat resembles.

FAWCETT, EDGAR (1847-1904). An American poet and novelist, born in New York, May 26, 1847. He was graduated at Columbia University in 1867. From an early age he was a voluminous contributor to journals and a popular writer of poetry, drama, and fiction. Among his very numerous volumes are: *Short Poems for Short People* (1871); *Purple and Fine Linen*, a novel (1873); *Poems of Phantasy and Passion* (1878); *A Hopeless Case* (1880); *The False Friend*, a successful play (1880); *The New King Arthur: a Dramatic Poem* (1884); *Song and Story* (1884), poems; *Romance and Reverie: Poems* (1886); *Songs of Doubt and Dream*, collections of verse; and the novels *Fair Fame* (1894), *Outrageous Fortune* (1894), and *The Ghost of Guy Thyrie* (1897). He also published *Agnosticism and Other Essays* (1889).

FAWCETT, HENRY (1833-84). An English economist, born at Salisbury. He was educated at Trinity Hall, Cambridge, of which he was a scholar; graduated with high mathematical honors in 1856, and was elected a fellow in the same year. Mr. Fawcett was totally deprived of his sight in 1858 by an accident when shooting. Having written and published *A Manual*

of *Political Economy* (1863), the *Economic Position of the British Laborer* (1865), and having been an extensive contributor of articles on economic and political science to various magazines and reviews, he was elected, in 1863, professor of political economy in the University of Cambridge. He unsuccessfully contested for a parliamentary seat, on Liberal principles, Southwark, in 1857; the borough of Cambridge in 1862; and Brighton in February, 1864; but he was returned for the last-named constituency in 1865 and was reelected in 1868. He was unseated at Brighton at the general election of February, 1874, and was elected for Hackney in April of the same year. In 1880 he became Postmaster-General and conducted the affairs of his office with great zeal and energy. He published, besides his manual, *Pauperism: Its Causes and Remedies* (1871); *Speeches on Some Current Political Questions* (1873); *Free Trade and Protection* (1878); etc. In his economic writings Professor Fawcett was an uncompromising advocate of free trade and the individualistic economic doctrines with which that policy is associated; in politics he was a Liberal. Consult Leslie Stephen, *Life of Henry Fawcett* (5th ed., London, 1886).

FAWCETT, MILLICENT GARRETT (1847-). An English writer, born at Aldeburgh, Suffolk. In 1867 she married Prof. Henry Fawcett, the political economist, and soon afterward she began to take an interest in the woman's suffrage movement, becoming eventually president of the National Union of Women's Suffrage Societies. St. Andrew's University conferred upon her the degree of LL.D. She published among other books: *Political Economy for Beginners* (1870); *Essays and Lectures*, with her husband (1872); *Tales in Political Economy* (1875); *Janet Doncaster*, a novel (1875); *a Life of Her Majesty, Queen Victoria* (1895); *Five Famous French Women* (1906); *Women's Suffrage* (1912).

FAWKES, faks, Gux, or Guido (1570-1606). An English conspirator. The son of Edward Fawkes, a Protestant ecclesiastical proctor and notary, he was born in York. Under a stepfather's influence he became a Roman Catholic, and, after coming into possession and disposing of his father's property, he enlisted as a soldier of fortune in the Spanish army, serving in Flanders. He returned to England on the accession of James I (James VI of Scotland) and became associated with Catesby and other conspirators, who hoped to restore Roman Catholicism by blowing up the King, his Ministers, Lords, and Commons, at the assembling of the Houses of Parliament on Nov. 5, 1605. Fawkes was chosen to be the chief agent in the deed, and when he was arrested all arrangements had been made for applying the fuse to the train leading to barrels of gunpowder which had been stored in a cellar of the Houses of Parliament. Though he at first refused to divulge the names of his companions, he finally succumbed to torture and confessed. He and six of his accomplices were brought to trial before a special commission Jan. 27, 1606; and, four days later, he and three accomplices were hanged and quartered. Parliament set apart November 5 forever as a day of thanksgiving. The commemoration of the event, although fast dying out, still prevails, especially in cathedral towns, where grotesque effigies called "Guy Fawkes," or "Guys," with high cap and lantern, after

being carried in procession through the streets by fantastically garbed and masked attendants, are committed to the flames of huge bonfires. (See GUNPOWDER PLOT.) Consult: *A True and Perfect Relation* (London, 1606), reprinted, with new materials, as *The Gunpowder Treason* (ib., 1679); Howell, *State Trials* (34 vols., ib., 1809-28); Winwood, *Memorials* (3 vols., ib., 1725); *The Fawks of York in the Sixteenth Century* (ib., 1850); Gardiner, *What the Gunpowder Plot Was* (ib., 1897); id., *History of England* (ib., 1893-95); and Hazlitt's articles justifying Fawkes, in the November *Examiner* (ib., 1821).

FAWNIA, fǎ'ni-a. The lady love of Dorastus, in Robert Greene's *Pandosto* (or *Dorastus and Fawnia*). The character suggested the Perdita of Shakespeare's *Winter's Tale*.

FAX/WAX, or PAX/WAX. The ligament sustaining the weight of the head. See **LIGAMENT**.

FÁY, fi, ANDRÁS (1786-1864). An Hungarian author, born at Kohány, County of Zemplén. He studied philosophy and law at the Protestant College of Sárospatak, was called to the bar, and for a time held an official position at Budapest. Ill health, however, soon led him to resign, and he henceforth devoted his life to literary pursuits and to the cause of national progress. After two volumes of poems appeared a collection of fables, *Mesék* (1820), which first brought him into prominence. Some of his fables have been translated into English by E. D. Butler (*Hungarian Poems and Fables*, London, 1877). His other writings include a tragedy, *A két Báthory* (The Two Báthorys) (1827); several comedies, the best of which is *Régi Pénzek* (Ancient Coins); the first attempt at an Hungarian society novel, *A Békely ház* (The House of the Békelys) (1832); and a humorous novel, *Jávor orvos és Bakator Ambrus szolgája* (Doctor Jávor and his Servant Ambrose Bakator) (1855). In 1835 he was elected to the Hungarian Diet. Fáy was a constant contributor to literary and scientific periodicals upon important social questions and contributed largely to the accomplishment of many important reforms, such as the establishment of a national theatre at Budapest and the introduction of life insurance and of savings banks into Hungary. Since his death the Budapest savings banks have established a fund in his memory, the income of which is awarded each year to the most notable literary production of the year, exclusive of belles-lettres. Fáy's collected works are contained in 8 vols. (Budapest, 1843-44); his novels in a more recent edition (3 vols., ib., 1883). For his biography, consult Badics (Budapest, 1890) and Erdélyi (ib., 1890).

FAY, fá, CHARLES ALEXANDRE (1827-). A French general and military writer. He was born at Saint-Jean-Pied-de-Port and was educated at Saint-Cyr and at the school for the general staff. He was engaged in the topographical work in the Pyrenees, served in Africa, and had his horse shot under him at the battle of Laghouat (1852). During the Crimean War he was aid-de-camp to General Bosquet and fought brilliantly at the Alma and Inkerman. Upon the outbreak of the Franco-German War, in 1870, he was appointed lieutenant colonel on the staff of Marshal Bazaine and was taken prisoner at the capitulation of Metz. In 1874 he was charged with the organization of the

bureau of the general staff and appointed brigadier general. On Feb. 1, 1890, he was appointed commander of the Eleventh Army Corps and was retired in 1892. He wrote: *Souvenirs de la guerre de Crimée* (1867); *Etude sur la guerre d'Allemagne en 1866* (1867); *De la loi militaire* (1870); *Journal d'un officier de l'armée du Rhin* (1871; 5th ed., 1890); *Etude de marches: Jéna, Sedan* (1899).

FAY, CHARLES ERNEST (1846-). An American linguist and Alpinist, born at Roxbury, Mass. He graduated in 1868 at Tufts College and became instructor in mathematics there in 1868, in modern languages in 1869, and professor of modern languages in 1871. In 1883 he assisted in founding the Modern Language Association, of whose pedagogical section he was president in 1890, and he was president of the New England Association of Colleges and Preparatory Schools in 1888-89 and of the New England Modern Language Association in 1905. He is author of various monographs and articles on modern-language subjects. A pioneer in the development of mountaineering in the Canadian Rockies and the Selkirk, he served as president of the Appalachian Mountain Club in 1878, 1881, 1893, and 1905, and as first president of the American Alpine Club (1902-08); has been elected honorary member of several foreign Alpine clubs; since 1879 has edited *Appalachia*, and since 1907 *Alpina Americana*, the second number of which is his monograph on "the Rocky Mountains of Canada." A contributor to the *NEW INTERNATIONAL ENCYCLOPEDIA*.

FAY, EDWIN WHITEFIELD (1865-1920). An American classical scholar and educator. He was born at Minden, La., and was educated at the Southwestern Presbyterian University (A.M., 1883) and at Johns Hopkins University (Ph.D., 1890). He also studied at Leipzig. In 1890-91 he was instructor in Sanskrit at the University of Michigan and in 1893-99 held the professorship of Latin at Washington and Lee University. At the University of Texas he was acting associate professor in 1892-93 and after 1899 professor of Latin. Besides essays on Sanskrit and contributions on philology, he published: *The History of Education in Louisiana* (1898); *The Mostellaria of Plautus* (1902); *Culture in Education* (1912).

FAY, THEODORE SEDGWICK (1807-98). An American poet, essayist, and story-writer, born in New York City. He studied law, but never practiced, and in 1828 became associate editor of the New York *Mirror*, for which he wrote during extended travels in Europe. He was Secretary of the American Legation in Berlin (1837-53), then Minister Resident in Bern, Switzerland (1853-61), and lived for some years in Berlin. Among his books are: *Dreams and Reveries of a Quiet Man* (1832); *Norman Leslie*, a tale, long popular, of New York, afterward dramatized (1835); *Sydney Clifton* (1839); *Countess Ida* (1840); *Hoboken*, a romance (1843); and *Robert Rueful* (1844). To poetry he contributed *Ulric, or the Voices* (1851); to theology, *Views of Christianity* (1856); to history, *Suitzerland* (1860) and *History of the Three Germanys* (1889); to education, *Great Outlines of Geography* (1887) and *First Steps in Geography* (1873).

FAYAL, fi-ál' (Portug., place planted with beech trees; so called on account of some trees mistaken for beeches by the early European colonists of the island). One of the Azores (q.v.).

VOL. VIII.—27

in lat. 38° 25' N., and long. 28° 35' W., situated a little to the west of the island of Pico (Map: Portugal, A 4). It is about 10 miles long; area, 64 square miles. It has a mountainous surface, rising to an altitude of over 3300 feet. Its soil is fertile, producing grain, oranges, potatoes, and onions. There is a scarcity of water and wood. The salubrious climate attracts many visitors. The island has in former times suffered from volcanic outbreaks. Fayal has a population of 22,385. Its chief port is Horta (pop., 6734), where the German submarine cable from Borkum to New York has a station.

FAYE, fâ, HERVÉ AUGUSTE ETIENNE ALBANS (1814-1902). A French astronomer. He was born at Saint-Benoît-du-Sault (Indre) and was educated at the Ecole Polytechnique, which he left in 1834, before completing his course, to accept a position in the observatory at Paris to which he had been appointed on the recommendation of M. Arago. He made rapid progress in his astronomical studies and investigations, and on Nov. 22, 1843, attracted world-wide attention by the discovery of the periodical comet which bears his name. This discovery won him the Lalande prize and a membership in the Academy of Sciences. In 1848 he became an instructor in geodesy at the Polytechnique, and in 1854 rector of the academy at Nancy and professor of astronomy in the faculty of science there. He was inspector general of secondary education from 1857 to 1862 and was appointed professor of astronomy and geodesy at the Ecole Polytechnique in 1873. He served as president of the Bureau of Longitudes in 1876 and chief inspector of higher education in 1877, and in the latter year for a short time was Minister of Public Instruction in the Rochebouet cabinet. His work covers the entire field of astronomical investigation. It comprises the determination of comet periods, the measurement of parallaxes, and the study of stellar and planetary movements. He advanced several original theories on the nature and form of comets, meteors, the aurora borealis, and the physical constitution of the sun. In collaboration with Charles Galusky he translated Humboldt's *Cosmos* (4 vols., 1846-59), and, in addition to numerous contributions to scientific periodicals, published the following important works: *Sur les déclinaisons absolues* (1850); *Leçons de cosmographie* (1852; 2d ed., 1854); *Sur les cyclones solaires* (1873); *Cours d'astronomie de l'Ecole Polytechnique* (2 vols., 1881-83); *Sur l'origine du monde* (1884; 3d ed., enlarged, 1895); *Nouvelle étude sur les tempêtes, cyclones, trombes, ou tornados* (1897). See **FAYE'S COMET**.

FAYERWEATHER, fâr'wêth-ër, DANIEL B. (1821-90). An American merchant and philanthropist, born at Stepney, Conn. He accumulated a fortune as a leather dealer in New York City. He made special bequests to charitable and educational institutions, aggregating more than \$2,000,000, and directed that about \$3,000,000 more should be placed with three executors for similar distribution. His will was subjected to a remarkable and prolonged contest, which resulted in a complete victory for the beneficiaries.

FAYE'S COMET. A comet discovered at Paris by Faye, Nov. 22, 1843. It is one of the periodic comets, whose return has been observed several times; viz., in the years 1851, 1858, 1865, 1873, 1880, 1888, 1895, and 1910. See **COMETS**.

FAYETTE, fā-ét'. A town in Fayette Co., Iowa, 128 miles northwest of Davenport, on the Chicago, Milwaukee, and St. Paul Railroad (Map: Iowa, F 2). Upper Iowa University (Methodist Episcopal), founded in 1857, is situated here, and the town contains a Carnegie library. Fayette has a creamery and agricultural interests. Settled in 1856, it was incorporated as a town in 1874 under a general State law. The water works and electric-light plant are municipally owned. Pop., 1900, 1315; 1910, 1112.

FAYETTE. A city and the county seat of Howard Co., Mo., 135 miles (direct) west by north of St. Louis, on the Missouri, Kansas, and Texas Railroad (Map: Missouri, D 2). The Howard Payne College for Women (Methodist Episcopal, South), opened in 1844, and the Central College (Methodist Episcopal, South), opened in 1857, are situated here, and the city contains a Carnegie library. Fayette has flouring mills and agricultural interests. It owns its water works and lighting plant. Pop., 1900, 2717; 1910, 2586.

FAYETTEVILLE, fā-ét-vil. A city and the county seat of Washington Co., Ark., 63 miles north by east of Fort Smith, on the St. Louis and San Francisco and the Kansas City and Memphis railroads (Map: Arkansas, A 1). It is a popular summer resort, noted for its picturesque situation and mineral wells, and is the seat of the University of Arkansas. A national cemetery, containing 1236 graves, 782 of unknown dead, and a Confederate cemetery, in the centre of which stands a handsome monument, are situated here. The city contains also a hospital, county jail, and a courthouse. Fayetteville has manufactures of lumber, flour, wagons, foundry products, etc., and a trade in live stock, grain, fruit, and agricultural produce. The water works are owned by the municipality. Pop., 1900, 4061; 1910, 4471. 7394

FAYETTEVILLE. A city and the county seat of Cumberland Co., N. C., 60 miles south by west of Raleigh, on the Cape Fear River, at the head of navigation, and on the Aberdeen and Rockfish, the Norfolk Southern, and the Atlantic Coast Line systems (Map: North Carolina, D 2). The State Colored Normal School and the Donaldson-Davidson Academy are situated here, and there are hospitals, a military school, and an Elks Home. The city is in a fertile agricultural region, carries on a trade in cotton and naval stores, and has extensive manufactures of cotton, silk, cottonseed oil, lumber, furniture, flour, woodenware, tools, etc. There is also a large vineyard. Manufacturing has been greatly enhanced by the development of electrical power from the Buckhorn Rapids above the city, and the canalization of the Cape Fear River from Fayetteville to Wilmington, insuring a depth of 8 feet. The city government, under a charter of 1893, is vested in a mayor, chosen annually, and a municipal council, elected on a general ticket. It owns the water works and electric-light plant. Pop., 1900, 4670; 1910, 7045.

Settled by the Scotch in 1736 and laid out as Campbellton in 1762, Fayetteville received its present name during a visit of Lafayette in 1784 and was incorporated as a city in 1893. In 1831 it was almost completely destroyed by fire. On April 22, 1861, Governor Ellis of North Carolina seized the United States arsenal here, containing a number of cannon, a large quantity of ammunition, and 35,000 small arms. In 1865

General Sherman's forces occupied the village, destroying the arsenal and considerable property.

FAYETTEVILLE. A town and the county seat of Lincoln Co., Tenn., 75 miles south of Nashville, on the Elk River, and on the Nashville, Chattanooga, and St. Louis Railroad (Map: Tennessee, D 4). It contains the Morgan Training School, high schools, and a public library. It is the centre of a fertile agricultural district, producing corn, cotton, wheat, tobacco, fruits, and live stock. There are lumber, cotton, and flour mills and an ice factory. The water works are owned by the municipality. Pop., 1900, 2708; 1910, 3439. Andrew Jackson encamped here on Oct. 7, 1813, when he was campaigning against the Creek Indians.

FAYOLLE, GENERAL (French commander). For his biography see VOLUME XXIV.

FAYRER, SIR JOSEPH (1824-1907). An English physician. He was born at Plymouth and was educated at London, Edinburgh, and on the Continent. Entering the medical service of the navy, he served on H. M. S. *Victory* and later in the military hospital at Palermo during the siege of 1849. He acted as assistant surgeon in the Bengal Medical Service from 1850 to 1874, served in the Burmese War of 1852 and in the Indian Mutiny of 1857, and was residency surgeon during the siege of Lucknow. From 1859 to 1874 he was professor of surgery at the Medical College of Bengal and was successively president and vice president of the Bengal Asiatic Society. He was appointed surgeon-general and president of the India Office in December, 1874, and in 1901 became physician extraordinary to King Edward VII. His principal works are the following: *Clinical Surgery in India* (1866); *The Thanatophidia of India* (1872), a work on the poisonous snakes; *Lettsomian Lectures on Fever and Dysentery in India* (1881); *On the Preservation of Health in India* (1898); *Recollections of my Life* (1900).

FAYUM, fā'yūm', THE (Coptic *phiom*, sea, lake). An Egyptian province west of the Nile, in the Libyan Desert. It contains 670 square miles, had a population (1907) of 441,583, and is as celebrated for its fertility and productiveness to-day as it was in antiquity. Fruits of all kinds grow in abundance, and it is the only part of Egypt where the olive attains perfection. Its chief products are cotton and cereals. The greater part of the district originally formed the bed of Lake Mœris (q.v.), but great embankments constructed by the kings of the twelfth dynasty, especially by Amenemhat III (q.v.), reclaimed a large amount of land, and a considerable area was also diked off under the second Ptolemy. The modern representative of Lake Mœris is the Birket el-Kerun, or 'Lake of Horns' (so called from its shape), some 34 miles long by 4½ miles wide, which extends along the western and northern sides of the province. The Fayum is watered by the Bahr Yusuf (Joseph's Canal), a channel which diverges from the Nile to the north of Siut, enters the Fayum through a narrow opening in the Libyan chain, and then divides into numerous ramifications. From very ancient times the district was the seat of worship of the crocodile-headed god Sobk (q.v.), and its chief town was called by the Greeks Crocodilopolis. Ptolemy II Philadelphus established a colony of veterans in the district which he renamed the Arsinoite nome, and its capital, the old Crocodilopolis, was later called Arsinoë. It is now called Medinet el-

Fayum; pop., 1897, 31,262. Consult: Petrie, *Hawara, Biahmu, and Arsinoë* (London, 1889); R. H. Brown, *The Fayum and Lake Mæris* (ib., 1892); Sir William Willcocks, *The Assuën Reservoir and Lake Mæris* (ib., 1904); Bradwell, *The Topography and Geology of the Fayum Provinces of Egypt* (Cairo, 1905).

FAZIO, fà'tsé-ò. A tragedy by Dean Milman, published in London, 1815. The rôle of Bianca was a favorite with Fanny Kemble and Madame Ristori.

FAZY, fà'zé' (JEAN) JAMES (1794-1878). A Swiss statesman and author, born in Geneva and educated in Paris, where he began the study of political economy. When the Carbonari (q.v.) spread to France in 1820, he became affiliated with them and actively opposed the government of the Restoration. In 1826 he returned to Geneva, where he began the publication of *Le Journal de Genève*. Returning again to Paris some time before the end of the reign of Charles X, he entered journalism. In July, 1830, Fazy was one of the first to sign the protest of the journalists against the ordinance restricting the freedom of the press. He participated in the July revolution, favored the establishment of a republic, opposed the candidature of the Duke of Orléans, and became a member of the Radical opposition. He published the *Revue Républicaine*, and his advocacy of radical republican principles resulted in his being fined and imprisoned. In 1833 Fazy returned to Geneva. His attacks on the Swiss government in the *Revue de Genève*, which he established, resulted in the overturning of the Conservative party in October, 1846, and the establishment of the Liberal régime. Until the fall of the Liberal party from power in 1864, the history of Fazy was that of the canton, in which, from 1847 to 1853 and again from 1855 to 1861, he held the highest office. He occupied a prominent place in the Swiss Federation, and was one of the authors of the constitution of 1848. In his later years he lived quietly as professor of international law at the University of Geneva. Among his published works are, besides novels and dramas, *L'homme aux portions: Conversations politiques et philosophiques* (1821); *Principes d'organisation industrielle* (1830); *Histoire de Genève* (1838-40); *De l'intelligence collective des sociétés* (1874). Consult Henry Fazy (a cousin), *James Fazy, sa vie et son œuvre* (Geneva, 1887).

FEA, fà'a, CARLO (1753-1836). An Italian archaeologist, born at Pigna. He studied law and received the degree of LL.D. from the University of La Sapienza, but later, in 1798, took holy orders that he might have better opportunities to prosecute his study of archaeology. He was for years director of excavations in Rome. His valuable works on archaeology consist of the following: a translation, with notes (1783-84), of Winckelmann's *Geschichte der Kunst*; *Miscellanea filologico-critica ed antiquaria* (1790-1837); *L'integrità del Panteone rivendicata a M. Agrippa* (1807-20); *Relazione d'un viaggio ad Ostia ed alla villa di Plinio* (1802); an edition of the works of Horace (Rome, 1811); *Della statua di Pompeo Magno del palazzo Spada* (1812); *Iscrizioni di monumenti pubblici* (1813); *Descrizione di Roma* (1822). In 1820 he published new fragments of the *Fasti* (q.v.) *Consulares*, in his *Frammenti di Fasti Consolari*. He is the principal founder of the modern study of Roman topography.

FEAL AND DIVOT (Scotch *feal*, sod, probably from Swed. *vall*, sward, pasture, and *divot*, turf). A prædial servitude, peculiar to the law of Scotland, in virtue of which the proprietor of the dominant tenement possesses the right of turning up and carrying off turf from the servient tenement for the purpose of building fences, roofing houses, and the like. This, as well as the servitude of fuel, implies the right of using the nearest grounds of the servient tenement on which to lay and dry the turf peats or feal. These servitudes do not extend beyond the ordinary uses of the actual occupants of the dominant tenements. They are strictly analogous to the commons, especially the common of turbarry, of the English common law. See COMMON; PROFIT À PRENDRE.

FEALTY (OF. *fealte*, *feaute*, *feelteit*, from Lat. *fidelitas*, faithfulness, from *fidelis*, faithful, from *fides*, faith, from *fidere*, to believe). The obligation which binds the vassal or tenant to his feudal lord; "the very essence and foundation of the feudal association," in the words of Chancellor Kent. The oath of fealty, which was inseparable from almost every feudal tenure of land, took the following form: "Know ye this, my lord, that I shall be faithful and true unto you, and faith to you shall bear, for the lands which I claim to hold of you, and that I shall lawfully do to you the customs and services which I ought to do at the terms assigned, so keep me God and His saints." The right of the landlord to fealty is still an incident of tenure in England, although it is not exacted, except from copyholders. It is obsolete in this country. It was retained by statute in some of our States, for a time after their separation from England, but it was not enforced, and the oath of fealty has resolved itself here, as it has in England, into the oath of allegiance (q.v.). Consult Kent, *Commentaries on American Law* (14th ed., 4 vols., Boston, 1896).

FEAR (AS. *far*, Ger. *Gefahr*, danger; connected with Gk. *peira*, *peira*, trial, attack, *repân*, *peran*, to cross, Skt. *par*, to cross). A term which has been used in two senses in psychology. (1) As one of the cardinal emotions of time (see EMOTION), the opposite of hope, fear is essentially a transient experience, passing of necessity into one or other of the qualitative emotions, alarm and relief. But, since fear and alarm are both unpleasant and the passage from the one to the other is not definitely marked in consciousness, fear is also used to designate (2) the state of fear fulfilled, for which alarm is the better term. Fear proper is an unpleasant expectation (q.v.); fear fulfilled is a typical emotion of quality, with characteristic expression. Darwin seeks to explain the bodily phenomena of fear, in part, by appeal to the principles of habit, association, and inheritance. We open the eyes and raise the eyebrows, e.g., that we may see as clearly as possible all that is going on about us. In past generations fear-stricken men have taken to headlong flight or struggled violently with their enemies, and the utter prostration, pallor, sweat, and trembling of this exertion still appear when the emotion is set up, though the actual movements of escape or resistance are not made. He admits, however, that the symptoms are directly due, in part, to "disturbed or interrupted transmission of nerve force from the cerebrospinal system to various parts of the body." James seems to agree when he says that "trembling, which is

found in many excitements besides that of terror, is quite pathological." The standing on end of the hair in extreme fear Darwin regards as a relic of the bristling up of animals, whose appearance is thus made more terrible to their antagonists.

Fear is exceedingly contagious, as the records of battles and of commercial crises sufficiently show. Morbid fears play a large part in the classification of insanity (q.v.), and are also connected with certain organic and functional diseases of the heart (panphobia). Consult: Darwin, *The Expression of the Emotions* (London, 1890); James, *Principles of Psychology* (New York, 1890); Mantegazza, *La physiognomie et l'expression des sentiments* (Paris, 1885); Mosso, *Fear* (London, 1896).

FEAR, CAPE. See CAPE FEAR.

FEARN, fern, RICHARD LEE (1862-). An American newspaper correspondent. He was born at Mobile, Ala., studied at the University of the South and the University of Alabama, and graduated from Stevens Institute of Technology in 1884. He was secretary of foreign affairs for the Chicago Exposition in 1891-93. Entering journalism, he was a member of the *Brooklyn Eagle* staff in 1886-91; was Washington correspondent in 1893-97 and London correspondent in 1896 for the United Press; and after 1896 was a member of the New York *Tribune* staff and chief of its Washington bureau in 1902-09. He was president of the Gridiron Club (Washington) in 1906.

FEARNE, fern, CHARLES (1742-94). An English legal author, born in London. He was the son of Charles Fearn, well known as judge advocate of the Admiralty. The younger Fearn was educated at Westminster School and made his way to the bar through the Inner Temple. He was a man of many gifts and of more varied attainments than are often found in the masters of the legal profession, and was especially addicted to classical studies and to the making of mechanical inventions, in which he was an adept. Notwithstanding these distractions and a certain love of ease which often paralyzed his energies, his extraordinary legal talents, and especially his capacity for refined analytical reasoning, speedily made him a leader of the English bar. He was only 30 years old when he produced the remarkable *Essay on the Learning of Contingent Remainders and Executory Devises*, on which his fame mainly rests.

It was characteristic of Fearn that he should have devoted himself to the elucidation of the most technical and abstruse doctrine of the law of real property. It was as a piece of artificial mechanism, ingeniously calculated to produce certain practical results, that it attracted him, and he did nothing to furnish it with a philosophical or rational basis—perhaps an impossible task. But his analysis of the doctrine, his arrangement of its parts, and his description of its complicated operation gave it a foremost place in the artificial system of which it formed a part. The essay at once became a standard textbook of real-property lawyers, taking its place with Littleton's *Tenures*, and Coke upon Littleton, and in the decade after its publication went through several editions. It has retained its place as a legal authority and has had much learning expended upon it by subsequent editors. The best editions are those of Butler (1809-24) and J. W. Smith (1831).

Fearne's success at the bar was equally conspicuous. He was said to have been "more consulted than any man of his time," and for a time he enjoyed a great professional income. But he soon wearied of the exclusive devotion to legal pursuits which his position in the profession called for, and allowed his practice to slip away from him, and fell into straitened circumstances. He died at Chelmsford, Feb. 25, 1794, broken in mind and body, at the comparatively early age of 52. His published works include an historical sketch of land tenures in England, an "Impartial Answer" to a letter of "Junius" (published in 1770), and a volume of posthumous legal essays (1797).

FEARNLEY, fern'li, CARL FREDERIK (1818-90). A Norwegian astronomer. He was born at Frederikshald, and after studying at Christiania, was appointed Hansteen's assistant at the astronomical observatory in that city. After further studies at Bonn and Königsberg, Germany, he returned to Christiania to prosecute his investigations. In 1857 he became professor of astronomy at the university, and in 1861, upon the resignation of Hansteen, succeeded him as director of the observatory. In 1876 he was appointed chairman of the commission for the geodetic survey of Norway. In addition to numerous essays in Norwegian and German reviews, he published: *Zur Theorie der terrestrischen Refraktion* (1884); *Zonenbeobachtungen der Sterne zwischen 64° 50' und 70° 10' nördlicher Deklination* (1888); *Katalog von 3949 Sternen* (1890).

FEARNLEY, THOMAS (1802-42). A Norwegian painter, of English parentage, brother of the preceding, born at Frederikshald. He studied at Christiania, Copenhagen, and Stockholm, and from 1829 to 1830 was the pupil of Dahl at Dresden. A constant traveler, living but little in his own country, he spent some time in England, where he exhibited at the Royal Academy and British Institute (1837-38). His art has points of resemblance to that of Corot and Constable, but is more primitive. At best his landscapes are good in color and his treatment is sincere and harmonious. Among the best of them are: "Justedal Glacier" (1829); "View of Romsdalshorn"; "Grindelwald"; "View of Stockholm" (Hamburg Museum); "Gravensford," "Iabrofos Waterfall" (Christiania Gallery); "Hilly Landscape" (Weimar Museum). His clever caricatures of Turner also deserve mention.

FEAST OF FOOLS. A survival into and through the Middle Ages of the spirit of the Roman Saturnalia (q.v.). The details of its observance varied much in different places, but it was everywhere marked by the same broad, boisterous drollery. The donkey played so frequent a part in the pageantry that he often imposed his name on the celebration. (See ASS, FEAST OF THE.) In every instance there was more or less attempt at dramatic representation, the theatre being generally the chief church of the place, and the words and action of the drama being often ordered by its book of ceremonies. Several rituals of this sort are still preserved. That which was in use at Beauvais, in France, has a rubric ordering the priest when he dismisses the congregation to bray three times, and ordering the people to bray three times in answer. As the ass was led towards the altar he was greeted with a hymn of nine stanzas, of which the first runs thus:

"Orientis partibus,
Advenavit Asinus,
Pulcher et fortissimus,
Sarcinis aptissimus.
Hæ, Sire Ane, hæ!"

[From the regions of the East—
Blessings on the bonny beast!—
Came the donkey, stout and strong,
With our packs to pace along.
Bray, Sir Donkey, Bray!]

Where the ass did not come upon the stage the chief point of the farce lay in the election of a mock pope, patriarch, cardinal, archbishop, bishop, or abbot. These mimic dignitaries took such titles as Pope of Fools, Boy Bishop, Patriarch of Sots, Abbot of Unreason, and the like. On the day of their election they often took possession of the churches, and even occasionally travestied the performance of the Church's highest office. The license which finally prevailed in these mummeries at length called for the intervention of ecclesiastical authority, and the bishops and popes began to prohibit them. The Feast of Fools maintained itself in many places till the middle of the sixteenth century. At Antibes, in the south of France, it survived till the year 1644. The scene was a church, and the actors, dressing themselves in priests' robes turned inside out, read prayers from books turned upside down, through spectacles of orange peel, using coal or flour for incense, amid a babblement of confused cries and the mimic bellows of cattle and grunting of pigs. Consult Tilliot, *Mémoires pour servir à l'histoire de la fête des fous* (Lausanne, 1741), and see also BOY BISHOP; MISRULE, LORD OF.

FEAST OF WEEKS. See WEEKS, FEAST OF.

FEASTS. See FESTIVALS.

FEATHER (AS. *feþer*, Ger. *Feder*; connected with Lat. *penna*, feather, Gk. *πτερόν*, *pteron*, wing, from *πτεροβαί*, *ptesthai*, Skt. *pat*, to fly). One of the numerous complicated outgrowths from the skin forming the protective coat or plumage of birds and peculiar to this class. They exist in great variety, and serve various ends in bird economy, and are applied to diversified uses in human arts and industries.

Origin and Structure of Feathers. For the probable origin of plumage as a characteristic and essential element in the class of birds, and its influence on their evolutionary development, see BIRD. In the individual birds, as now known, the first sign of feathers appears in the embryo, about the fifth day of incubation of the egg, as slight, backward-leaning, conical pimples which arise from the mesoderm. (See EMBRYOLOGY.) Such a pim-

ple gradually sinks into the skin, forming a follicle with the papilla rising in its centre; and the walls of this follicle and surface of the papilla are formed of Malpighian cells. This central papilla forms the "feather pulp," and its upper portion becomes changed and filled with blood, forming the nutritive organ of the feather. In

STRUCTURE OF A FEATHER.

the space between the pulp and the walls of the follicle the feather is molded, by the hardening and splitting off of the three superficial layers of cells. The innermost and thinnest stratum forms a transparent sheath for the pulp, and persists ultimately as the series of thin caps observable in the stem of a feather. "The middle stratum is the thickest and becomes the feather itself, while the outermost forms a transparent and coherent cylindrical sheath, which incloses the growing feather, giving it its well-known spinelike appearance ["pin feather"], until, peeling off as scurf, it sets free the rami (vanes) of the young product." (Newton.) This is the history of the first growth, but the process is substantially the same for all feathers, which arise from the same pulps. For an account of the periodical shedding and renewal of plumage, see MOLTING. See also INTEGUMENT; SKELETON.

A complete feather consists of a shaft and a vane. The shaft is made up of the cylindrical hollow barrel, or calamus, which extends to the beginning of the vane, where it is succeeded by the opaque, pith-filled, squarish stem or rachis; in many birds the feather also bears upon the inside of its calamus an aftershaft, or hyporachis, which is a counterpart of the main feather, and occasionally, as in the emu, may equal it. The vane, or web, is the bladelike expansion along the sides of the distal part of the feather and consists of several elements: first, a row of horny lamelli, called barbs or rami, which are wedge shape in section, the thin edge being turned towards the bird's body. Their number varies: a crane's wing feather, 14 inches

PARTS OF A FEATHER.

c, calamus or "barrel," part of which has been cut away to show the series of horny "pith" cups (*p*), continued (at *p'*) through the umbiliciform pit whence arises the aftershaft (*a*); *r*, rachis; *w*, web or vane, each line here representing a "barb" or ramus; *d*, downy portion.

BARBICELS AND HAMULI.

long, has about 650 in its inner web. These barbs bear on each side similar lamelli, called barbules or radii, very minute and exceeding a

long, has about 650 in its inner web. These barbs bear on each side similar lamelli, called barbules or radii, very minute and exceeding a

million in number for such a feather as the crane's; and each one of these has its upper margin turned over like a flange, towards the rachis; furthermore, the end of each radius on that side of the ramus which looks towards the tip of the feather is split up into a fringe of hooks that reach over the radii of the next forward row and hook on to their flanges, thus connecting them all into the firm, springy, and almost air-tight fabric presented by most surface or "contour" feathers—especially a "flight feather," as a wing quill (remex) or a tail quill (rectrix). Other kinds of feathers, as the soft and fluffy underlying downs, the hairlike, degenerate floplumes, and scaly or wiry feathers, exhibit the absence of some or all of these connecting parts, or their modification.

The purpose of the feathers is mainly protection from cold and wet; they are exceedingly warm because their substance (resembling horn) is a poor conductor of heat, checking radiation, and because of the air which they contain or entangle forming a blanket of dry air about the body. To enable them the better to resist wet, most birds are provided with a store of grease in the oil gland (see BIRD), with which they often anoint the plumage. Moreover, the skin of many birds, especially aquatic species of cold climates, is covered with a thick coating of down feathers, each of which is composed of a very small soft tube lying in the skin, from the interior of which arises a minute tuft of soft filaments, without any central shaft. This downy covering secures warmth without weight, like the soft fur at the base of the hair of Arctic mammals, and is an adaptive survival of the earliest form of plumage.

The embryo within the shell, and afterward in the nest, is clothed with "nestling down," which consists of short, incomplete, nearly colorless feathers, called neossoptiles, which in some birds grow only on limited spots or, rarely, do not appear at all; and sometimes they resemble hairs or bristles more than feathers. This first coat soon disappears, being pushed off in the first molt by the growth of the real plumage, which arises from the same places and areas as did the nestling down.

Feather Tracts. Feathers do not grow uniformly over the body as might be supposed, but are arranged in definite areas, called feather tracts or pteryæ. These consist chiefly of contour feathers, but also bear many floplumes and sometimes true down. The arrangement of the pteryæ forms a special study in ornithology known as pterylography. (See BIRD; PTERYLOSIS.) Feathers grow with great rapidity, and in some birds attain a length of more than 3 feet. They are almost always renewed at least once, and in some cases partially or wholly twice, annually; hence it may readily be conceived how much vital energy must be exhibited in their development and how critical the period of molting must be. The plumage is generally changed several times before it attains the state characteristic of the adult bird; these changes may occupy a period ranging from one to five years, but some birds attain their adult plumage with the first molt. (See MOLTING.) When the sexes differ in color, as they frequently do, the young birds resemble the duller colored sex, generally the female. When the male in breeding plumage is brighter colored than the female, he usually dons a coat similar to hers after the breeding season is over.

Colors of Plumage. The colors of the feathers, to which birds owe their distinctive appearance and beauty, may be due to pigments lodged in the substance of the feather, or it may be the result of a condition of the surface which interferes with the complete deflection of light. To the latter cause is due the metallic sheen of the gorget of a hummingbird, the eyes of a peacock's tail, the "livelier iris" of the burnished dove. It is, in fact, an iridescence. Notwithstanding their extravascular nature, feathers undergo a change of color after they are completely formed, but such changes obviously cannot be due to any new deposits of pigment in the feather, for it is actually dead tissue. No subject connected with ornithology has been more earnestly discussed in the last few years than the method of color change in birds. Those who hold that birds can change color by some unexplained changes in the feathers are rapidly losing ground, however, and those who have given the subject most careful study are agreed in rejecting this theory of *aptosochromatism*, as it is called. It is well known now that most remarkable changes in color are produced merely by the wearing away or abrasion of the tips of the feathers, and this process, combined with the ordinary changes in the molt, is thought to be sufficient to account for all possible color changes.

Feathers vary in form in different parts of the body and afford important zoological characters for the distinction of species. For those of the wings and tail and their service in flying, see BIRD; FLIGHT. Consult: Coates, *Key to North American Birds* (Boston, 1903); Beebe, *The Bird* (New York, 1906); Pycraft, *A History of Birds* (London, 1910); and for fossil feathers, Shufeldt, *Journal of Geology*, vol. xxi (Chicago, 1913).

Uses of Feathers. The chief uses to which feathers are applied in the arts are three—pens, due to the peculiar elasticity of the barrels; bed feathers, due to the combined softness and elasticity of the barbs; and ornament, due to the graceful forms and delicate tints of the whole feather. The mode of preparing the barrels for pens is described under QUILL.

Bed feathers were used in England in the time of Henry VII, but it is not known how much earlier. At the present day, goose feathers are preferred, the white rather than the gray. What are called *poultry* feathers, such as those of the turkey, duck, and fowl, are less esteemed, on account of their deficient elasticity. Wild-duck feathers are soft and elastic, but contain an oil difficult to remove. The following is one among several modes of preparing feathers for beds: Clean water is saturated with quicklime; the feathers are put into a tub, and limewater is added to the depth of a few inches; the feathers are well steeped and stirred for three or four days; they are taken out, drained, washed in clean water, dried upon nets, shaken occasionally while drying, and finally beaten to expel any dust. The larger establishments, however, now prepare bed feathers by steaming, which is found to be a more profitable and efficient process. The down, which is of so light and exquisite a texture as to have become the symbol of softness, is mostly taken from the breasts of birds, and forms a warm and delicate stuffing for beds, pillows, and coverlets. The most valuable is that obtained from the eider duck, described under EIDER.

Feathers used for headdresses, or other pur-

poses of ornament, are selected according to the forms and colors which they display. The *ostrich*, a very valuable kind of feather, may be taken as an example of the way in which ornamental feathers generally are prepared by the *plumassier*. The mode of catching the bird itself is noticed under *OSTRICH*; it suffices here to state that the hunters endeavor to avoid injuring the feathers by blood or blows. When brought to market, the feathers are assorted according to quality; those from the back and above the wings are the best, the wing feathers next best, and the tail feathers least valued. The feathers of the male are rather more prized than those of the female. They are cleaned for use by repeated soakings and washings in water, sometimes with and sometimes without soap. There is also a process of bleaching by means of burning sulphur. When dried by being hung upon cords, the feathers pass into the hands of the dresser, who opens the fibres by shaking, gives pliancy to the ribs by scraping them with bits of glass, and curls the filaments by passing the edge of a blunt knife over them. If the feathers, whether of the ostrich or any other bird, remain in the natural color, little more has to be done; but if a change of tint be required, the feather is easily dyed. A process of bleaching is adopted before the dyeing, except for black.

The kinds of feathers chiefly used for ornament are those of the ostrich, adjutant, rhea or American ostrich, emu, osprey, egret, heron, bird of paradise, swan, turkey, peacock, argus pheasant, ibis, eagle, and grebe. White ostrich feathers are prepared chiefly for ladies' headdresses and black for the Highland regiments and for funeral trappings. The white and gray marabout-stork feathers, imported from Calcutta, are beautifully soft and light, and are in request for headdresses, muffs, and boas; the white kinds will sometimes sell for their weight in gold. The flossy kinds of rhea feather are used for military plumes, and the long brown wing feathers for brooms and brushes. Osprey and egret feathers are mostly used for military plumes by hussar troopers. Bird-of-paradise feathers are much sought after by Oriental princes for turban plumes. Cocks' feathers are also used for ladies' riding hats and for military plumes. See *AIGRETTE*.

Feathers in Costume. Feathers of birds have always formed a part of decorative dress of savages, and of those people removed above savagery but still of low civilization. The most showy, and perhaps the most tasteful, use of feathers was probably in those feather cloaks of which we read as a gala dress of the natives of tropical and subtropical America at the time of the Spanish Conquest. Similar decorative surfaces have been produced by many peoples of low civilization, who can procure feathers of great brilliancy and variety of color. The feathers need little preparation, and the system of mounting is the very simplest; what is wanted, then, is merely that power of arrangement of brilliant colors which is hardly ever lacking in peoples of low but established civilization. In another direction one of the most tasteful uses of feathers is that of the Zulu warriors, the men of the great military kingdom or empire constituted by Chacka in the first quarter of the nineteenth century. These soldiers, highly organized indeed for native warfare, with weapons especially adapted

to their purpose and an admirable system of military command, but defenseless as compared with Europeans armed with long-range rifles, attracted the attention of Europe by their magnificent resistance to the encroachments of the British. They wore no feathers nor other brilliant decoration except in time of actual conflict, when each warrior's head was adorned with as many and as splendid ostrich feathers as even South Africa could furnish him. Somewhat in like manner the red Indians of North America used the eagle feather, and the placing of these in one or another part of the headdress or at one or another angle showed the tribe to which the wearer belonged.

In Europe feathers have always been used for plumes in the hats or helmets of men and in the headdresses of women, although directly combined with the hairdressing (q.v.), or arranged in a hat or cap. In the sixteenth century the flap hats of men of position or of military rank were adorned with drooping plumes dyed of various colors, white being rather the exception, as is denoted by the famous white plume of Henry IV, which was white because that was the color of the house of Bourbon. The epoch from about 1830 to 1850 was distinguished for the wearing of ostrich plumes upon the head in connection with the most elegant evening dress by the ladies of France and Great Britain. At the same time the *chapeau bras*, worn sometimes by military officers and sometimes by civilian officers, was decorated with a large ostrich feather, usually at the front of the flat two-pointed hat and carried along what might be called its ridge, and secured to it at intervals to prevent its floating off at one side. The famous chapeau of Murat, Napoleon's marshal and most famous of cavalry leaders, was adorned with a standing egret (*aigrette*), on each side of which were drooping ostrich feathers. The curious and not graceful feather-like plume of certain military hats in the service of Great Britain seem to be composed of feathers much smaller and less showy than ostrich plumes, and the effect aimed at is a smooth, nearly conical mass. Cock feathers are used for the hats of the Italian Bersaglieri, the very dark-colored feathers with a curious metallic iridescence being the ones chosen. The egret is, however, more commonly worn by women, and is often set in the most elaborate and costly fashion in gold with precious stones. It is at certain epochs of fashion a headdress of special dignity. It appears that other feathers than the actual tuft of the egret heron are often used. Marabouts are used to adorn the edges of fans, their floating delicacy seeming to add to the lightness of the pretty implement itself. Swan's-down, when used to trim gowns and children's dresses, may be considered a humble imitation of the marabout.

The interest in ornithology inspired originally by the work of Audubon has led to the formation of many societies with members pledged to wage a crusade against the killing of birds for the purposes of mere adornment. In some instances the destruction has proved so wanton that the extinction of certain feathered tribes has either followed or been narrowly averted. In the United States a league has been formed looking towards the protection by national legislation of such birds as are likely to become the prey of milliners' agents. See *ORNITHOLOGICAL SOCIETIES*.

Commercial Uses. Since the introduction of the steel pen and the disappearance of the quill from correspondence, the chief commercial use of feathers other than adornment has been the stuffing of beds, cushions, and quilts. The introduction of the quill toothpick followed as a result of the abandonment of the quill for writing. M. Bardin, of Paris, raised annually two million geese for the purpose of supplying the quills for writing. The substitution of the steel pen threatened to overwhelm him in disaster and, in seeking for some other use for quills, he hit upon the toothpick.

For upholstery purposes feathers are considered valuable because of their lightness and elasticity. The best combination is that of goose and aquatic feathers. The feathers are plucked in the springtime from the living bird, as these are cleaner and more wholesome than those plucked from dead birds. The feathers of the eider duck would be the best of all, except for their property of matting. They are therefore more desirable for quilts than for mattresses. When chicken feathers are used in combination with those of swans, ducks, and geese, the feathery portion is plucked from the quill in order to insure a uniform softness. The feathers are prepared by being subjected to a powerful drying process in a heated compartment. They are then shaken thoroughly. Otherwise they would be likely to breed disease and vermin. Even carefully prepared, they are no longer regarded as the most hygienic mattresses, and the use of hair has become quite general in their stead. Germany, Russia, and France are the chief countries engaged in feather raising.

FEATHERBACK (so called from the form of the dorsal fin). One of a family (Notopteridae) of isospondylous fishes of West Africa and the Orient, which form a transition between the least specialized bony fishes and the ganoids. Outwardly they are characterized by their lozenge-like outline, the tail tapering to a point, and the caudal fin being continuous with the long anal. Both the body and head are covered with small scales, the base of the skull is double, the opercular bones are incomplete, and there is no adipose fin. Three species are known inhabiting brackish estuaries and lagoons in India and Borneo, and two species in West Africa; none exceeds 2 feet in length.

FEATHER GRASS (*Stipa*). A genus of grasses. The species, of which there are about 100, are mostly natives of warm temperate climates. All have a peculiarly graceful appearance which is due to the great length of the awns. In some of them the awn is beautifully feathered. This is the case in the well-known species, the common feather grass (*Stipa pennata*), found on dry hills in the middle and south of Europe. It is perennial, easy of cultivation, and ornamental. When gathered before the seeds are ripe, its feathery awns remain attached, so that tufts of feather grass retain their beauty throughout the winter. A variety, *Stipa pennata neo-mexicana*, is indigenous to the United States. A number of other species are native in the United States; among them are *Stipa avenaceum*, black oat grass, and *Stipa spartea*, porcupine grass. In these the awns are rigid rather than feathery. The esparto (q.v.) grass (*Stipa tenacissima*) of Spain is nearly allied to the common feather grass.

FEATHER RIVER. A river with numerous

head streams which rise in northeastern California, in the Sierra Nevada Mountains, and flow in a generally southwest direction, uniting in Butte County, a few miles northeast of Oroville (Map: California, D 3). From this point the Feather runs nearly due south, receiving Yuba River and Bear Creek on the east, and joining the Sacramento in Sutter County, about 15 miles above Sacramento. The stream is about 200 miles long, but is navigable only to Marysville, a distance of 80 miles. It flows through one of the richest gold fields in the State, and the scenery is magnificent in its upper course.

FEATHER STAR, or ANTEDON. See CRYNOIDEA.

FEATHERSTONE. A coal-mining town in the West Riding of Yorkshire, England, 2 miles west of Pontefract. It was the scene of a riot on Sept. 7, 1893, which occasioned a royal commission of inquiry owing to the killing of two miners, and the wounding of others, by the military. In 1912 the Local Government Board approved of a proposal to begin the erection of a group of workmen's dwellings. Pop., 1901, 12,100; 1911, 14,377.

FEATHERSTONHAUGH, fēth'ēr-ston-hā, GEORGE WILLIAM (1780-1866). An English author and geographer. He spent the early part of his life in travel in the western part of the United States and in the Canadian Northwest. In 1834-35 he was employed by the War Department in making geological surveys in the region now included in Wisconsin, Iowa, and Minnesota. In 1842 he was appointed a commissioner to act for the British government with Lord Ashburton in drawing up the Webster-Ashburton Treaty, and to determine the boundary between the United States and Canada under the treaty. For these services he was appointed to the consular service, serving as British Consul for the departments of Calvados and Seine, France, where he died. His numerous publications include: a translation of *The Republic of Cicero* (1828); *Geological Report of the Elevated Country between the Missouri and Red Rivers* (1834); *The Geology of Green Bay and Wisconsin* (1836); *Observations on the Ashburton Treaty* (1842); *Excursion through the Slave States* (1844); *Canoe Voyage to the Minnesota* (1847).

FEATHERWING. See PLUME MOTHS.

FEBIGER, fē'bi-gēr, JOHN CARSON (1821-98). An American naval officer, born in Pittsburgh, Pa. He entered the navy Sept. 14, 1838, and served successively on the *Macedonian*, the *Concord*, the *Chippola*, the *Potomac*, the *Dale*, the *Columbus*, and the *Germania*, and saw much hard work in South American and African waters. Commissioned a commander Aug. 11, 1862, he successively commanded the *Kanawha*, of the West Gulf blockading squadron (1862-63), which was conspicuous in the engagement in Mobile Bay, April 2, 1862; the *Osage*, *Neosho*, and *Lafayette*, of the Mississippi squadron; and the *Mattabeset* of the North Atlantic blockading squadron, which participated in the spirited engagement with the ram *Albatross* in Albemarle Sound, N. C., in May, 1864. From 1866 to 1869 he commanded the *Ashuelot*, of the Asiatic squadron. He was made a commodore in 1874, and from 1876 to 1880 was commandant of the Washington Navy Yard. On Feb. 4, 1882, he was promoted to the rank of rear admiral, and was retired in the following July.

FEBRIFUGE (from Lat. *febrifugia*, centaur, a plant supposed to cure fever, from *febris*, fever + *fugare*, to put to flight, from *fugere*, to flee). A medicine calculated to remove or cut short a fever (q.v.). The term was much used before the nature of infection was understood, and before it was understood that a certain amount of fever is necessary to the completion of the chemical process by which oxidation of poisonous products is accomplished. Among the febrifuges are aconite, antipyrin, acetanilid, phenacetin, and sweet spirit of nitre. Some of these are absolutely dangerous in certain fevers, as in the rise of temperature of pneumonia. Quinine is an efficient febrifuge in many cases. In typhoid fever (q.v.) and in pneumonia (q.v.) cold water is an excellent febrifuge.

FEBRIS DIA'RIA. See EPHEMERA.

FEBRONIANISM. In theology, a system of doctrine asserting the independence of national churches and the rights of individual bishops in matters of local discipline and church government—in other words, Gallicanism. (See GALLICAN CHURCH.) It holds that the final court of appeal is a general council of the church, and the Pope, as well as other prelates, is subject to its authority. The name is derived from the nom de plume, Justinus Febronius, assumed by Johann Nikolaus von Hontheim (q.v.), Coadjutor Bishop of Trèves, in a work on these subjects (1763), which led to a violent and protracted controversy.

FEBRUARY. See MONTH.

FEBRUARY REVOLUTION, THE. The revolution of 1848, which brought about the downfall of the July monarchy in France and the establishment of the Second Republic. The immediate cause was the political contest against the Guizot ministry, but the underlying factor in the situation was the dissatisfaction of all classes with the policy of stagnation of the régime of Louis Philippe and the seething discontent of the working classes with a completely bourgeois, business administration. The July monarchy had disappointed the expectations of all. It had not supplied bread for the workers, nor glory for the Patriots, nor persecution of the Church for the Voltairians, nor a clerical régime for the Catholics. The one thing it had done was to increase the possessions and power of the upper middle class. But Guizot's "enrichissez-vous" was not addressed to a large enough part of the population to keep the Orléanist monarchy in power. The very restricted property franchise and the insidious attacks on popular rights roused the Liberals and Socialists. The Republicans of the Left combined with bourgeois Socialists and with Revolutionaries of the type of Blanqui and Barbés. (See GUIZOT.) The agitation leading to the Revolution began in 1847, when the more radical factions held banquets in which a propaganda was carried on for the lowering of the tax-paying qualification for voting, which at this time was 200 francs. Gradually at these banquets the usual royal toasts disappeared, and finally, on Feb. 21-22, 1848, the government forbade a great reform banquet in Paris. The people were aroused by this arbitrary act of the ministry, and by the following day the Revolution had become an accomplished fact. Barricades sprang up everywhere in Paris, the workmen armed themselves, and Guizot was dismissed. It seemed as if the last measure would end the

disturbance; but a small riot created the impression that the government was dissembling, and matters became worse than before. In vain Louis Philippe abdicated in favor of his grandson, the Count of Paris. Nothing would satisfy the populace of Paris now but a republic, and the King, losing heart, fled (February 24). A provisional government was formed, in which the leaders were Arago, Crémieux, Blanc, and others, and by clever manipulation gained over the spontaneous radical assembly at the hotel de ville, so that the Moderates were kept in power. But they were unable to resist the demands of the proletariat and, as a concession, established a sort of Labor ministry at the Luxembourg under the presidency of Louis Blanc. National workshops were also established on Louis Blanc's suggestion to provide work for the starving workmen of Paris. On February 26 a decree was adopted, as follows: "The government of the French Republic undertakes to guarantee the existence of the workman by labor and to provide labor for all citizens," and on the following day national workshops were actually established. Laborers from all over France thronged to Paris, and the government soon found itself burdened with the support of an army of 100,000 men for whom it could find no work. No effort having been made to organize the national workshops on productive and efficient lines, on May 4 a National Assembly of 900 members was convened and intrusted the government to an Executive Committee of five members, which in its turn was to appoint the ministers. In this Constituent Assembly the more conservative Republicans obtained control. This led to violent demonstrations on the part of the Extremists. On May 15 there was an unsuccessful rising under Barbés, Blanqui, and others, having for its object the dissolution of the Assembly. The closing of the national workshops on June 21 was followed by a bloody insurrection, June 24-26, in the course of which more than 4000 workmen perished on the barricades. The Assembly on November 4 adopted a constitution for France. There was to be a president elected for a term of four years, and a single legislative chamber of 750 members. The election was in December, 1848, and the candidates for the presidency were Ledru-Rollin (Socialist), Cavaignac (Conservative), and Louis Napoleon. (See NAPOLEON III.) The last carried the election; for the charm of the great Napoleon's name was on the increase in France, now that the glories of his reign were remembered and the evils long forgotten. By electing the head of the Imperialist party, the country virtually decreed the downfall of the Second Republic. See FRANCE.

In other countries of Europe the February Revolution had a marked effect. Throughout the whole Continent the cause of popular liberty had been suffering from the policy of Metternich (q.v.), and the news from Paris proved to be the impetus necessary to arouse the people. Especially was this true of Germany and Austria. In the former country an attempt was made to carry out the union, which had been hoped for in 1815; but though a parliament assembled at Frankfort, 1848-49, it produced no lasting results. In some of the individual states, notably Prussia, constitutions were obtained, which never again disappeared entirely. In Austria Metternich was overthrown, and

for a long time Austrian supremacy in Italy and Hungary was seriously menaced. See GERMANY; PRUSSIA; AUSTRIA-HUNGARY; ITALY. Consult: Stein, *Geschichte der sozialen Bewegung in Frankreich* (Leipzig, 1850); Haym, *Die deutsche Nationalversammlung* (3 vols., Berlin, 1848-50); Louis Blanc, *Histoire de la révolution de 1848* (Paris, 1870); *La révolution de février au Luxembourg* (ib., 1849); Lamartine, *Histoire de la révolution de 1848* (ib., 1859); Thomas, Emile, *Histoire des ateliers nationaux* (ib., 1848); Weill, G., *Histoire du parti républicain en France de 1814 à 1870* (ib., 1900); Blanqui, *Les classes ouvrières en France pendant l'année 1848* (ib., 1849); Robinson and Beard, *Development of Modern Europe* (2 vols., New York, 1910).

FEBRUUS. An epithet of Faunus (q.v.), conceived of as a god of purification and, through such purification, of fertility in man and beast. The ceremony itself, called *februa*, was held on February 15; *Februarius (Mensis)* was the "month of purification." In it occurred the great festival in honor of the dead, the *Parentalia*. Later the Romans made Februs an independent god and worshiped him also as a god of the lower world and identified him with the Greek Pluto. Consult Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

FEBVRE, févr', ALEXANDRE FRÉDÉRIC (1835-). A French comedian, after 1867 a member of the Comédie Française. He was born in Paris and was a musician till he was called above the footlights to fill, it is said, an accidental vacancy. He played for a time in Havre, then in Paris, chiefly at the Ambigu, Beaumarchais, Porte-Saint-Martin, Gaité, Odéon, and Vaudeville theatres. At the Odéon, especially, he created rôles in *Daniel Lambert* and *Le rocher de Sisyphe*. Having won a reputation, he made, in 1860, his début at the national theatre, as Philippe II in *Don Juan d'Autriche*. His most frequent successes were in modern comedy, among his creations being rôles in *L'étranger*, *L'ami Fritz*, *Daniel Rochat*, *Les corbeaux*, *Le roi s'amuse*, and *Margo*. In 1894 he made a tour of the principal cities of Europe. The following year he was sent to the United States to make a study of the American stage. His published works include: *Au bord de la scène* (1890); *Le journal d'un comédien* (1896); *La clef des champs* (1899); *Le roman d'un m'as-tu-vu*.

FÉCAMP, fâ'kâs' (OF. *Fescamp*, Lat. *Fiscannum*; derived by popular etymology from Lat. *Ficus Campus*, Fig Plain, on account of a legend that a fig tree, in which some of the precious blood of Christ had been placed by Joseph of Arimathea, was washed ashore there). A manufacturing town and seaport in the Department of Seine-Inférieure, France, situated in a narrow valley of the Fécamp, flanked on either side by steep cliffs, on the English Channel, 23 miles northeast of Havre (Map: Northern France, F 3). Its principal buildings are the abbey church of the Benedictines, in the early Pointed eleventh to sixteenth century style; a pilgrimage chapel, Notre Dame du Salut; the church of Saint Etienne, a museum, a library of 12,000 volumes, and a hospital. The harbor is a port of entry for English colliers and Baltic timber ships and fishing vessels. Fécamp has cotton mills, foundries, cordage works, agricultural machinery works, tanneries, oil mills, distilleries and textile factories.

It has also large herring fisheries. Pop. (commune), 1901, 15,381; 1911, 17,383. The town was built up from a convent founded in 664, which was destroyed in 841 by the Northmen. In 998 Richard I, Duke of Normandy, rebuilt it as a Benedictine abbey.

FECHNER, fê'knër, GUSTAV THEODOR (1801-87). A German physicist and philosopher, the founder of modern psychology and psychophysics. He was born in the village of Gross-Särchen, near Muskau, in Lower Lusatia. After completing his school education at the Kreuzschule, in Dresden, Fechner in 1817 entered the University of Leipzig as a student of medicine. Disappointed at the unscientific character of his medical teaching, and strongly influenced by Oken's *Naturphilosophie* and Biot's *Physics*, he soon turned his attention to the study of theoretical and experimental physics, and after Gilbert's death, in 1824, lectured as a substitute for the professor. From this date till 1845 he made valuable contributions to the doctrine of electricity, his well-known *Massbestimmungen über die galvanische Kette* being issued in a single volume in 1831. In 1833 he was appointed associate professor and in 1834 full professor of physics in the University of Leipzig. In 1838-40 he was engaged upon investigations in the sphere of physiological optics. Meantime he had, under the pseudonym of Dr. Mises, published a long series of humorous and satirical essays, of which we may mention the *Proof that the Moon is Made of Iodine* (1821), a sharp arraignment of the existing state of materia medica, and the *Comparative Anatomy of the Angels* (1825), a work of delicate humor, containing in germ many philosophical ideas which were later put forward with serious intention. In 1839 Fechner published a notable piece of art criticism, and in 1841, as Dr. Mises, a volume of lyric poetry. The years 1840-43 were spent, for the most part, in the sick room—Fechner had broken down nervously and was threatened both with blindness and with insanity. His recovery, when it set in, was rapid and complete. He now turned his thought towards philosophy, and issued in 1846 an ethical treatise, *Ueber das höchste Gut*. This was followed in 1848 by the curious but most suggestive work, *Nanna, oder über das Seelenleben der Pflanzen*, in which mentality, of however low an order, is ascribed to the plant world, and this in turn by the *Zend-Avesta, oder über die Dinge des Himmels und des Jenseits* (1851), in which Fechner set forth a comprehensive system of metaphysics from the standpoint of natural science. Here we find the fundamental ideas of what was later to be elaborated as psychophysics. Finally, the work *Ueber die physikalische und philosophische Atomlehre* (1855) marks Fechner's definitive rupture with the speculative nature philosophy of Schelling and his school. The remaining years of Fechner's life (1860-87) were devoted principally to the study of psychology and aesthetics. In 1860 appeared the epoch-making *Elemente der Psychophysik* (reprinted, 1889, 1907). We have seen that as early as 1838 Fechner was busied with psychophysical problems, and the general question of the relation of mind to body had long held his attention.

The new science called forth lively discussion, and Fechner's personal views evoked much opposition. In 1877 he published *In Sachen*

der Psychophysik, a reply to objections by Helmholtz, Mach, Brentano, and others, and in 1882 the *Revision der Hauptpunkte der Psychophysik*, a reply to G. E. Müller's *Grundlegung der Psychophysik* (1878). In 1871 appeared *Zur experimentalen Ästhetik*, and in 1876 the profound and comprehensive work, *Vorschule der Ästhetik*. In 1879 came *Die Tagesansicht gegenüber der Nachtsicht*, a summary of the author's religious and metaphysical beliefs. Fechner's last piece of published work was, characteristically enough, an article on Weber's law (q.v.), printed in Wundt's *Philosophische Studien* (Leipzig, 1887). He died in Leipzig, Nov. 18, 1887. An important mathematical treatise, the *Kollektionslehre*, was issued posthumously, under the editorship of G. F. Lipps (1897).

Fechner's general philosophy has not as yet received the attention that it deserves. His aesthetic work, on the other hand, has borne rich fruit. But his enduring fame will, of course, rest upon the *Psychophysik*. In this work he laid, once and for all, the foundations of an exact psychology. But he did more. He worked out a series of psychophysical measurement methods (see PSYCHOPHYSICS) which are those still employed in our psychological laboratories. He carried out extended researches, which are not only models of scientific patience and caution, but also permanent contributions to the literature of psychology. He levied tax upon all departments of scientific inquiry (see PSYCHOLOGY, EXPERIMENTAL) for facts and laws which might bear upon the psychophysical relation, bringing order and consistency into the chaos of separate observations.

Consult: Kuntze, *Gustav Theodor Fechner: ein deutsches Gelehrtenleben* (Leipzig, 1892); Lasswitz, *Gustav Theodor Fechner* (Stuttgart, 1896); and for a bibliography of Fechner's works, Fechner, *Elemente der Psychophysik*, i (3d ed., Leipzig, 1907).

FECHTER, fĕk'tĕr, CHARLES ALBERT (1824-79). A noted actor. He was born probably in London (though accounts from another source say Paris), his father being of German and his mother of Italian descent. He was educated in France, and in 1840 appeared in private theatricals; in 1841 he went with a strolling company to Italy, returning to Paris the same year and entering the Conservatoire with a view to the Théâtre Français. At the same time he studied sculpture, but gave it up for the stage, and in 1844 made his début at the Théâtre Français as Seide in Voltaire's *Mahomet*. Afterward he played in Berlin, and in 1847 took a French company to London. In 1847 he married Mlle. Éléonore Rabut, a French actress of note. (She died in 1895.) From 1848 to 1860 he was the reigning favorite in Paris. He was the original Armand Duval in *La dame aux camélias*, in which part he won remarkable success. In 1860 he made his first appearance in English drama in London, in *Ruy Blas*, following with *Corsican Brothers*, *Don César de Bazan*, *Hamlet*, *Othello*, *Bel Demonio*, and other plays, among them an adaptation of his own called *Rouge et Noir*. While not altogether at home on the English stage, Fechter showed himself capable of appreciating the difficulties he had to contend with and, in some measure, of surmounting them. His impersonation of Hamlet was, upon the whole, one that marked him as an actor of very high powers. For a

time he was the lessee of the Lyceum Theatre, playing the chief parts in most of the pieces produced. In 1870 he came to the United States, where, except for a brief return to England two years later, he thenceforward remained. He met with great success as an actor, particularly in Boston; but his imperious temper made him so many enemies that his attempts to manage theatres in both Boston and New York were speedy failures. In 1874, though his first wife was still living, he was married to Lizzie Price, an American actress with whom he had appeared in New York. In 1876, after an accident which somewhat disabled him, he retired to a farm near Quakertown, Pa., where he died. Consult Field, *Charles Albert Fechter* (Boston, 1882).

FECKENHAM, JOHN DE (c.1518-85). The last abbot of Westminster and the last mitred abbot who sat in Queen Elizabeth's Parliament. He was born in Feckenham Forest, Worcestershire, about 1518, and his family name was Howman. He became a monk at Evesham, and there took the name by which he is now known. He studied at Oxford. After holding other positions, in 1543 he became chaplain to Bonner, Bishop of London, and when the latter was deprived of his see, Feckenham was sent to the Tower (1549). Although for much of the time a prisoner, he was active in political matters. Queen Mary released him and made him her chaplain (1553). In 1556 Queen Mary refounded the Benedictine monastery of St. Peter, Westminster, London, and made him mitred abbot. Elizabeth was personally friendly to him, but would do nothing for him, as he would not conform to the new (Protestant) faith. All his influence was thrown against the Reformation and its doctrines. In 1559 he was removed and sent to the Tower in 1560, and though released on bail in 1574, was practically a prisoner till his death, at Wisbech, near Ely, in 1585. Consult Taunton, *English Black Monks of St. Benedict* (London, 1897).

FECUNDATION, IN PLANTS. See FERTILIZATION.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.

A body which held its first meeting in Philadelphia in 1908 and was largely the culmination of previous voluntary federative movements, the chief of which had been the Evangelical Alliance and the National Federation of Churches and Christian Workers. The important preliminary work leading up to the organization was accomplished by the Interchurch Conference on Federation, a body composed of official delegates from 30 denominations, which met in New York City in 1905. This conference adopted the constitution of the Federal Council and transmitted it to the various denominations with the understanding that approval by two-thirds of them would give it full effect. This approval was secured early in 1908. The difference between the Federal Council and the previous movements is that it is not an individual or voluntary agency or simply an interdenominational fellowship, but is an officially and ecclesiastically constituted body. It is differentiated from other general movements for the manifestation of Christian unity in the fact that it is the coöperation of the various denominations for service rather than an attempt to unite them upon definitions of theology and polity. The Federal Council

has no authority over the constituent bodies adhering to it, and its province lies in the expression of its counsel and the recommending of a course of action in matters of common interest to the denominational bodies, the churches, local councils, and individual Christians. It has no authority to draw up a common creed or form of government or of worship, or in any way to limit the full autonomy of the Christian bodies adhering to it. The council meets quadrennially and consists of about 400 qualified delegates officially elected by the various denominational assemblies or other constituted authorities.

The work undertaken by the council is indicated by the titles of its most important commissions, which are as follows: State and Local Federations, Foreign Missions, Home Missions, Religious Education, Social Service, Evangelism, Family Life, Sunday Observance, Temperance, and Peace and Arbitration. The Commission on the Church and Social Service also has a Committee on Church and Country Life. Other special commissions, such as the Joint Commission on Theological Seminaries, on Interdenominational Movements, and on International Relations, are appointed from time to time to take up special activities calling for united action upon the part of the churches.

The Commission on the Church and Social Service is perhaps the most conspicuous of the departments of the council in its relation to the public at large. Among the specific principles for which it asserts that the Church must stand in its relation to labor are the following: (1) the gradual and reasonable reduction of hours of labor to the lowest practicable point, and that degree of leisure for all which is a condition of the highest human life; (2) a release from employment one day in seven; (3) a living wage as a minimum in every industry, and the highest wage that each industry can afford.

While the Federal Council is constituted solely of the national denominations, it has a co-operative relationship with State and local federations. There were, in 1914, 21 State federations and about 130 city and county federations. Among the investigations made by the different commissions of the council are reports on the Country Church, on Industrial Conditions in Several Cities, and on the Church and Modern Industry. The council in 1913 had charge of the collection of religious statistics under the direction of Dr. H. K. Carroll. The constituent bodies of the council are as follows: Baptist Churches (North), National Baptist Convention, Free Baptist Churches, Christian Church, Congregational Churches, Disciples of Christ, Friends, German Evangelical Synod, Evangelical Association, Lutheran Church (General Synod), Mennonite Church, Methodist Episcopal Church, Methodist Episcopal Church (South), African M. E. Church, African M. E. Zion Church, Colored M. E. Church in America, Methodist Protestant Church, Moravian Church, Presbyterian Church in the U. S. A., Presbyterian Church in the U. S. (South), Protestant Episcopal Church Commissions on Christian Unity and Social Service, Reformed Church in America, Reformed Church in the U. S., Reformed Episcopal Church, Reformed Presbyterian Church (General Synod), Seventh Day Baptist Church, United Brethren Church, United Evangelical Church, United Presbyterian

Church, Welsh Presbyterian Church. The National Offices are at 105 East 22d Street, New York City. The general secretary in 1914 was Rev. Charles S. Macfarland.

FEDERAL GOVERNMENT (Lat. *fœderatus*, bound by treaty, from *fœdus*, a treaty). When two or more states, otherwise independent, bind themselves together by a treaty or an organic act so as to present to the external world the aspect of a single state, without wholly renouncing their individual powers of internal self-government, they are said to form a federation. The contracting parties are sovereign states acting through their representatives, and the extent to which the central overrules the local legislature is fixed by the terms of the contract. In so far as the local sovereignty is renounced and the central power becomes sovereign within the limits of the federated states, the federation approaches to the character of a nation; but the only renunciation of sovereignty which a federation, as such, necessarily implies consists in abandoning the power which each separate state otherwise would possess of forming independent relations with foreign states. "There are," says J. S. Mill, "two different modes of organizing a federal union. The federal authorities may represent the governments solely, and their acts may be obligatory only on the governments as such, or they may have the power of enacting laws and issuing orders which are binding directly on individual citizens. The former is the plan of the German so-called confederation, and of the Swiss Confederation previous to 1847. It was tried in America for a few years immediately following the War of Independence. The other principle is that of the existing Constitution of the United States, and has been adopted within the last dozen years by the Swiss Confederacy. The Federal Congress of the American Union is a substantive part of the government of every individual State. Within the limits of its attributions it makes laws which are obeyed by every citizen individually, executes them through its own officers, and enforces them by its own tribunals. This is the only principle which has been found, or which is even likely, to produce an effective federal government. A union between the governments only is a mere alliance, and subject to all the contingencies which render alliances precarious."

The difference between these two dissimilar forms of federation is aptly described by the terms employed in German political philosophy to differentiate them, and for which we have no equivalent terms in English—*Staatenbund*, a federation of states, and *Bundesstaat*, a federated state. The federal governments of antiquity and of the Middle Ages were all of the former type, loosely knit confederacies, like those of Athens and the ephemeral combinations of petty Italian states in the thirteenth and fourteenth centuries. Of a similar character is the union of two or more states under a single monarch, as of Castile and Aragon under Ferdinand and Isabella, Austria and Hungary under Francis Joseph, and the union of Sweden and Norway, which was dissolved in 1905. Confederations of this character have generally proved to be unstable and of short duration, and none of those at present in existence seems likely to prove an exception to this rule. It is to the more enlightened political consciousness of modern

times, and especially to the institution of representative popular governments, that the more durable type of federal government—the federated state—owes its existence. The formation of the United States of America under the present Constitution was the first attempt to realize this form of federation on a scale large enough to command the attention of the world, and the great success of the experiment of combining local independence with national power has impressed itself upon the political consciousness of Christendom. Thus, just as the British constitution has become the model of representative government for the nations of western Europe, the American federation has become the type of federal government for two continents.

One of the chief difficulties which arises in organizing a federal government of either type consists in discovering means by which disagreements between one or more of the local governments and the central government as to the limits of their respective powers are to be disposed. The arrangement by which this object was sought to be effected in America, of which Tocqueville expressed his admiration, is thus explained by Mill: "Under the more perfect mode of federation, where every citizen of each particular State owes obedience to two governments—that of his own State and that of the federation—it is evidently necessary not only that the constitutional limits of the authority of each should be precisely and clearly defined, but that the power to decide between them in any case of dispute should not reside in either of the governments, or in any functionary subject to it, but in an umpire independent of both. There must be a supreme court of justice, and a system of subordinate courts in every State of the union before whom such questions shall be carried, and whose judgment on them, in the last stage of appeal, shall be final. Every State of the union, and the federal Government itself, as well as every functionary of each, must be liable to be sued in those courts for exceeding their powers, or for nonperformance of their federal duties, and must in general be obliged to employ those courts as the instrument for enforcing their federal rights. This involves the remarkable consequence, actually realized in the United States, that a court of justice, the highest Federal tribunal, is supreme over the various governments, both State and Federal, having the right to declare that any new law made or act done by them exceeds the powers assigned to them by the Federal Constitution, and, in consequence, has no legal validity." The tribunals which act as umpires between the federal and state governments naturally also decide all disputes between two states, or between a citizen of one state and the government of another. The usual remedies between nations—war and diplomacy—being precluded by the federal union, it is necessary that a judicial remedy should supply their place. The supreme court of the federation dispenses what is in effect international law, and is the first great example of what is now one of the most prominent wants of civilized society—a real international tribunal.

A federal government, then, is a body politic composed of the people of several different, and in some respects independent, states, over which, in its own prescribed sphere, it exerts a

supreme authority; while outside of that sphere the states and the people thereof are sovereign within their respective jurisdictions. The character of a federal government varies with the extent of its powers. The first form of federal government established in the United States was that created by the Articles of Confederation, adopted by the Continental Congress in 1777. The separate Colonies, finding some form of central government indispensable to the efficient prosecution of the War of Independence, gave a reluctant consent to those articles, which, while the war lasted and all felt the presence of a common danger, worked tolerably, though not without some embarrassing friction arising from notions of Colonial or State sovereignty. But after the independence of the country was established, and the pressure of a common danger no longer existed, there was a disposition to exalt the State and to depreciate the national authority, which to some extent was regarded as a burden. The national government had no judicial tribunal to make an authoritative exposition of its powers, and no executive officers to enforce its decrees; it was entirely dependent upon the voluntary action of the States for means to carry on its operations; so that, in the language of Washington, it was "little more than a shadow without the substance," and "Congress a nugatory body, their ordinances being little attended to." There was, in short, an utter want of all coercive authority on the part of the government to carry into effect its own constitutional measures. The embarrassments growing out of this state of things were endured till 1787, when a convention of delegates from the several States was held in Philadelphia, "for the purpose of revising the Articles of Confederation and reporting to Congress and the several legislatures such alterations and provisions therein as shall, when agreed to in Congress and confirmed by the States, render the Federal Constitution adequate to the exigencies of the Government and the preservation of the Union." The convention encountered many difficulties arising from diversities of opinion among its members and from conflicting local interests, but finally succeeded in framing a constitution which the people of the several States ratified, and which, with various amendments, has continued to this day. From the time of its adoption different theories of interpretation have prevailed, and these conflicting theories have to a greater or less extent determined the character and aims of political parties. It has been contended on the one side that the Union was merely a league between the several States in their organized capacity, and that each State had the right, at its pleasure, of withdrawing therefrom. On the other side it has been held that the Union, instead of being the creation of the States, as such, was formed by "the people of the United States," acting, indeed, through their respective State organizations, but still as citizens of a common nationality. According to this theory, no right of secession on the part of a State has any existence; but it is the right and the duty of the national government to maintain the Union by force. This question was brought to an issue in the Civil War, the slaveholding States seeking to exercise the assumed right of secession for the protection of slavery, and the nonslaveholding States taking up arms for the defense of the Union. The re-

sults of the war are generally regarded as a vindication of the antiseccession theory, though there are still some disputed questions as to the relative powers of the national and State governments. See *Articles of Confederation*, under UNITED STATES; CONSTITUTION OF THE UNITED STATES.

Other modern examples of federal government are afforded by the Dominion of Canada, founded in 1867 by a union of the provinces of Upper and Lower Canada, New Brunswick, and Nova Scotia, and afterward enlarged by the accession of the provinces of Manitoba, British Columbia, Alberta, and Saskatchewan, and Prince Edward Island; by the Commonwealth of Australia, established in 1901 by the organic union of the several Australian colonies of Great Britain; and by the present German Empire, which was born of the sentiment of German nationality evoked by the Franco-Prussian War in 1870-71. See CONSTITUTION; DEMOCRACY; GOVERNMENT; SOVEREIGNTY.

Consult: Mill, *Considerations on Representative Government* (London, 1905); De Tocqueville, *Democracy in America* (2 vols., New York, 1898); Bryce, *The American Commonwealth* (rev. ed., 2 vols., ib., 1912); Burgess, *Political Science and Comparative Constitutional Law* (2 vols., Boston, 1902).

FEDERALIST, THE. A series of essays issued in 1787 and 1788 in favor of the adoption of the proposed Federal Constitution for the United States. The Constitutional Convention at Philadelphia adjourned Sept. 17, 1787; the text of the new Constitution was first published in New York on September 27; and on October 27 the first number of the *Federalist* appeared in the *Independent Journal*, a semi-weekly newspaper of New York, the successive essays continuing to appear therein until April 2, 1788. All of the 85 essays (the concluding eight of which did not appear until the *Federalist* was printed in book form) were published over the name of "Publius," but they were composed severally by Alexander Hamilton, James Madison, and John Jay. The authorship of several of the numbers has been the subject of prolonged and inconclusive discussion, but the chief credit for the conception of the enterprise and for its execution has at all times been given to Hamilton. In newspaper and in pamphlet form the *Federalist* had a wide circulation, and its influence was conspicuous in turning popular opinion in favor of the Constitution. Especially in New York, to whose inhabitants it was particularly addressed, it was an important factor in the conversion of the State from antifederalism to federalism. No contemporary exposition of the text of the Constitution, of the purposes of its framers, and of its relation to the actual development of the State was so complete, so scholarly, or so authoritative as was that in the *Federalist*. It has, consequently, become recognized, even by the courts, as the most reliable commentary on the Constitution and as an essential aid in the interpretation of such passages as are of obscure or disputed meaning. Many editions have been published; the latest and most useful (containing for the first time a full index of the essays) is that by Paul L. Ford (New York, 1898). In the edition edited by John C. Hamilton (Philadelphia, 1875) there is an elaborate essay on the authorship of the several papers. The discussion is al-

most as interesting to the antiquary as that concerning the identity of "Junius." Useful editions have also been published by H. B. Dawson (New York, 1864), H. C. Lodge (ib., 1888), and by E. H. Scott (Chicago, 1895). On the authorship of the *Federalist*, see also Bourne and P. L. Ford, in the *American Historical Review*, vol. ii (New York, 1897).

FEDERALISTS. In American history, the name given to those who in 1787 and 1788 advocated the adoption of the new Constitution of the United States, and who later contended, for the most part, for a liberal construction of the Constitution and the establishment of a strong national government. In the end Washington undoubtedly favored their views; but Hamilton, with his plans for a national bank, a sinking fund, the assumption of State debts, and the encouragement of manufactures, was the real leader of the Federalists, while Jay, John Adams, Gouverneur Morris, Ames, and later Marshall were prominent members of the party. The Federalists were conservative in their belief in popular government and had little sympathy with the French Revolution, being upon these two, as upon other points, opposed by the strict constructionists under the leadership of Jefferson and Madison, known as the Republicans, or Democratic Republicans. (See DEMOCRATIC PARTY.) The Federalists controlled the first three administrations—those of Washington and of John Adams—but the party was disrupted by factional controversies during Adams's administration, and was overthrown by the Republican victory of 1800, which placed Jefferson in the presidential chair. Their candidates for President from 1804 to 1816 received scarcely any support outside of New England, and in 1820 no Federalist nomination was made. During these years the party was kept alive in New England by those who had opposed Adams's administration, and who formed the most aristocratic and pro-English faction. (See ESSEX JUNITO.) Their opposition to the Embargo and kindred measures, and to the War of 1812, culminated in the Hartford Convention (q.v.) in 1814. The convention was immeasurably denounced, and was fatal to the little life still left in the Federalist party. One of the last appointments of President Adams was that of John Marshall as Chief Justice of the Supreme Court, and during his tenure of that office Marshall succeeded in stamping indelibly upon the Constitution the best portions of the Federalist doctrine. Moreover, the Republicans in power gradually became scarcely less liberal in their interpretation of the Constitution than the Federalists had been before them; and while in 1798 the Federalists denounced the Virginia and Kentucky resolutions (q.v.) passed by the Republicans in favor of State's rights, in 1814 the Federalists were vigorously opposed to any extension of the authority of the central government, while the Republicans were wholly committed in this respect to the former Federalist policy. Consult Bassett, *The Federalist System* (New York, 1906), and Morse, *The Federalist Party in Massachusetts to the year 1800* (Princeton, 1909).

FEDERAL THEOLOGY. The designation of a type of Calvinism which developed in Holland during the latter part of the seventeenth century and spread to England. Its chief exponents were Johann Koch (d. 1669), Franz

Burmann (d. 1679), Hermann Wits (d. 1708), and perhaps one should add Vitringa (d. 1722). The theological system taught by these scholars was in general a system of covenants (*fœdera*), conceived as being made between God and man, whence the name "federal theology." Koch (or Cocceius) (q.v.), as he is commonly known, professor at Franeker, and afterward at Leyden, is usually regarded as the founder of the school; but the federal idea did not originate with him. Something similar had been taught by Olevianus, one of the framers of the Heidelberg Catechism, by the Swiss theologian Eglin (in his *De Fœdere Gratia*, 1613), and by William Ames, an English Puritan, who was professor at Franeker in Koch's student days. John Ball's *Treatise of the Covenant of Grace* proves the early currency in England of a federal system, and it is adopted in the Westminster Confession of Faith (chap. vii). It accounted for God's condemnation of man for original sin, and took the place of Augustine's theory of the unity of human nature in Adam.

Koch started with the biblical history of redemption, which he arranged under what he called covenants. By the term "covenant" he meant a promise on God's part, conditioned upon obedient acceptance of the promise by man. It is a gift rather than a contract. There can be nothing like a *quid pro quo*, for God's part is infinite and man's finite. As developed by Burmann, the federal system includes: (1) *The Covenant of Works*, made with Adam as the federal head of the race. God would give man eternal felicity, upon condition that man should remain in his first estate of holiness. This covenant was broken by the fall and was replaced by (2) *The Covenant of Grace* between God and fallen man. Man was not released from his former obligation to obedience, although, owing to the fall, he was rendered incapable of performing it. Hence God in His mercy substitutes grace for works. But in order to render this new covenant possible, God is obliged to send His Son, Jesus Christ, to supply the obedience lacking on the part of fallen man, and to be the full divine sacrifice for sin. This second covenant is arranged in three "economies"—viz., (a) the antelethal, or the grace promised to the patriarchs; (b) the legal, presented in the Mosaic system of laws and ceremonies, which are all typical; and (c) the postlegal, including the advent of Christ on earth and the whole of Christian history. To complete the scope of the federal theology, its ruling idea was projected back into eternity by the transcendental conception of a covenant between the persons of the Trinity, whose aim was the creation and redemption of man. This gave a series of three covenants, under which all history, divine and human, might be subsumed. It constituted a philosophy of history on the basis of an assumed divine plan. This threefold system is a later development from Koch's teaching.

The ideas of Koch and his school were distasteful to the orthodox Calvinists, for they shifted the emphasis away from predestination. Hence the federal theologians were always under suspicion, and sometimes were openly charged with heresy. Koch himself narrowly escaped condemnation. Their chief service to the advancement of Christian thought consists in having broken with scholastic Protestantism and, in fidelity to the genuine Reformation

principle, having once more directed men's minds to the Scriptures themselves. They are not improperly represented as leaders in the study of what is now called biblical theology. Wits (Witsius) and Vitringa are justly honored as the foremost Old Testament scholars of their day. Consult: Cocceius, *Opera Omnia* (Amsterdam, 1673-75; 3d ed., 1701); Zoványi, *Geschichte des Coccejianismus* (Budapest, 1890); Fisher, *History of Christian Doctrine* (New York, 1896).

FEDERATED MALAY STATES. A federation of native states, under British protection, spanning the Malay Peninsula between Kedah, Siam, Kelantan, and Trengganu on the north and Malacca and Johore on the south. The states, with their area, their population according to the 1911 census, and their administrative headquarters, are as follows:

	Sq. Miles	Pop., 1911	Head-quarters
Perak.....	7,800	494,057	Taiping *
Selangor.....	3,156	294,085	Kuala Lumpur
Negri Sembilan..	2,550	130,199	Seremban
Pahang.....	14,000	118,708	Kuala Lipis †
The Federation	27,506	1,036,999	Kuala Lumpur

* The native capital is Kuala Kangsar.

† The native capital is Pekan.

The population included 420,840 Malays, 433,244 Chinese, 172,465 natives of India, 3284 Europeans and Americans, and 2649 Eurasians. Males numbered 725,062, and females 311,937, the great preponderance of the former being due to Chinese immigration. Total immigrants and emigrants in 1909 were 570,411 and 500,172 respectively; in 1910, 305,803 and 237,438. The country is generally fertile and well watered. Parts are mountainous; mountains on the east boundary of Perak exceed 7000 feet in height; in Selangor there are several peaks of over 5000 feet and one of 5812 feet; on the Pahang-Kelantan boundary Gunong Tahan reaches a height of 7186 feet and is probably the highest point in the Malay Peninsula, the second highest being Gunong Korbau, on the Pahang-Perak boundary. The states produce coconuts, rubber, rice, sugar, tapioca, pepper, gambier, etc. The states have valuable mineral deposits, and their output of tin is the largest in the world. In 1910 imports and exports were valued, in Straits Settlements dollars (par value 56.776 cents), at 47,843,541 and 102,851,000 respectively; in 1911, 66,532,030 and 116,280,927. The export values of rubber, tin, and tin ore respectively were as follows in 1911: Perak, 10,994,087, 9,188,008, and 31,946,988 dollars respectively; Selangor, 23,852,273, 5,097,877, and 16,643,259; the Negri Sembilan, 5,039,968, 8517, and 2,741,591; Pahang, 28,319, 1,436,156, and 2,693,819. At the end of 1912 the Federated Malay States Railways had a mileage of 614 in operation (including 23 miles in Province Wellesley and 21 in Malacca). In addition 120 miles had been constructed and are worked in Johore by the company. The main line connects Prai, on the mainland opposite Penang, with Johore Bharu, opposite Singapore, and steam ferries at each end complete the connection between Penang and Singapore. There are several branch lines. The total revenue and expenditure of the states in 1910 were 26,553,318 and 23,598,610 dollars

respectively; in 1911, 35,056,544 and 25,202,749. The British protectorate began in 1874, when, as a result of prevailing anarchy, especially in Perak, British residents were stationed in the states of Perak, Selangor, and Sungei Ujong (now one of the Negri Sembilan, "nine states"). The supreme authority in each state is vested in the state Council, which is presided over by the native sultan or ruler, who is assisted by the British Resident. In 1909 a federal council was created by an agreement between the British High Commissioner for the Malay States (who is also Governor of the Straits Settlements) and the four native rulers. The Council includes the High Commissioner, as president, the Chief Secretary, the sultans of Perak, Selangor, and Pahang, the yam tuan of the Negri Sembilan, the four British residents, and four unofficial members nominated by the High Commissioner. The Council, which meets at least once a year, considers the drafts of laws which are to apply to more than one state, and the annual estimates of the revenue and expenditure of the four states. Consult Swettenham, *British Malaya* (London, 1908).

FEDERATION OF LABOR, AMERICAN. See LABOR, AMERICAN FEDERATION OF.

FEDERMANN, fä'dër-män, NIKOLAUS (1501-c.43). A German traveler in South America. He was born at Ulm, Swabia. In 1529 he was sent to Venezuela in command of an expedition of 129 Spanish soldiers and 24 miners in the employ of the Welsers, merchants of Augsburg, to whom the Emperor Charles V had granted Venezuela. Up to the year 1532 he was engaged in extensive explorations in the interior of that country, the results of which he published in the work entitled *Indianische Historia* (1557; Fr. trans. in the Ternaux-Compans collection, 1837). In 1537 he again visited Venezuela as the lieutenant of George of Speyer, then Governor-General, and entered upon a second expedition which brought him to New Granada. He was brave, but rapacious and cruel.

FEDERN, fä'dern, KARL (1868-). A German author and translator, born and educated in Vienna. In 1891-94 he practiced law, but thereafter devoted himself entirely to literature, living in Vienna, Berlin, London, and Italy, and writing on Italian literature, especially Dante, and on American and French literature. He published German versions of Emerson's *Essays* (1894) and *Representative Men* (1906), of Whitman's *Leaves of Grass* (1904), and of St. Evremond's works (1912); and he wrote *Essays zur amerikanischen Litteratur* (1899), *Dante* (1900), *Dante and his Time* (1902), *Essays zur vergleichenden Litteraturgeschichte* (1904), and several novels and romances.

FEDI, fä'dè, PRO (1815-92). An Italian sculptor. He was born at Viterbo and studied engraving at the Academy of Vienna; but after practicing this art for a short time he turned to sculpture, which he studied at the Florence Academy and in Rome, making his artistic début there with "Christ Healing the Sick." In 1846 he was employed by Leopold II, Duke of Tuscany, for whom he executed the statues of Niccola Pisano and Andrea Gessalpino (on the façade of the Uffizi), which are somewhat lacking in personality; and in 1852 he carved the funeral monument of the daughter of the Russian general Swov. His other works include

the monument to the poet Nicolini in Santa Croce; the fine figure of "Sacred Poetry," in the Museo Civico, Verona; and his masterpiece—the "Rape of Polyxena," which was placed with the antique and Renaissance sculptures in the Loggia dei Lanzi in 1866. It is a group of four figures in the antique style, executed with great technical ability.

FEDORA, fä'dò'rá. A popular play by Sardou, produced in 1882. The title character is among the rôles of Sarah Bernhardt.

FEDTCHENKO (also spelled FEDCHENKO), fäd-chén'kò, ALEXEI PAVLOVITCH (1844-73). A Russian naturalist and traveler. He was born in Irkutsk, was educated at the University of Moscow, and in 1868-71 made a journey for study and exploration to Turkestan and the lower course of the Sir-Darya or Jaxartes. He made detailed investigation and maps of the Maghian district on this journey. In 1871 he accomplished a second journey to the desert of Kizil-Kum and to Khokan, proceeding to the western end of the Terek-Davan Pass. He was killed during an ascent of Mont Blanc. The scientific results of his expeditions were published in Russian at St. Petersburg (1873-76).

FEE, FIEF, or FEUD (AS. *feoh*, Goth. *fahn*, cattle, property; connected with Lat. *pecus*, Skt. *paśu*, cattle). In the feudal system of land tenure, a freehold estate in land, held of another and in subordination to certain paramount rights of the latter. These rights, taken together, constituted lordship of the land, while the interest of the subordinate owner was described by the term "freehold" (*liberum tenementum*), or tenancy. This relation of landlord and free tenant was the correlative of the personal relation of lord and vassal, upon which it was founded, and which it gradually superseded. The lord owed his vassal protection and justice, in return for which he exacted loyal allegiance, and the performance of certain services in accordance with the station and means of the vassal. In the course of time, when the lords became great landowners, these services came to be connected with the lands granted by them to their vassals, and then the lands were regarded as held by such and such services, and the different forms of freehold tenure were described by the service appropriate to each, as the tenure of knight's service, the tenure of grand sergentry (or grand service: *magnum servitium*), the tenure of free and common socage (i.e., the service of socmen), etc. See FEUDALISM; TENURE.

Understood in this feudal sense—of lands held of a superior lord by some definite service or duty—the fee stands in contrast to the allodial or absolute ownership of land, free from any obligation of service or any relation of vassalage to a superior lord. It is doubtful how far this conception of absolute and independent ownership of lands was ever realized in practice in the Middle Ages; certainly there was none of it in England after the ascendancy of the feudal system had become complete. See ALLODUM.

As the term "fee" stood for land held in any form of freehold tenure of a superior lord, it was originally applicable to such land, whatever the estate of the tenant might be. Probably the earliest fees were for the life of the tenant only, but the lord might and often did grant them to the tenant "and his heirs," in which case they became estates of inheritance. Before long, however, the term "fee" changed its meaning. As

early as the thirteenth century it was commonly used in the sense of an inheritable estate, and this has continued to be its signification to the present day. It no longer denotes an estate held of another, as distinguished from an estate which owes no duty to any superior, but any estate, whether feudal or allodial, which is capable of transmission to the heirs of its owner. But its quality of heritability still depends in common-law jurisdictions on the use of words of inheritance in the instrument creating the estate. A gift to John Doe "absolutely and forever," or to him "and his assigns forever," will vest in him only a life estate, while a grant to one and his heirs will give him a fee. This technical rule has been abrogated by statute in most of the United States, and the more reasonable rule substituted that the intention of the grantor shall govern.

The right of freely alienating fees was not acquired until the quality of heritability had become definitely attached to them. It was finally established by the famous statute *Quia Emptores* (Stat. Westminster III, 1290), which granted and ordained that from thenceforth "it should be lawful to every freeman to sell at his own pleasure his lands and tenements or part of them," and at the same time provided that the feoffee, or person to whom the lands were conveyed, should hold them not of his seller, but "of the chief lord of the fee, by such service and customs as his feoffor held before." See *FEOFFMENT*; *SUBINFEUDATION*.

A fee with the qualities of general heritability and unlimited alienability is known as a fee simple (*feodum simplex*), and this is the form of estate commonly referred to when the term "fee" is employed without a qualifying adjective. Side by side with the fee simple, however, there has grown up an inferior kind of fee, with limited rights of inheritance and with restricted rights of alienation, known as a fee tail; but this is now, after 600 years of existence, dying out. See *ESTATE*; *FEE SIMPLE*; *FEE TAIL*.

In Scottish law the term "fee" is employed to describe the full right of proprietorship of lands, as contrasted with a life rent, which is the limited right of usufruct during life. A fee farm is land held by another in fee—i.e., in perpetuity by the tenant and his heirs, but subject to a perpetual rent, payable to the lord of whom the land is held. It was a common form of landholding in several of the American Colonies.

Consult the *Commentaries* of Blackstone and Kent; and Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899); Digby, *History of the Law of Real Property* (5th ed., Oxford, 1897); Williams, *Principles of the Law of Real Property* (22d ed., Toronto, 1914).

FEEBLE-MINDED. See *MENTAL DEFECTIVES*.

FEEDING FARM ANIMALS. The proper and economical feeding of farm animals is receiving far more attention and is conducted in a much more intelligent manner than formerly. A generation ago stock was pastured during the summer, no grain was given during that season, and in winter hay and straw were fed with such corn or other grain as the farmer raised. While this practice still prevails over a part of the United States, the soiling system (see *SOILING*) is coming into extensive use, especially in the East, and greater attention is being paid to growing a variety of feeds for stock. Succulent

feeds are now generally advocated for use with the dry feed, and the general adoption of the silo provides these, while furnishing the cheapest feed which can be produced on the average American farm. Roots are used to some extent to furnish succulent food, but their growth has increased but little in extent in the United States, although they are extensively grown for feeding in Great Britain. The increasing supply of by-products from oil and flour mills, starch and glucose factories, breweries, etc., has been accompanied by the extensive employment of these materials to supplement the coarser and less concentrated feeds grown on the farm; and the introduction and cultivation of different kinds of leguminous crops, such as clovers, soy bean, cowpea, alfalfa, etc., has increased the supply of protein, which is the most expensive of the nutrients.

Stock feeding is an art in which experience and judgment are very important elements of success. The aid of science has been invoked, and, as a result of investigations in animal physiology and the chemistry of nutrition, many of the scientific principles underlying the art have been worked out and formulated. These studies have shown that the animal body is composed mainly of four classes of substances—water, ash, fat, and nitrogenous materials—the proportions of each varying with the age of the animal, treatment, purpose for which it is kept, etc. These materials are being constantly broken down or consumed as a result of the life of the animal. To keep the animal in a healthy and vigorous condition there must be a constant supply of new material, i.e., food, and of the kind of food that furnishes the necessary nutrients. If an animal is growing, or producing milk, or performing heavy work, food is required in addition to that needed to supply the natural waste of the body. The principles of feeding animals rest upon replacement of the natural losses of the body and upon supplying the proper materials for making growth, milk, wool, etc. The various materials used as food for animals contain the same four constituents found in the body, viz., water, ash, fat, nitrogenous substances (protein), and in addition carbohydrates (sugar, starch, etc.), and fibre. Regarding their functions, it may be said, first, that food, when assimilated, is in part consumed to yield heat and energy for work and action, and in part stored up in the body for repair of the organs and as additional supply of fat, muscle, and other tissues. The sources of heat in the body and energy for work are supplied mainly by the fat and carbohydrates, and, under some conditions, by the protein. The value of fat as a heat producer is nearly two and a half times that of carbohydrates or protein. The sources of fat in the body are mainly the fat and carbohydrates of the food; the carbohydrates are not incorporated into the body as such, but are changed to fat. The exclusive source of protein, which is the essential constituent of blood, skin, muscle, tendon, nerve, hair, wool, casein of milk, etc., is the protein of the food. Hence the importance of supplying a liberal amount of protein in the food. The excess of protein may be worked over into fat, or it may be consumed by the body to yield body heat and energy for work. The fibre serves the same purpose as the carbohydrates, and the ash is used in the framework—the bones—and is also a constituent of the blood and other components of the body.

The needs of farm animals under different conditions of growth, work, and production have been studied in intricate experiments, and as a result the body requirements, in terms of digestible protein, fat, and carbohydrates, have been largely determined. These requirements have been formulated in the shape of so-called "feeding standards," which, while not absolute and inflexible measures of the body needs, are convenient and helpful indications of the amounts of nutrients required per day. The composition, fuel value, and digestibility of the principal feeding stuffs have been determined and are set forth in tables in convenient form for calculating rations.

Abstract knowledge cannot take the place of experience in stock feeding, but it will prove of great value when combined with experience, enabling more intelligent practice, and giving a deeper insight and a wider range of vision. The agricultural experiment stations have worked out and tested a great variety of rations for different kinds of animals, and, from studies of the rations which were being fed by farmers, have been able to suggest modifications of them which, while more scientific, were also more economical and effective. It is impossible, in the space here available, to give rations or directions for feeding under the varied conditions which prevail in different localities. The kinds of feeding stuffs available and their cost, and the system of farming which is practiced, all have to be taken into account. Since the farmer usually has sufficient carbohydrate materials, he seeks to increase his supply of protein in the concentrated feeds he buys. The tables of composition will assist him in selecting these materials. In addition to the publications of the experiment stations, several excellent books have been written which treat the subject of feeding from both the scientific and the practical side. Consult: Armsby, *Manual of Cattle Feeding* (New York, 1890); Henry, *Feeds and Feeding* (Madison, Wis., 1910); "The Feeding of Farm Animals," in *United States Department of Agriculture, Farmers' Bulletin No. 22* (Washington, 1902); Jordan, *Feeding of Animals* (New York, 1903); Armsby, *The Principles of Animal Nutrition* (ib., 1903); H. P. Smith, *Profitable Stock Feeding* (Lincoln, 1906); O. Kellner, *The Scientific Feeding of Animals*, trans. by W. Goodwin (London, 1909); C. W. Burkett, *First Principles of Feeding Farm Animals* (New York, 1912). See CATTLE; DAIRYING; FEEDING STUFFS; HOGS; SHEEP.

FEEDING STUFFS. A general term applied to all kinds of food materials used for farm animals, including so-called "fodder," "forage," and grain feeds. These materials are very diverse in character. They may be green, wet, or dry; the whole plant, as in the case of hay; only a part, as in the case of root crops; and the seeds of grains, or by-products from various manufactories. They are vegetable for the most part, although ground meat and bone and blood are used to some extent, especially in Europe, and the by-products from the dairy—skim milk, buttermilk, and whey—find extensive use for young animals. The number and variety of feeding stuffs have increased greatly in recent years. Formerly hay, corn fodder, straw, and the cereal grains constituted the main supply, but now the supply of home-grown and commercial feeding stuffs has become exceedingly varied, by the introduction and wide cultivation

of a long list of field crops, such as millets, cowpea, field peas, soy bean, vetch, rape, alfalfa, sorghums, etc.; by the extensive production of brans from the flour mills, oil cakes from linseed and cottonseed-oil mills; and by numerous by-products from the manufacture of sugar, starch, breakfast foods, beer and malt liquors, which are prepared from corn and cereal grains. New kinds appear upon the market annually, and variations in the method of manufacture cause changes in the composition and character of the by-product.

Feeding stuffs may be classified in a general way as (1) coarse fodders, also called "roughage," or "roughness," including hays, straw, corn fodder, silage, and similar coarse materials, and (2) concentrated feeds, often referred to as grain feed or "concentrates," which include such materials as cereal grains, leguminous seeds, and the by-products mentioned above. These classes of feeding stuffs differ widely in composition, i.e., in the proportion in which the various nutrients are present. They all contain the same general groups of substances, viz., water, protein, fats, carbohydrates (starch, sugar, etc.), fibre, and ash. However dry a feeding stuff may be, it always contains a considerable amount of water, which can be driven off by heat. The amount may be only 10 or 15 pounds per 100 pounds of materials, as in the case of dry fodders, but in green fodders and silage it amounts to nearly 80 pounds, and in some root crops to 90 pounds per hundred. The rest of the material, which contains the nutrients, is dry matter, and since the water varies so widely feeding stuffs are often compared on the dry-matter basis. Protein is the name of a group of materials containing nitrogen; all other constituents are nonnitrogenous or nitrogen free. Albuminoids, the casein of milk, and lean meat are examples of protein. They are the "flesh formers" of the food. The fat includes, besides the real fats, wax, the green coloring matter of plants, and other materials extractable by ether; hence it is usually designated as crude fat. The carbohydrates likewise include a variety of materials, and from the manner of their determination are usually designated in analyses as "nitrogen-free extract." The fibre or cellulose is also of this class, but, as it is determined separately, is usually so stated. The ash is the incombustible part of the fodder—the part left when it is burned. It consists chiefly of lime, magnesia, potash, soda, iron, and phosphates, and is used largely in forming bone. These constituents, except the water, are called "nutrients," as they are the materials which nourish the body.

The protein is the most expensive nutrient, and the percentage of it largely determines the value of the more concentrated feeding stuffs. Another factor which influences the comparative value of feeding stuffs is the digestibility, or the proportions of the several nutrients which are digested by the animal. The digestibility varies widely in the case of different materials. In the case of corn meal, e.g., 68 per cent of the protein, 95 per cent of the nitrogen-free extract, and 92 per cent of the fat are digested, on an average; while in the case of wheat straw only about 23 per cent of the protein, 50 per cent of the nitrogen-free extract, and 35 per cent of the fat are digested. The undigested portions are of no use in the nutrition of the animal and are voided as manure. Tables of digestibility have been

worked out, covering the more important feeds in general use. For these and further analyses of feeding stuffs, the reader is referred to compilations published by the United States Department of Agriculture.

The composition of feeding stuffs, or the proportion in which these nutrients are present, is determined by chemical analysis. A very large number of analyses of American feeding stuffs have been made, and while they show that the same kind of material varies in composition, depending upon the season, the stage of growth and other factors, the following table will serve to show the average composition of a number of the more important kinds:

of protein, fat, etc., in their products, and which shall provide a feeding-stuff control, similar to that for fertilizers. Such laws have been passed in the New England and Central States and are rapidly spreading. They have afforded protection in the purchase of these materials. Similar protection is provided by the Fertilizer and Feeding Stuff Act of England and by a voluntary control in Germany. From time to time various mixed or "condimental" feeds are extensively advertised, with extravagant claims for their effect on the general health of animals or for their ability to increase milk production greatly. Tonic or medicinal properties are claimed for many of them. They often contain a consider-

AVERAGE COMPOSITION OF FEEDING STUFFS

The large demand for the more concentrated feeds, especially the by-products, has led to adulteration with cheaper and inferior materials to some extent and to the use of names which may deceive the purchaser. Cottonseed meal, e.g., has been diluted with a quantity of ground cottonseed hulls and sold under the name of cottonseed feed, the mixture being greatly inferior to the meal. Furthermore, the by-products vary widely in composition, due to changes in the process of manufacture or to the separation of the germs from the rest, or to the addition of the hulls. These facts have suggested the desirability of legislation which shall require manufacturers to guarantee the percentage

able quantity of salt, and frequently a harmless quantity of fenugreek (q.v.), sulphur, gentian, ginger, and similar substances. None of them are concentrated feeds, in the common acceptance of the term; and Sir John Lawes many years ago showed condimental feeds to be of no advantage to healthy stock. They are usually sold in small packages, the price ranging from 10 to 20 cents a pound, which, from the standpoint of their feeding value, is exorbitant. In spite of this large quantities of these feeds are sold throughout the United States.

A new class of feeding stuffs has recently come into use in Europe and America, in which the molasses from sugar-beet factories is a promi-

nent component. Various materials, such as palm-nut meal, bran, ground cornstalks, peat, and dried beet chips are used to absorb the molasses. Some of these molasses feeds have given surprisingly good results, and they appear to be relished by stock. Blood has been used to some extent in a similar way. See FEEDING FARM ANIMALS.

FEELHAN, PATRICK AUGUSTINE A. (1829-1902). An American Roman Catholic archbishop. He was born in Tipperary, Ireland, and was educated at Maynooth College, Kildare. He came to the United States in 1852, settled in St. Louis, Mo., and became pastor of St. John's Church in that city. In 1854 he was appointed president of the Seminary of Carondelet and in 1859 pastor of the Church of the Immaculate Conception. He was consecrated Bishop of Nashville, where he showed his great ability as an organizer in completely reconstructing the diocese, which had become demoralized during the Civil War. With great obstacles to overcome, and with his work made more difficult by three successive epidemics of yellow fever, he made his diocese administratively one of the strongest in the country, and its educational institutions models for parochial schools in other dioceses. He founded the Catholic Knights of America, a lay organization which spread throughout the United States. In 1880 Bishop Feehan was installed as the first Archbishop of the newly created archiepiscopal see of Chicago.

FEELING (AS. *fēlan*, OHG. *fuolen*, Ger. *fühlen*, to feel; ultimately connected with Lat. *pālma*, Gk. *παλάμη*, *palamē*, palm of the hand, Skt. *pāṇi*, hand, AS., OS. *folm*, hand). A term whose variety of meaning has caused much confusion in psychology. It is used (1) for perceptions of touch: we say that a thing "feels" hard or soft or rough; and we "feel" for our matches in the dark or (metaphorically) "feel" our way in some delicate undertaking. This, the popular usage, would seem to be etymologically correct. It is, however, being discontinued in psychology. (2) The word is used for certain organic sensations of diffuse character, which are ordinarily tinged with strong affection: we speak of "feeling" hungry, thirsty, fatigued, etc. This usage approximates very closely to (6) below. (3) As touch is the primordial sense, from which all others have been developed, it is but natural that the term "feeling," the perception of touch, should be extended to embrace every mode of mental process. Feeling, in this sense, covers all sorts of mental elements and formations: sensations, affections, perceptions, ideas, emotions, actions, etc. It is being replaced by "mental process" (q.v.).

In modern psychology there is a well-marked tendency to restrict the term "feeling," to some kind of affective process. (See AFFECTION.) So we find (4) a classification of mental functions as those of the intellect, the feelings or sensibilities, and the will: feeling here including emotions, sentiments, moods, and feelings proper. We often say, too, that we "feel" sorry or glad or depressed; or that we "feel" the beauty of a landscape or the sublimity of a work of art. (5) Since this usage is unnecessarily wide, we find the meaning of the term restricted. Some authors make "feeling" the equivalent of the German *reines Gefühl*, or pure feeling, i.e., define it as affection is defined. (6) It is, however, better to regard feeling as a concrete process, compounded of

sensation and affection, and lying in order of complexity next below the emotion (q.v.). It would then be correct to talk of the "feeling" of drowsiness or suffocation or ill health, since in all such cases we have a complex of sensations (for the most part organic) dominated by a pleasantness or unpleasantness. It would, again, be correct to speak of "feeling" hungry or thirsty or tired (see (2) above), provided that we had in mind the total consciousness of affectively toned organic sensations and not merely the sensations as such. Consult: James, *Principles of Psychology* (New York, 1890); Wundt, *Outlines of Psychology*, trans. by Judd (Leipzig, 1902); Titchener, *Text-Book of Psychology* (New York, 1910); Kuelpe, *Outlines of Psychology*, trans. by Titchener (London, 1909).

FEEN, DIE. The first opera of Wagner (q.v.), first produced at Munich, June 28, 1888.

FEER-HERZOG, fār'hértzog, KARL (1820-80). A Swiss statesman and political economist, born at Rixheim, Alsace. After 1852 he was a member of the Grand Council, of which he was twice elected president. From 1865 until his death he represented Switzerland in the Latin Monetary Union and in this capacity was an advocate of the gold standard. In 1867 he was director of the Swiss section of the Paris Exposition, and for more than 16 years he was president of the Financial Commission of Switzerland. His principal works are: *L'Unification monétaire internationale* (1869); *La France et ses alliés monétaires en présence de l'Unification universelle des monnaies* (1873); *Gold oder Silber?* (1874).

FEES. The compensation of lawyers, physicians, and certain public officials for their professional or official services. In England neither barristers nor physicians could recover their fees by legal proceedings against their clients or patients, except under a special contract. The ground of this rule was that such fees are regarded not as payment, but as an expression of gratitude for services the value of which cannot be expressed in money. The origin of the rule in the case of the advocates is traced to the relation which subsisted between the patron (*patronus*) and his client in ancient Rome. When the former appeared as the defender of the latter, he practiced, as Blackstone says (iii, 29), *gratis*, for honor merely, or at the most for the sake of gaining influence; and so, likewise, it is established in England that a counsel can maintain no action for his fees, which are given, not as *locatio vel conductio*, but as *quiddam honorarium*; not as a salary or hire, but as a mere gratuity, which a counselor cannot demand without doing wrong to his reputation. The rule at Rome was maintained even under the Emperors, and Tacitus mentions (*Ann.*, lib. ii, c. 5) that it was directed by a decree of the Senate that these *honoraria* should not in any case exceed 10,000 sesterces, or about \$400. It has further been decided in England that no action lies to recover back a fee given to a barrister to argue a cause which he did not attend. But special pleaders, equity draftsmen, and conveyancers, who have taken out certificates to practice under the bar, and are not rated as counsel, may recover their reasonable charges for business done by them. As regards physicians, the rule that a fee could not be recovered by an action at law was applied in the case of *Chorley v. Bolcot*, in 1791 (4 T. R. 317). If, however, either a barrister

or a physician acted under a special agreement or promise of a certain payment, then an action might be brought for the money. But all medical practitioners were relieved from the above code of honor by the Act of 21 and 22 Vict. c. 90, which applied to the United Kingdom and enabled them to recover in any court of law their reasonable charges as well as costs of medicines and medical appliances used. This rule applies to physicians, surgeons, and apothecaries as defined by the statute. Members of the inferior branches of both professions—attorneys, solicitors, etc., on the one hand, and surgeons, dentists, cuppers, and the like on the other—were always entitled to maintain an action for their fees. In Scotland the same rules prevail as in England with reference to both professions. In France, though the delicate sense of honor of the bar has always been preserved with quite as much care as in England, the rule is somewhat different. In law an action for the recovery of fees would be maintainable in that country by an advocate; but "in Paris the rule of the ancient bar, founded on the disinterestedness which was its characteristic and according to which any judicial demand of payment of fees was strictly forbidden under pain of erasure from the table [of advocates], has been religiously preserved." There is no law in the United States which puts contracts for services by lawyers or physicians on any different basis from contracts made by other persons. In most of the American States an attorney at law has a lien on the cause of action and on the papers in his hands for the costs of the suit, including his fees. (See ATTORNEY; BARRISTER; COSTS.) The practice of compensating sheriffs, jail keepers, and certain other officials by fees, which formerly prevailed generally in the United States, has fallen into disrepute and has been almost everywhere abandoned.

FEE SIMPLE (Lat. *feodum simplex*). A fee, or estate of inheritance, which has the qualities of general heritability and unlimited alienability. It is distinguished from the fee tail. See **FEE TAIL**.

A fee simple may be *absolute*, in which case it is unhampered by any condition or limitation whatsoever; or it may be *qualified*, or *limited*, as where it is to come to an end upon the happening of a definite event. The *conditional fee* of the early common law, out of which the fee tail has been developed, was a variety of the qualified or limited fee simple. It was a gift of lands to a man and his heirs, provided and so long as he should have heirs of his body. (See **CONDITIONAL FEE**; **DONIS CONDITIONALIBUS**, **STATUTE DE.**) Of this nature is a conveyance to A and his heirs so long as St. Paul's Church shall stand, or so long as the Republic shall endure, or until a certain charity shall be established.

But, though a fee simple may be made terminable by a limitation, as above described, it is not possible to deprive it of either of its principal incidents of alienability and heritability. No restriction upon either of these is valid, and a condition providing for a forfeiture on alienation or limiting the course of descent, will be wholly disregarded. The same is true of the only surviving feudal incident attaching to fees simple—that of escheat. This will take effect on failure of heirs, irrespective of any attempt to qualify or prevent it. Thus, a gift of lands to A and his heirs, with the proviso that on

failure of heirs the property shall go to B, will vest an absolute fee simple in A, subject to the right of escheat, and the attempted gift to B will fail. See **ESCHEAT**; **ESTATE**.

As a fee simple is the largest estate that a man can have, falling short of absolute ownership only through the operation of the doctrine of tenure, and subject only to the dominant rights of the lord (usually the state) of whom the land is held, it was not possible at common law to grant any remainder or other future estate over after a fee simple. Under modern statutes, however, a fee simple terminable by a conditional event may be followed by another fee simple. See **EXCECUTORY DEVISE**. Consult the authorities referred to under **FEE**.

FEE TAIL (ML. *feodum talliatum*, abbreviated fee). A fee, or estate of inheritance, in which the inheritance is restricted to the lineal descendants of the tenant. The right of inheritance, which is the principal characteristic of a fee, is not ordinarily capable of restriction, but the fee tail was devised for the express purpose of permitting such a restriction in a limited class of cases. Its object was to tie up estates and keep them in the family of the donor, and it achieved this end by giving effect to a conditional gift of lands to a person and the heirs of his body. This was originally known as a fee simple conditional and was construed to vest in the donee a conditional estate, which became absolutely subject to his disposition on birth of issue. As such power of disposition was inconsistent with the purposes of the gift, the celebrated statute *De Donis Conditionalibus* (Concerning Conditional Gifts) was passed in 1285 (stat. Westminster II) to restrict the power of the donee of such an estate and to protect the interests of the issue and of the persons to whom the estate was to go upon failure of issue. This it did by forbidding the alienation of the property by the tenant in tail.

For nearly 200 years after the passing of this act land settled in the form which it prescribed continued to be held under the fetters of a strict entail. But the tendency of the law, which in Scotland was to strengthen the power of entail, was in England in the opposite direction. For a long time tenants in tail, taking advantage of legal technicalities, were able practically to defeat the limitation in tail by means of a discontinuance. But it was not till the time of Edward IV that an effectual means of evading the provisions of the act was brought into use; this was achieved by means of a process called a *common recovery* (q.v.). By this process a tenant in tail could bar the entail and convert the estate into a fee simple. Another mode of barring an entail was by means of a *fine* (q.v.). It had been declared by the statute *De Donis* that levying a fine of lands should be no bar to the entail; but by 32 Hen. VIII, c. 36, it was enacted that a fine of lands, when duly levied, should be a complete bar to the tenant in tail and those claiming under him. It is to be observed that the operation of a fine was confined to those claiming under the tenant in tail; those who had rights of reversion or remainder under the grantor of the entail were not excluded by this species of assurance; so that by means of a recovery only could an estate tail be converted into a fee simple. From the introduction of common recoveries till the passing of the Fines and Recoveries Act (3 and 4 Wm. IV, c. 74), a period of more than 300

years, it was impossible that an estate could be held under the fetters of an entail if the tenant in tail and the next heir chose to combine to defeat the entail. By the Fines and Recoveries Act the technicalities formerly necessary in order to bar an entail were removed, and a tenant in tail may now by a simple conveyance alienate his estate at pleasure.

Estates tail are classified according to the form of the gift. If the limitation be to the heirs of the body of the tenant in tail without special qualification, it is a *fee tail general*; if it be to the heirs of the body of the tenant and his wife Joan, it is a *fee tail special*; if it be to the male heirs of the body, it is a *fee tail male*. So there may be fees tail special male, fees tail special female, etc. But the limitation must always be to the issue of the tenant in tail. As a fee tail is an abbreviated fee—a less estate, i.e., than a fee simple—it is, unlike the fee simple, capable of supporting a future estate by way of remainder or reversion. Thus, it is possible, even at common law, to make a conveyance of lands to A and the heirs of his body, with remainder, on failure of such heirs, to B.

Prior to the Revolution the English law of entails prevailed in the British Colonies in America. But, though it still exists in a few States, it has generally been abolished in the United States by statute—in Virginia as early as 1776 and in New York in 1782. In most States it is provided that an attempt to create a fee tail shall result in a fee simple. Consult the authorities cited under FEE.

FEHLING, fä'ling, **HERMANN** (1811–85). A German chemist. He was born at Lübeck and was educated at Heidelberg. After being associated with the Liebig Laboratory at Giessen and studying for a time with Dumas at Paris, he was from 1839 to 1885 professor of chemistry at the Polytechnic Institute, Stuttgart. His most noteworthy researches were in the departments of analytical and industrial chemistry, his process for measuring the amount of glucose in substances being especially well known. (See **FEHLING'S SOLUTION**.) He edited and published the new edition of the *Handwörterbuch der Chemie* by Liebig, Poggendorff, and Wöhler (1871 et seq.), and translated Payen's *Précis de chimie industrielle* into German (2d ed., 1852).

FEHLING'S SOLUTION (named from Hermann Fehling, who first introduced the solution into analytical practice). A deep-blue alkaline solution of cupric oxide used to detect the presence and determine the amount of sugar in a given mixture. The solution is best prepared, according to Soxhlet, by adding 34.6 grams of copper sulphate made up with water to 500 cubic centimeters, to a mixture of 60 grams of caustic soda and 173 grams of Rochelle salt (sodium-potassium tartrate) likewise made up to 500 cubic centimeters with water. It is still better to keep the two solutions in separate vessels and prepare Fehling's solution proper by mixing equal volumes of the two just before using, as Fehling's solution is liable to undergo decomposition. The simpler varieties of sugar reduce the cupric oxide (CuO) contained in this solution to cuprous oxide (Cu₂O), which is insoluble and has a bright-red color. Thus, one-half gram of dextrose added to 100 cubic centimeters of Fehling's solution prepared as described above would, on gentle warming, completely destroy the blue color of the solution and cause copper to precipitate in the form of

cuprous oxide. Conversely, therefore, if a mixture is submitted to a chemist for examination and he is called upon to determine the amount of dextrose present in it, all he has to do is to determine carefully the volume of Fehling's solution that may be completely decolorized by the given mixture.

Ordinary cane sugar has no direct action on Fehling's solution. By fermentation, however, or by the action of dilute acids, it may be "inverted," i.e., split up into simpler varieties of sugar; and then, of course, it becomes capable of reducing Fehling's solution. Similarly Fehling's solution is not reduced by cellulose; but cellulose may be hydrolyzed by acids, and the resulting simple sugar will again reduce Fehling's solution. Among the disaccharides which, unlike cane sugar, do reduce Fehling's solution are maltose (malt sugar) and lactose (milk sugar). See CARBOHYDRATES.

FEHMARN, fä'märn, or **FEMERN**, fä'märn. An island in the Baltic Sea, belonging to the German Province of Schleswig-Holstein, separated from Holstein by a strait called the Fehmarn Sound, and from Laaland on the north by Fehmarn Belt (Map: Germany, D 1). It has an area of 71 square miles. The surface of the island is flat and but sparsely wooded; the soil is fruitful. Agriculture, stock raising, fisheries, and the making of stockings for exportation form the principal employments of the inhabitants. Fehmarn has a population of about 10,000. Its harbors are very shallow and can be navigated only by vessels of light draft. The chief towns are Burg, the capital, and Petersdorf. The island was transferred from Denmark to Prussia in 1866.

FEHMGERICHTE, fäm'ge-rîk'te. See **VEHMGERICHTE**.

FEHMIC (fä'mîk) **COURTS**. See **VEHMGERICHTE**.

FEIA, fä'yä. A lake of Brazil, in the state of Rio de Janeiro, about 12 miles south of Campos, a short distance from the coast. It covers an area of about 190 square miles, but is very shallow; its waters teem with fish. It is connected by a canal with the Atlantic on the east and is in water communication with the Parahyba River on the north.

FEIJÓ, or **FEIJÓO**, fä-zhó', **DIEGO ANTONIO** (1784–1843). A Brazilian statesman. He was born at São Paulo, took holy orders in 1807, and was a priest in Parahyba, Campinas, and Itá. In 1822 he was appointed deputy to the Cortes at Lisbon, but resigned from that body with four other Brazilian deputies upon the declaration of Brazilian independence. As deputy and representative of the Liberal party (1823–33) he presented the bills proposing the reform of the municipalities and advocating the abolition of clerical celibacy, which he declared to be anti-social and antireligious. On July 4, 1831, he was appointed Minister of Justice and served until July 20, 1832. He was regent during the minority of Pedro II, from Oct. 12, 1835, to Sept. 18, 1837, during which time his liberal policy was bitterly attacked by the Conservatives. Because of this opposition he finally resigned. Later he was persecuted and exiled.

FEIJÓO Y MONTENEGRO, **BENITO JERÓNIMO**. See **FEYJÓO Y MONTENEGRO**, **BENITO JERÓNIMO**.

FEILDEN, feld'en, **HENRY WEMYSS** (1838–). An English naturalist and explorer.

He was educated at Cheltenham College and served in the British army in the Indian Mutiny and in 1860 in China. In 1862-65 he was assistant adjutant general in the American Confederate army, serving until the very end of the war in the Army of the Tennessee. In 1875-76 he was naturalist to the British polar expedition led by Nares and made valuable studies in Greenland, where a peninsula is named in his honor. He fought in the Boer wars of 1881 and 1899-1902 and in 1900 was made Companion of the Bath.

FEILDING, feld'ing, ROBERT (*Beau Feilding*) (c.1651-1712). An English courtier. He commanded a regiment under James II, was a member of the Irish Parliament of 1689, was pardoned by William III in 1696, but upon his return to England passed a season in Newgate jail. He was convicted of bigamy in 1706, one of his wives being the Duchess of Cleveland. Swift, in "Mean and Great Figures" (*Works*, 1814), has intense scorn for him, and Steele described him in two *Tatler* papers (Nos. 50, 51, Aug. 4 and 6, 1709) as "Orlando the Fair." Lely painted a portrait of a "handsome Feilding."

FEINT, fänt (Fr. *feinte*, sham, from *feindre*, to feign, from Lat. *finger*, to fashion, Gk. *θρυγαν*, *thinganēn*, to touch, Goth. *deigan*, to knead, Skt. *dih*, to smear). A military strategic or tactical device, designed usually to deceive an enemy or to cover a real design or purpose. See ATTACK; TACTICS, MILITARY; DEMONSTRATION; BATTLE; STRATEGY.

FEIS-CEOIL, fäsh'k'-yöl' (Ir., assembly for music, from *feis*, assembly, and *ceoil*, gen. sing. of *ceol*, music). An Irish musical society founded at Dublin in 1807 for the advancement of music and for the purpose of giving a stimulus to musical studies in that country. It has an annual session at which prizes are distributed among the successful competitors. There are separate competitions for bands, choirs, vocal and instrumental soloists, and original compositions. It is specially designed to encourage native talent and is a very successful institution.

FEISI, fä'sä, or **FEIYASI**, ABUL FEIS INN MUBARAK (1547-95). A celebrated Indo-Persian poet and scholar, born in Agra. In 1572 he received an appointment as court poet to the Emperor Akbar. He wrote many lyrics, some epics (mostly unfinished), a commentary on the *Koran*, and translations from Sanskrit into Persian of the *Mahabharata* and *Lilivati* as well as various mathematical and philosophical works. His Persian version of the well-known episode of Nala and Damayanti from the *Bharata* under the title *Nal u Damayanti* is especially worthy of mention. In Max Müller's *Introduction to the Science of Religion* (New York, 1870) there are a number of metrical paraphrases of the poems of Feisi.

FEITH, fit, REIJNVIS (1753-1824). A Dutch poet, dramatist, and romancer, of melancholy humor. He was born at Zwolle, where, after graduation at Leyden (1770), he became burgo-master in 1780 and published in 1783 the novel *Julia*, the Dutch *Werther*, steeped in romantic gloom. This he followed by tragedies, *Thirsa* (1784) and *The Patriots* (1785), and another *Werther* novel, *Ferdinand en Constantia* (1785), which made him the most popular poet of Holland, but provoked bitter criticism for their morbid sentimentality. He published a third tragedy, *Lady Jane Grey* (1791), and *The Grave*

(1792), a didactic poem. Other tragedies and a didactic poem in six cantos on *Old Age* (1802), with five volumes of miscellaneous poems (1796-1814), and *Poems for Public Worship* (1804), complete his works, of which an edition (13 vols.) appeared in 1825.

FEJER, fé'yär, György (1766-1851). A Hungarian author. He was born at Keszthely (Zala), and was educated at Pest and Pressburg. In 1808 he became professor, and in 1824 librarian, at the University of Pest. There he devoted the greater part of his life to the preparation of the *Codex Diplomaticus Hungariae* (45 vols., 1820-44), which consists of documents relating to the history of Hungary from 104 to 1440 A.D. He wrote important historical and political works in his native language, one of which, on *Political Revolutions* (1850), was suppressed by the Austrian government.

FEJÉRVÁRY DE KOMLÓS-KERESZTES, fé'yär-vá'ri de kóm'lósh-kér'és-tész, Géza, BARON (1833-). A Hungarian statesman and general, born at Josefstadt. For his services at Solferino he was ennobled, in 1865 he was appointed major and aid-de-camp to the Emperor, and soon afterward he became secretary in the Ministry of National Defense. In 1883 he was advanced to the rank of lieutenant field marshal, then succeeding Raday as Hungarian Minister of National Defense, a post which he held under various premiers till 1903. He was an officer in the royal bodyguard in June, 1905, when he was made head of an extraparlimentary ministry to cope with the difficult situation created by the defeat of the Liberal Tisza cabinet and the refusal of the Coalition Opposition to take office. His ministry dissolved the Chamber and occupied the buildings of Parliament with soldiers. The Coalition then yielded, Fejérváry in April, 1906, resigned, and Wekerle formed a Coalition cabinet. See HUNGARY, History, and consult the sketch by Szalay (Pressburg, 1901).

FELANITX, fä'lä-néch', or **FELANICHE** (ancient *Canati*). A town on the island of Majorca (q.v.) in the Province of Baleares, Spain (Map: Spain, G 3). It is situated in a valley surrounded by mountains and is well built, with a number of squares, one of which has a fountain. The municipal building and the parish church of San Miguel are among the more pretentious structures. On a neighboring hill is an old Moorish castle with subterranean vaults. Felanitx has some trade in agricultural products and wine and manufactures liquors, pottery, cloth, soap, lime, etc. Stock raising and fishing also are carried on. Puerto Colom, its port, has a safe but shallow harbor. Pop., 1900, 11,558; 1910, 11,223.

FELCH, ALFHEUS (1806-96). An American jurist, born in Maryland. He graduated at Bowdoin College in 1827 and removed to Michigan, where he served in the State Legislature in 1836-37, and in 1838-39 was one of the State Bank Commissioners, in which capacity he exposed many frauds under the banking law. He was judge of the Supreme Court of the State in 1842-45, and Governor in 1846-47; but before the expiration of his term he resigned to enter the Senate of the United States, in which he served six years (1847-53). He was then made president of the commission appointed to adjust the Spanish and Mexican land claims growing out of the provisions of the Treaty of Guada-

lupe-Hidalgo, and from 1879 to 1883 was professor of law in the University of Michigan.

FELDER, CAJETAN, BARON (1814-94). An Austrian politician. He was born and educated at Vienna and in 1841 became lecturer on political history, statistics, and international law at the university there. As burgomaster of the city (1868-78), he introduced numerous reforms. In 1869 he became a member of the Upper House, and in 1878-84 was marshal of Lower Austria. He wrote *Die Gemeindeverwaltung der Reichshaupt- und Residenzstadt Wien* (2d ed., 1872; 2 additional vols., 1875-78), and some papers on entomology, especially the section on lepidoptera in *Reise der Fregatte Novara um die Erde* (1864-75).

FELDKIRCH, fēl'tkīrk. A town of Vorarlberg, Austria, picturesquely situated about 1500 feet above sea level, in a rocky pass, which forms a natural fortress of great strength commanding the Vorarlberg pass, on the river Ill, near its junction with the Rhine (Map: Austria, A 3). It is 23 miles west-southwest of Bregenz. There are a handsome Rathaus, a Jesuit training college (Stella Matutina), a gymnasium, and a teachers' seminary. The town's industries include flour, woolen, and saw mills, dye works, and a bell foundry. Above Feldkirch rises the ruined castle of Schattensburg, once the seat of the counts of Montfort. Pop., 1900, 4617; 1910, 5057.

FELDSPAR, fēl'spār (Ger. *Feldspath*, from *Feld*, field + *Spath*, MHG. *spāt*, laminated stone; connected by popular etymology with *spar*). A group of minerals, all the species of which consist of silicate of aluminium in combination with one or more of the following metals: sodium, potassium, calcium, or barium. For many reasons the feldspars are considered the most important group of minerals in the large division of the silicates. The various species and their numerous varieties, all of which occur originally in igneous or metamorphic rocks, form an essential constituent of a number of rocks such as granite, syenite, gneiss, etc., which are of primary importance as building materials and are largely quarried in all parts of the world. As a group of minerals, the feldspars are in general characterized by a close agreement in crystal habit, prism angle, and methods of twinning, and especially by two easy cleavages inclined to one another at an angle close to 90°, the cleavage surfaces being smooth and of high polish. Their hardness is not quite that of quartz, and their specific gravity varies between 2.5 and 2.9, while their colors range from white, through pink, yellow, green, and red, to dark greenish brown. According to their crystalline form the different varieties are divided into monoclinic and triclinic feldspar, and under each of these heads they are grouped into species, according to their composition. *Orthoclase*, a potash feldspar, is a very common kind, occurring in monoclinic crystals of glassy, white, pink, and flesh-red color, in granite, gneiss, syenite, and many volcanic rocks. *Adularia*, or moonstone, is a white variety of orthoclase that, because of its pearly, opalescent reflections, is cut as a gem. *Microcline*, a triclinic potash feldspar, is the most common species of the group, being largely present in pegmatite veins. It has a green variety, amazon stone, found in granite at Pike's Peak, Colo., and in the Ural Mountains; this variety is also cut as a gem stone.

The plagioclase feldspars, embracing albite, oligoclase, andesine, labradorite, anorthite, and their several varieties, are soda-lime feldspars that vary in composition between the *albite*, which is high in soda and low in lime, and *anorthite*, which is low in soda and high in lime. Among the members of this group labradorite is the most important, as it forms a large part of the volcanic rocks of Pre-Cambrian age, such as those in the Adirondack region of New York and in many other similar localities of America and Europe. Some varieties of labradorite exhibit on the polished surface a beautiful play of iridescent colors and have on this account been employed to a considerable extent as ornamental stones.

All the feldspars weather readily under the action of both atmospheric agencies and acidulated surface waters and yield a form of clay known as kaolin, which is of great economic importance in the pottery industries. Unaltered feldspar, especially such as occurs in veins in granite and gneiss, is quarried, crushed, washed, and made into a paste that is applied to the surface of pottery to form the glaze. See **KAOLIN**; **PORCELAIN**; **POTTERY**; and the names of the different forms of feldspar mentioned above.

FÉLEGYHÁZA, fá'légsh-há'sá, or **KISKUN-FÉLEGYHÁZA, kish'koon**. A town in Hungary, about 65 miles southeast of Budapest (Map: Hungary, F 3). It manufactures bricks and cereals and trades in fruit, grain, wine, and tobacco. The surrounding country furnishes rich pastures, and cattle raising is an important industry. Its educational institutions include a trade school, a teachers' institute, and a gymnasium. Pop., 1900, 33,408; 1910, 34,924.

FÉLIBIEN, fá'lé'byün', ANDRÉ (1619-95). A French architect and historiographer. He was born at Chartres and was a protégé of Fouquet and Colbert. He became historiographer of buildings (1666), secretary of the Academy of Architecture (1671), and director of the Cabinet of Antiques (1673). He wrote a great number of works on architecture, painting, and sculpture, which, apart from their historical value, faithfully reflect the opinions of the Royal Academy, of which he was long the recognized exponent. Of these the following are the more important: *Origine de la peinture* (1660); *Entretiens sur les vies et sur les ouvrages des plus excellents peintres, anciens et modernes* (3 parts, 1666-1688); *Conférences de l'Académie de peinture* (1669); *Principes de l'architecture, de la sculpture, de la peinture, etc., avec un dictionnaire des termes propres* (1676-90).

FÉLIBRES, fá'lé'br', LES. See **FÉLIBRIGE**.

FÉLIBRIGE, fá'lé'brézsh'. An association founded at the Château of Fontségugne, near Avignon, on May 21, 1854, and organized in its present form at Avignon on May 21, 1876. Its purpose is stated in the first article of its constitution: "to bring together and to encourage those who by their writings preserve the language of the land of Oc, and also those scholars and artists who study and work in the interest of this region." The *langue d'oc*, so called because of the word for "yes" (*oc*), has never ceased to be spoken in a multitude of dialects all over the south of France, as it still is by some ten millions of persons. No literature of any real value or importance was written in Provençal from the middle of the fourteenth cen-

tury to the beginning of the nineteenth, but the language never entirely died out as a written language. Joseph Roumanille (q.v.), born in 1818, at Saint-Remy near Avignon, first conceived the idea of purifying and perfecting the dialect of his own region. Surrounding himself with a few enthusiastic friends, he strove to systematize its grammar and orthography and, above all, to produce works of genuine poetic value that should speak to the hearts and souls of the humbler classes in the lower Rhone valley as no poems in French could ever do. He himself wrote several volumes of verse and in 1852 edited a collection of Provençal poems by various authors, called *Li Prouvençalo*.

These works form the starting point of a remarkable linguistic and literary revival, which, owing to the national exuberance of the southern French temperament, has not lost its impetus and still embodies the purest and noblest ideal of the race. The names of the seven poets who met at Fontségugne are Joseph Roumanille, Frédéric Mistral, Théodore Aubanel, Eugène Garcin, Anselme Mathieu, Paul Giéra, and Alphonse Tavan.

The word "Félibre" was furnished by Mistral (q.v.), who had found it in an old canticle, wherein Jesus is referred to as disputing with the seven *Félibres* of the law.

Besides the task of pruning and purifying the dialect, the Félibres had to create a public for their works. To this end they set about publishing an annual called the *Armana Prouvençau*, which began with an edition of a few hundred copies and has now reached a circulation of many thousands. In 1859 Mistral published his first long narrative poem, "Mirèio" ("Mireille"), which met with very great success, being praised in the most glowing terms by Lamartine, so that the Provençal Renaissance became known to the literary circles of Paris and soon to the world in general. From this time on the output of verse in Provençal steadily increased; scores, nay, hundreds of writers appeared, and to-day the bibliography of the Félibrean literature fills a large volume.

The movement speedily found adherents, not only in southern France, but even in Spain, where the Catalan poets established Floral Games in 1859 and were soon recognized as brothers by the Félibres. In 1867 the distinguished Catalan poet and patriot Victor Balaguer was received with enthusiasm at Avignon and elsewhere and on his return home sent the Félibres a silver cup, which has become the sacred emblem of the association. In the same spirit of Latin fraternity, the Félibres sent a delegation to take part in the Dante celebration at Florence (1890).

In 1876 the formal organization was effected. There is a consistory of 50 members, called Majoraux, which elects its own members; the consistory is presided over by the Capoulié. All the Félibres are divided into the four *Maintenances* of Provence, Languedoc, Aquitaine, and the Spanish Province of Catalonia. Any seven Félibres dwelling in one locality may ask the *Maintenance* to form them into a *School*. Every seven years floral games are held, when a poet is crowned laureate. He chooses the queen of the Félibrige, who is the living symbol of beauty for the Félibres, as was the lady of his choice for the troubadour in the days of courtly love.

The Capouliés have been: Mistral from 1876 to 1884, Joseph Roumanille from 1884 to 1891,

Félix Gras from 1891 to 1901, and Pierre Devoluy.

The language used by Mistral and the Félibres is based upon the dialect of Saint-Remy. It is not the language of the troubadours any more than an Italian dialect spoken to-day in Lombardy is the language of Dante, though it belongs, of course, to the same general family. Furthermore, six centuries have elapsed since the days of the old poets, bringing great changes in the speech of the people. Mistral deliberately set to work to purify his dialect, casting out forms due to the influence of French, and to render the rustic speech of his home capable of literary expression. The result is a language exceedingly rich in vocabulary, full of terms expressive of what is exclusively Provençal. It is, however, an artificial, literary language that does not represent exactly the speech of any one, although readily understood by nearly all the inhabitants of the region. As the movement progressed, more and more writers claimed the privilege of writing in their own unaltered dialects. The Félibres of the *Limousin* advocate the general use of their dialect, because theirs is the original language of the ancient troubadours, while others claim that theirs is the most centrally located, since it is spoken around Montpellier in the heart of that district. Mistral, the greatest Provençal poet, favored the dialect used east of the Rhone.

But the language of the Félibres tends to prevail because of the sheer superiority of their literature. They count among their number one poet of very high rank, who has revealed the wonders and beauty of the land, the charm of its legends and history, the traits of its people, in verse of great originality and exquisite literary finish. Aubanel and Roumanille were real poets; Félix Gras wrote a number of long, ambitious poems, but succeeded best in the historical romance, and is possibly the best prose writer among the Félibres. Song writers and story-tellers abound. An astonishing number of magazines and periodicals bear witness to the ceaseless activity of these enthusiastic writers. One of its plays, *Lou pan dou peccat*, by Théodore Aubanel (1829-86), was deemed worthy of being translated and produced at the Théâtre Libre under the direction of the famous Antoine (1878); and Daudet, that brilliant son and interpreter of southern France (though living in Paris), translated into Provençal his *Lettres de mon moulin*.

This modern literature in no way continues the literature of the troubadours. Mistral's first inspiration lay in his love of Homer and Vergil; he and his fellow poets were long indifferent to the troubadours, and even while extolling the glories of the past they have written for the Provence of to-day. Mistral at least succeeded in combining this modernism and localism with classic beauty of form, and it would be difficult to find an instance of a more thoroughly original and independent creation in the history of letters.

The only adequate history of the Félibrige is that of G. Jourdanne (Avignon, 1897). Mistral published a large dictionary, *Trésor dou Félibrige* (Aix, 1879-86); and there is a *Grammaire historique de la langue des Félibres* by Koschwitz (Griefswald, 1894). Consult also: Koschwitz, *Ueber die provenzalischen Félibre* (Berlin, 1894); H. Oddo, *La Provence, usages, coutumes, idiomes, depuis les origines* (Paris, 1902);

Armand Praviel and J. R. de Brousse, *L'Anthologie du Félibrige* (ib., 1909); Cecil Headlam, *Provence and Languedoc* (London, 1912).

FELICE, fê-lê'châ, FORTUNATO BARTOLOMEO (1723-89). An Italian author, born in Rome, of a Neapolitan family. He studied at Rome and Naples under the Jesuits and in 1746 became a successful professor of physics at Naples after taking orders at Rome. He fell violently in love with a young Roman matron, the Countess Panzutti (whose husband had put her in a monastery), ran away with her, narrowly escaped capture at Lyons and Geneva, and was finally overtaken at Genoa. Felice was acquitted by the Italian ecclesiastical court, but felt that his career in the church was ruined; so he went to Bern, became a Protestant, and in 1762 established a famous press at Yverdon. He published the *Dizionario universale regionato delle umane cognizioni*, in 42 vols. (1770-75), with a *supplemento* in 6 vols. (1775-76); and 10 vols. of *Tavole* (1775-80), in which he had the collaboration of Euler, Dupuis, Lalande, Haller, and others. Among his other works are: *Sul modo di formare la mente ed il cuore dei fanciulli* (1763); *Principii del diritto della natura e delle genti* (1769); *Lezioni di logica* (1770); *Elementi del governo interiore di uno stato* (1781); *Quadro filosofico della religione cristiana* and *De Newtoniana Attractione, adversus Hambergerum* (1757).

FELICISSIMUS. The leader of a schism in the church at Carthage about the middle of the third century. Bishop Cyprian having withdrawn at the outbreak of the Decian persecution, the church was governed during his absence by the presbyters, among whom was one Novatus, who made Felicissimus his deacon. The records seem to show that Novatus ordained him, regardless of the rule that ordination must be only at the hands of bishops. Felicissimus and his sympathizers objected to the episcopal board of administration which Cyprian had appointed to visit the Carthaginian church in his absence; they were displeased with Cyprian himself on account of his retirement from the scene of action; and they were liberal in dealing with the lapsed (weak brethren, who had abjured their faith under pressure of persecution), readmitting them to the church on easy conditions, which was contrary to Cyprian's express commands. Felicissimus' conduct seemed to warrant his deposition, which Cyprian pronounced as early as 250 A.D. After his return from exile Cyprian convened an important synod at Carthage (251), which excommunicated the offending deacon. Felicissimus, however, had a considerable following. The schismatics completed their organization by the choice of Fortunatus as rival Bishop of Carthage, and Felicissimus visited Rome in the hope of winning sympathy from that important see. His mission was a failure, and Cyprian's vigorous measures of discipline in Carthage, together with the practical agreement as to the treatment of the lapsed, soon reached by Western Christendom, left the schismatics little hope of success. Felicissimus disappears from view, and his movement soon faded out of sight. Some writers find in this schism an effort after presbyterial church government, as against the episcopal system with which Cyprian's name is so prominently identified. Consult Benson, *Cyprian: His Life, his Times, his Work* (New York, 1897).

FELICITAS, fê-lis'f-tûs, SAINT. The name

of two reputed Christian female martyrs. The first is said to have been beheaded at Rome, with her seven sons, under Antoninus Pius, about 150 A.D. The second was a slave who, with her mistress, Perpetua, suffered in the amphitheatre at Carthage under Septimius Severus in 202 or 203 A.D. Her day is March 7. The narrative is better attested than that of many of the early martyrdoms. Consult Harris and Gifford, *The Acts of the Martyrdom of Perpetua and Felicitas* (London, 1890), and Robinson, *The Passion of Perpetua* (Cambridge, 1891).

FELIDÆ (Neo-Lat. nom pl., from *felis*, cat). The cat family, distinguished primarily by possessing retractile claws. See CAT.

FELIX. The name of four popes and an antipope.—**FELIX I** (Pope, 269-274). His pontificate is interesting as an early example of the relations of the Christian Church to the Roman Empire and of the recognition by the state of the civil rights of Christians. In the pontificate of Felix's predecessor, Dionysius, Paul of Samosata, Bishop of Antioch, had been deposed by a council held in that city. Paul having resisted the sentence, the matter was laid before Felix, Dionysius being now dead; and, as Paul held possession of the church and church buildings, the bishops were obliged to claim the interference of the Emperor Aurelian, who was passing through Antioch on his return from Palmyra. Aurelian returned a decision to the effect that the buildings should belong to the person "to whom they should be adjudged by the bishops of Italy and Rome." Felix is, perhaps incorrectly, said to have suffered martyrdom in the persecution of the same Emperor, Aurelian, probably in 274. His day is May 30. Certain letters of a later date have been ascribed to him.—**FELIX II** (Pope from 355 to 358). He was chosen to occupy the Roman see after the banishment of Liberius. When the latter returned to Rome in 358, it is said that the Emperor Constantius proposed that Liberius and Felix should exercise jurisdiction jointly; but the Romans rejected the proposal, and Felix had to give way. He retired to his estate on the Aurelian Way, and, according to the *Liber Pontificalis*, died a martyr's death in 365. In the Roman Calendar he appears as saint and martyr, and his day is July 29, but he is excluded from the number of the popes.—**FELIX III** (Pope from 483 to 492). He was a native of Rome and of the family from which afterward sprang Pope Gregory the Great. His pontificate is memorable as presenting the true commencement of the disruption of the Greek and Roman churches. The contemporary occupant of the see of Constantinople, Acacius, as well as the Imperial court, were favorers of the Monophysite party, who refused to accept the decision of the Council of Chalcedon. (See MONOPHYSITES.) By their influence the Patriarch of Alexandria was deposed and replaced by the Monophysite Peter Mongus. The deposed Patriarch having appealed to Rome, Felix sent two legates to Constantinople to require his restoration; and the legates having failed in their trust, and Acacius still adhering to the heterodox party, Felix assembled a council at Rome, and excommunicated not only the offending legates, but also Acacius, the sentence being pinned by a monk upon the back of the Patriarch's robe while he was actually officiating in the church. Felix had previously rejected the *Henoticon*, or decree of union between the orthodox and the

Monophysites, published by the Emperor Zeno in 482. The schism thus inaugurated (484) but not healed till the year 519. The only literary remains of this pontiff are the letters and other acts of this controversy. He is a saint in the Roman Calendar, and his day is February 25.—**FELIX IV** (Pope from 526 to 530). He was a native of Benevento. His pontificate presents no noteworthy event. He is also a saint in the Roman Calendar, and his day is January 30.—**FELIX V** (Antipope from 1439 to 1440). He was Amadeus VIII, Duke of Savoy. He was born in 1383 and succeeded his father, Amadeus VII, as Count of Savoy in 1391. In 1416 Savoy was erected into a duchy. As a ruler, Amadeus was mild, just, and successful, and distinguished for his piety. In 1434 he resigned the rule to his son and retired to the hermitage of Ripaille, on the south bank of Lake Geneva. There he and some companions lived as hermits. He was nominated in the Council of Basel to succeed Eugenius IV (q.v.) in 1439 and elected on the fifth ballot, although it was objected to him that he had been married and had children, and that he was not an ecclesiastic and had no knowledge of theology or other fitness for the position. His election was not well received, and he so conspicuously failed to get recognition as Pope from the princes of Europe that he voluntarily resigned after a schismatical reign of 10 years. He was then rewarded by being made Cardinal Bishop of Basel, Lausanne, Constance, and Strassburg, and also Papal Vicar-General for all the states ruled by the house of Savoy. He died Jan. 7, 1451. Consult Pastor, *The History of the Popes*, vols. i, ii (London, 1899).

FELIX, ANTONIUS. Roman procurator of Judæa (52-? A.D.). He was a younger brother of Pallas, the favorite of the Emperor Claudius, and, like his brother, evidently a freedman of Antonia, the mother of Claudius. Because of this fact, perhaps, he received the honor, unusual for freedmen, of military command as well as civic office. Of the earliest part of his public career little is known. His character has been painted by Tacitus in darkest colors, as that of a cruel, lustful, and unprincipled man, with the disposition of a slave, who thought that his influential friends at Rome would afford him such protection that he could commit all kinds of crime with impunity. He was thrice married—once to a granddaughter of M. Antony and Cleopatra; the third time to Drusilla, daughter of Herod Agrippa I and sister of Agrippa II, whom he persuaded to desert her husband, the King of Emesa. He succeeded Cumanus as procurator of Judæa in 52 A.D., and probably held the position till 58, although the latter date is disputed. Previous to this he may have been Governor of Galilee for a short time (so Tacitus). His appointment to the procuratorship of Judæa is said to have been at the suggestion of the high priest Jonathan, then in Rome in connection with the trial of Cumanus for misgovernment. His rule was marked by ceaseless disturbances and revolts, against which he acted with a severity that finally resulted in his recall to Rome. Most noted among the uprisings was that of the Zealots, his oppression of whom gave rise, or at least new impulse, to the fanatical Sicarii. (See **ZEALOT**.) The disturbance which occasioned his removal from office was the riot between the Jewish and Syrian inhabitants of Cæsarea, regarding the

equality of their political privileges, in the quelling of which Felix acted with great cruelty but was unsuccessful, and the consideration of the case was removed to Rome, Felix being recalled before a decision was given. It was only through the influence of Pallas that Felix escaped punishment for his maladministration of his office. Nothing is known of his later career.

It was to Felix that Claudius Lysias, for reasons of safety, sent Paul from Jerusalem after his arrest in that city (56 A.D.), and it was before this procurator that the Apostle's first hearings were held. From these no decision was reached. Paul was remanded to prison, where he was kept, though under lenient regulations, through the remaining two years of Felix's term of service, his trial never being completed. There, also, for the sake of pleasing the Jews, with whom his relations were at that time specially strained, Paul was left by the procurator on his return to Rome (Acts xxiii. 23-xxiv. 27). See **NEW TESTAMENT CHRONOLOGY**; **PAUL**; **FESTUS**.

FELIX, ELISE RACHEL. See **RACHEL, MILE**.

FELIX, MARCUS MINUCIUS. A Roman lawyer and Christian, author of *Octavius*, a dialogue in defense of Christianity, probably the oldest Christian work extant in the Latin tongue. Nothing is known of the author. The date of the book is put about 160. It is in Migne, *Patrologia Latina*, iii, and in English translation in the *Ante-Nicene Fathers*, vol. iv (Buffalo, 1889).

FELIX, SAINT, THE MARTYR. A Christian missionary of the third century. Regula, his sister and fellow martyr, and he are said to have been the first preachers of the gospel at Zurich, Switzerland. The legend is that they were executed by the Governor Decius at the order of the tyrant Maximian. Before the Reformation they were venerated as patrons of the city, on whose seal they appear with their severed heads in their hands. Their day is September 11. Consult *Mittheilungen der antiquarischen Gesellschaft zu Zürich*, vols. i and ii (1841).

FELIX HOLT, THE RADICAL. A well-known novel by George Eliot (1866).

FELIXIANS. A Spanish sect of the latter part of the eighth century, so called from Felix, Bishop of Urgella. See **ADOPTIAN CONTROVERSY**.

FELIXMARTÉ OF HYRCANIA, hēr-ká'-ní-a. An old Spanish romance, chiefly notable as being among the works with which Don Quixote fostered his idealism before setting forth upon his adventures. The title character is a valiant knight who slays many giants.

FELIX OF VALOIS, vá'lwé' (1127-1212). A cofounder of the Trinitarians (q.v.). He gave his goods to be sold for the poor and retired to a hermitage near Meaux. In 1198, accompanied by St. John of Matha, he obtained from Pope Innocent III the right to found the Order of the Trinitarians, which worked for the redemption of Christian captives from the Moors. Felix was canonized in 1666, and his feast is November 20.

FELL, JOHN (1625-86). An English clergyman and educator, born at Longworth (Berkshire). He graduated at Christ Church, Oxford, in 1643, was a zealous Loyalist during the Commonwealth, and was appointed canon and then dean of Christ Church in 1660. From 1666 to 1668, and during a portion of 1669, he was vice chancellor of the university. He added several

buildings to Christ Church and greatly improved its scholastic discipline. He also developed the press of the university and encouraged the collation of manuscripts and other scholarly undertakings. In 1684, by command of James II, he expelled from his studentship in Christ Church John Locke, whom he had publicly defended two years before. He became Bishop of Oxford in 1675. His publications include a critical edition (1682) of the works of Cyprian and a critical New Testament (1675); and he aided John Mill in his New Testament studies. He was the subject of a well-known epigram by Thomas Brown (q.v.), and he was bitterly criticized by Anthony à Wood, whose *History of Oxford Fell* published (1674) in a Latin version with notorious editorial changes, especially an attack on Hobbes.

FELLAH (pl. *Fellahin*; Ar. *fellāh*, laborer, from *falāha*, to till). One of the agricultural or laboring class of the people of the Nile valley. In Egypt there was a partial differentiation of the population in early times analogous to that which in India developed into caste (q.v.). This division was perhaps based at least in part on an original diversity or race, and the chief surviving classes are the Bedouin, who are the warlike and wandering people of the deserts, and the Fellahin, who comprise the peaceful and sedentary folk of the annually inundated bottom lands. In general, the Fellahin constitute the peasantry and the Bedouin the soldiery of Egypt; i.e., the distinction is industrial and social rather than ethnic—indeed, there are no constant ethnic differences. As a class, the Fellahin are docile and lacking in initiative, but they retain in form and feature the characteristics of their ancestors, the monument builders of ancient Egypt. The women are especially noted for their comeliness. See EGYPT, ETHNOLOGY.

FELLATAH. See FULAH.

FELLENBERG, fē'lēn-bērk, PHILIP EMANUEL VON (1771-1844). A Swiss agriculturist and educator. He was born in Bern and was educated at Tübingen. After a sojourn in Paris he settled in Bern, whence he was banished during the French invasion in 1798. Subsequently recalled, he was sent as Ambassador to Paris, where his services largely contributed to ameliorate the political conditions then prevailing in Switzerland. Later in life he devoted himself exclusively to the advancement of agriculture and the improvement of Swiss education through experiments on his estate at Hofwyl. In 1804 he established an orphan asylum, which began to be used only after he associated Wehrli with the work in 1808. In 1807 he founded the Literary Institute or Academy for children of the nobles and gentry. A colony for poor boys was established in 1816, and in 1827 a real intermediate school was opened for boys of the middle classes. Normal courses for the training of Swiss teachers were held during vacations. While Fellenberg aimed to provide an all-round education according to the needs of each class, he also hoped by associating all the classes together to bring about a feeling of sympathy and understanding between them. At Hofwyl more than 2000 pupils are said to have been taught. Endeavor was twice made to unite Fellenberg's establishments with those of Pestalozzi; but the two teachers were not sufficiently in harmony. The practical educational influence of Fellenberg upon his native land was,

perhaps, even greater than that of Pestalozzi, while abroad Hofwyl was almost as well known as Yverdon. The manual-training movement in which many American institutions had their origin is probably due to Fellenberg's influence, while at least one well-known school with which Professor Tyndall was associated was established on similar lines in England. His literary activity was comparatively unimportant. Consult Hamm, *Fellenbergs Leben und Wirken* (Bern, 1845).

FELLING. A town in Durham Co., England, constituting an eastern suburb of Gateshead. It has manufactures of chemicals and glassware, and there are large collieries in the vicinity. Pop., 1901, 22,467; 1911, 25,026.

FELLOW COMMONER. A term applied formerly at Oxford, Cambridge, and Dublin universities to those undergraduates who were admitted to colleges by paying at a time when they were intended only for fellows and scholars on the foundation. The class of undergraduates had the privilege of dining at the fellows' table—whence the name, which for a time was superseded by the term "gentleman commoner." Both terms are now practically obsolete, Worcester College, Oxford, being the only instance where the term fellow commoner still appears, and Downing College, Cambridge, being the last which used the term until within recent years.

FELLOWS, SIR CHARLES (1799-1860). An English antiquarian, born at Nottingham. He early showed a fondness for travel and after 1832 spent a large part of his time in the Levant. In 1838 he began a series of journeys from Smyrna into parts of Asia Minor, at that time almost unknown to Europeans. His chief discoveries were in ancient Lycia, where he ascended the valley of the Patara, finding the ruins of Xanthus, the ancient capital, Tlos, and other sites, copying inscriptions, and making drawings of the architecture and sculpture. He then returned to England and published *A Journal Written during an Excursion in Asia Minor*, by Charles Fellows (London, 1839). In 1839 he again visited Lycia and discovered the ruins of no fewer than 13 cities, each of which contained works of art. Another work, entitled *An Account of Discoveries in Lycia, Being a Journal Kept during a Second Excursion in Asia Minor* (London, 1841), was the result of this journey. In 1841 an expedition left England for the purpose of selecting works of art from the ancient cities discovered by Fellows, who accompanied the expedition and directed its operations. Authorized by a firman from the Sultan, they made their selections and returned in the spring of 1842. Another expedition, under Fellows, sent out by the trustees of the British Museum, brought home 27 cases of marbles and casts in 1844. The sculptures, among which are the so-called Harpy and Nereid monuments from Xanthus, are now exhibited in the Lycian Room of the British Museum. In all his expeditions he paid his own expenses. In 1845 he was rewarded by the honor of knighthood. His other works are: *The Xanthian Marbles: Their Acquisition and Transmission to England* (1843); *An Account of the Ionic Trophy Monument Excavated at Xanthus* (1848); a reissue of his earlier journals under the title *Travels and Researches in Asia Minor, Particularly in the Province of Lycia* (1852); and *Coins of Ancient Lycia before the Reign of Alexander: with an Essay on the Relative Dates of the*

Lycian Monuments in the British Museum (1855).

FELLOW SERVANTS. A term used in the rule governing the liability of employers to their employees for injuries sustained by the latter in the course of their employment, to designate those who are employed by a common master in the promotion of a common enterprise, and whose relations are such as to make the safety of any one depend, in the ordinary and natural course of things, on the care and skill of the others. Accordingly an engine driver is a fellow servant of a switchman when they are serving a common employer in conducting a common business; while the seamen of one ocean steamer are not fellow servants of those of another steamer, although the vessels are owned by the same person. In the latter case the relations of the two crews are not such as to render the safety of one dependent, in the natural and ordinary course of things, upon the care and skill of the other.

Although the definition of fellow servant stated above is sustained by the English decisions, by those of our Federal courts, and by those of the great majority of our State tribunals, it has been rejected in a few jurisdictions. There the view has prevailed that the employees of a common master are not to be deemed fellow servants within the rule relating to employers' liability unless they are of equal rank. In these jurisdictions the conductor of a railway train, accordingly, is not the fellow servant of a brakeman; nor is the superintendent of a mill, nor the foreman of a gang of laborers, a fellow servant of those who are subject to his control. If a subordinate is injured through the negligence of his superior, the master is liable for such injury.

In the other class of jurisdictions the master is not liable unless the act is one which he is under an absolute legal duty to perform properly. This legal duty binds the employer to provide for his employees a safe place to work; to provide safe machinery and appliances; to formulate suitable rules and regulations for the safe conduct of his business, if such rules are needed; to warn his employees of danger which they could not or would not ordinarily discover; and to provide suitable superintendents and collaborators. If he delegates either of these duties to an employee, no matter what his grade or rank, the negligence or misconduct of the employee in the performance of that duty is in law the negligence or misconduct of the employer. For it he is liable to the injured servant. Perhaps it should be added that the negligent servant is liable to the person injured by his negligence, whether the latter is a fellow servant or not.

Consult: McKinney, *Treatise on the Law of Fellow-Servants* (Northport, 1890), and Bailey, *The Law of Master's Liability for Injuries to Servants* (St. Paul, 1894). See EMPLOYER'S LIABILITY.

FELLOWSHIP (from *fellow*, Icel. *félagi*, from *félag*, partnership, from *fē*, property, Eng. *fee* + *lag*, a laying together, AS. *lagu*, Eng. *law* + Eng. *-ship*; cf. Icel. *félagsskapr*, fellowship). An institution which arose in connection with the mediæval colleges, originally eleemosynary in their character. The members, or "fellows" (*socii*), as they are called, usually had a boarding place in common and received regular stipends provided for out of the income of the

foundation. Such a college was established at the University of Bologna as early as 1267, and the beginning of the institution at the University of Paris is traced to a permanent though humble provision for sleeping accommodations and for small stipends to be given to 18 scholar clerks, the founder being a pious man, one Dominus Jocius of London. At Oxford a foundation was in 1243 established for two priests, who, while pursuing their studies, should say mass for the soul of their benefactor. In 1249 University College was founded with an income for the support of 10 or more masters of arts, who were studying theology. At Cambridge, St. Peter's College was founded in 1284. The recipients of these benefactions were usually required to pass certain examinations or to have attained a certain standard and often to show their need of such support. Frequently, however, the founder retained the patronage, which was restricted to his kin or to the members of a certain diocese or district. By the University Act of 1854 such restrictions were removed in England. At present the fellowships there are ordinarily confined to the graduates of the university to which the college belongs.

At Bologna the College of Spain still survives, having five or six students. The great Parisian endowments disappeared as a result of wars and revolutions. A fellowship in the Sorbonne is now merely an honorary distinction. In England the fellowships steadily increased in number and value for a time, but the tendency at present is to limit the emoluments and to require some research or other work from the holders. To-day their income ranges from £200 to £300 per annum. To this is added the privilege of occupying certain apartments and in some cases of enjoying perquisites in meals or commons. The ordinary length of tenure of a fellowship is six or seven years; a few are tenable for life. In general they are forfeited should the holder attain to certain preferments in the Church or at the bar and sometimes in the case of his succeeding to property above a certain amount. Except by special vote of the college the holder of a fellowship forfeits it by marriage. The English fellows usually carry on instruction in their own colleges and are frequently professors in the university as well or hold other academic positions. In the newer English universities the fellowships are, as a rule, tenable for from one to three years, are rarely worth more than £150 a year, and require research work from the holder.

In the colleges and universities of the United States the term "fellow" often means trustee, as, in one sense, at Harvard. On the other hand, the ordinary fellowship is an honor bearing with it a certain annual stipend, which varies from \$120 to \$1500. The average amount is, however, about \$500. The fellowships are bestowed according to merit and usually without restriction as to the collegiate institution of which the candidate is a graduate. The holder is expected to pursue graduate work in some special department to which the fellowship is attached, and in most cases this work is to be done at the institution which grants it. Occasionally, however, the fellow is allowed or even required to travel. Some institutions require certain services in connection with instruction from the holders of fellowships, others expect their time to be devoted to study. In 1911 there were 272 fellowships in 13 lead-

ing institutions of the country—California, Chicago, Clark, Columbia, Cornell, Harvard, Johns Hopkins, Michigan, Pennsylvania, Princeton, Virginia, Wisconsin, Yale—of a total value of \$139,250.

Probably the most valuable fellowships are the Kahn traveling fellowships awarded in England, Germany, France, Russia, Japan, and America and of the annual value of \$3000, for the purpose not so much of promoting academic research as international comity through a better understanding and appreciation of foreign conditions. For the current status of fellowships in various institutions, consult: *The Handbook of Graduate Clubs* (Chicago); *Collego Year-Book* (New York, 1896 et seq.); *Minerva Jahrbuch der Gelehrten Welt* (Strassburg, 1892 et seq.). See UNIVERSITY.

FELLTHAM, OWEN (c.1602-68). An English author. He was born in Suffolk and was connected with the household of the Earl of Thomond, at Great Billing, Northamptonshire. An enthusiastic Royalist, his boundless devotion, innocent of euphemistic intent, prompted him to call the dead Charles I "Christ the Second." His name has survived in literature as the author of a thoughtful and agreeable series of moral essays entitled *Resolves*, written "to hold himself and others within the limits of prudence, honor, and virtue" (1st ed., 100 essays, c.1620; 2d ed., 200 essays, 1628; 4th ed., 1631, reprinted by W. Pickering, London, 1846). He also wrote *A Brief Character of the Low Countries* (1652), which was incorporated with the eighth edition of the *Resolves*.

FELLO DE SE (ML., traitor to himself). In criminal law, the technical description for a self-murderer, a suicide. As defined by Blackstone, "A *felo de se*, therefore, is he that deliberately puts an end to his own existence, or commits any unlawful act, the consequence of which is his own death" (*Comm.*, iv, 189). For legal consequence of self-murder, see SUICIDE.

FEL/ON (OF. *felon*, *felum*, *fellon*, Fr. *felon*, ML. *felo*, *fello*, wicked man, from OF. *fel*, It. *fello*, wicked, from Gael. *feallan*, Bret. *falloni*, teachery, Ir. *feal*, evil; connected with Lat. *fallere*, to deceive, Gk. *σφάλλειν*, *sphallein*, to fall, Skt. *phal*, to deceive, OHG. *fallan*, Ger. *fallen*, Icel. *falla*, AS. *feallan*, Eng. *fall*), or PARONYCHIA. A whitlow; properly, a painful inflammation (generally suppurative) around the nail or at the matrix or root of the nail. Commonly, however, the term is applied to a suppurative circumscribed inflammation anywhere on the fingers or thumbs. If superficial, the inflammatory process may undermine the epidermis only; if deep, it may burrow under the sheath of a tendon or under the periosteum. Pathologically felon is a cellulitis, and it is due, in people of reduced resistive power, to an injury, such as a puncture, cut, or scratch, followed by infection of the wound with pus germs. Pain is a prominent symptom, with tenderness on pressure, heat, throbbing, and much tension. If amelioration does not appear before pus is present, under treatment with rest, elevation, and applications of hot-water compresses, incisions must be made so as to release the exudate. Pus generally appears in 48 hours after infection. The incisions must generally be deep and occasionally multiple. A joint of the finger has been lost through delay after pus has appeared. To avoid contraction and stiffness as the cicatrix

forms, the finger or hand must in some cases be supported on a splint.

FEL/ONY. In the common-law classification of crimes, the second in atrocity and in importance, the first being *treason*, and the one comprehending all minor offenses being *misdemeanors*. Omitting treason (which, though sometimes classed as a felony, really stands by itself in our legal system), the distinction between felonies and misdemeanors corresponds roughly to that between grave offenses and such as are less heinous in character. But the distinction is a purely artificial one. Our law has never made a classification of crimes which was based on their inherent nature, but has had reference in its divisions rather to the kind of punishment inflicted. A felony was any crime punishable by forfeiture of the criminal's lands, or goods, or both. Blackstone adds that capital or other punishment might be superadded to the forfeiture, according to the degree of guilt, and in England, for a long time, most felonies were punishable by death. But at common law forfeiture was always an essential part of the penalty, and punishment by death was never the true criterion. In England important statutory changes in the laws as to forfeiture (33 and 34 Vict., c. 23, 1870) have taken away the practical utility of the former test of a felony. But those crimes are still held to be felonies and misdemeanors respectively which were so when the test was operative. Many crimes have been expressly declared felonies by the statutes creating them. Even in the absence of such declaration all crimes for which by statute the penalty of death may be decreed are there held to be felonies. In some of the United States the distinction between felonies and misdemeanors is practically discarded, the punishment for each particular crime being prescribed by statute, and the word "felony," if used at all, being employed in a loose and indefinite sense. In other States the distinction is retained by statute and made to depend on the kind of punishment. Thus, in a considerable number, statutes have declared that crimes punishable by death or by imprisonment in the State prison shall be felonious. In those States it is sufficient to constitute felony that those penalties may be imposed, though the court or jury may be given power to inflict a less severe punishment or to suspend sentence. See CRIME; INFAMOUS CRIME.

FELS, fēlz, JOSEPH (1854-1914). An American manufacturer and single-tax advocate, born at Halifax Court House, Va. After four years as a traveling salesman for manufacturers of soap he undertook in 1874 the manufacture of this commodity at Baltimore with his father, under the firm name of Fels & Co. Later the business was transferred to Philadelphia. Having amassed a great fortune, Fels became an ardent advocate of single-tax reforms, for the promotion of which he established the Joseph Fels Fund of America; to this he contributed \$125,000, and to similar funds in Denmark, Germany, France, Spain, Australia, New Zealand, and Canada he subscribed generously. He also introduced profit sharing in his factories, backed single-tax colonies near Mobile, Ala., and Arden, Del., and established a labor colony at Hollesley Bay, England. As a lecturer and as a magazine contributor, he promoted the single-tax propaganda by his personal efforts.

FELSINA. See BOLOGNA, *History*.

FELSING, fēl'zing, GEORGE JAKOB (1802-83). A German engraver, born at Darmstadt. He studied under his father, Johann Konrad Felsing, and under Giuseppe Longhi at the Academy of Milan, where he won the first prize in 1828 with his "Christ on the Mount of Olives," after Carlo Dolci. He was later influenced by Raphael Morghen and was noted for the accuracy with which he produced the peculiar characteristics of paintings which he engraved, particularly those of the Düsseldorf school. Among his finest engravings may be mentioned: Correggio's "Marriage of St. Catharine"; Raphael's "Violin Player"; Overbeck's "Holy Family"; "Salvator Mundi" (after Da Vinci); "Hagar and Ishmael" (after Köhler); "Jeremiah on the Ruins of Jerusalem" (after Bendemann); "Christ Taken Prisoner" (after Hofmann); and "Poetry and Love" (after Kaulbach). He was an honorary member of the academies of Milan and Florence and of the French Institute.

FELSITE (from Ger. *Fels*, rock). A name applied to the dense igneous rocks which have a stony texture with a fairly light color, and which require the use of the microscope to determine their mineral nature. It is a convenient general term for the classification of rocks in the field and is now used as such, although it was formerly applied in a more restricted sense to the fine-grained equivalents of the quartz porphyries. According to present usage felsite may mean any of the dense volcanic or dike rocks which correspond to granite, syenite, or diorite among the coarsely crystallized class. Thus, basalts and diabases are not included. If a felsite contains scattered crystals of recognizable minerals (phenocrysts), it is known as a felsite porphyry, or leucophyre. Felsites occur in the form of dikes, sheets, and as surface lava flows, the latter often covering many hundreds of square miles. They are found along the Appalachians from Maine southward, also in the Rocky Mountain and Coast ranges, and elsewhere in regions of volcanic activity.

FELT (OHG. *fēls*, Ger. *Fels*, O'church Slav. *plūsti*, felt; probably connected with OHG. *fals*, Ger. *Fals*, fold). A fabric formed without weaving by taking advantage of the natural tendency of the fibres of hair and wool to interlace with and cling to each other. As to the origin of the knowledge of felt making, its beginnings antedate by many centuries the Christian era, and the fabric is mentioned by the earliest writers. In fact, St. Clement is the patron saint of the felt makers, since he was said to have put carded wool between his feet and the soles of his sandals at the beginning of a journey and found it transformed into cloth at its end. On account of greater simplicity of its structure, it is probable that felt was made long before the art of producing cloth by spinning and weaving had been discovered.

The felting quality of fibres of hair or wool results from their structure. When examined by the microscope, the hair of all animals is found to be more or less jagged or notched on its surface; in some animals it is distinctly barbed; and this structure is so directed that the teeth or barbs all point towards the tip of the hair. If a piece of human hair (in which this structure is less marked than in most animals) be held between the finger and thumb, and rubbed in the direction of its length, it will invariably move between the fingers in the di-

rection of its root; for the skin, while moving towards the tip of the hair, slides freely upon it, but, moving in the other direction, against the inclination of the barbs, it brings the hair with it. It will be easily understood that when a number of hairs are pressed together those which lie in opposite directions to each other and in contact will interlock at these barbs or teeth and thus resist any effort to tear them asunder. When once this close contact and interlocking is established between any two or more hairs, they remain attached, but the others that are differently arranged, or not in contact, will still be free to move upon each other; and therefore, if subjected to continual blows, pushing, and pressure, the unattached hairs will be continually shifting until they reach others in suitable positions for clinging together, either by crossing obliquely or by lying in the same line and overlapping at their ends or any other portion. When the hair has a natural tendency to curl, the felting is still more readily brought about by the additional interlacing. Although the felting property is possessed in a preëminent degree by wool, it belongs to the hair or fur of other animals, including the goat, ox, hare, rabbit, and beaver.

The first mechanical process for the production of felt was invented by J. R. Williams, an American, about 1820. Many patents have since been taken out for the various details of felting machinery, but the main principle is the same in all. The wool is carded more or less perfectly into laps of the length and breadth of the web to be made. One layer of these laps is placed upon another to secure the desired thickness of the fabric, and the two outside layers are often of a finer quality than the interior. The bulky sheet is now passed between rollers which are partly immersed in water, and some of them are heated internally with steam. The material is subjected to a beating and oscillatory motion as well as to pressure. The completed fabric is dyed and finished like ordinary cloth. The details of manufacture were at one time strictly guarded trade secrets, each factory having its own processes and specially made machinery.

Felt is used for many purposes. It is employed as a covering for floors and as an upholsterer's material. It is made up not only into hats, but into cloaks and other garments. Carriage linings, polishing cloths, pianoforte hammers, surgical dressings, and many other objects requiring a soft, thick cloth are made from felt. The felt used for women's hats is cut from the piece, but that employed in the manufacture of men's hats is made in special shapes. The material used for men's hats is usually the fur of raccoons, beavers, or rabbits, mixed with some good felting wool. See HATS.

Various fabrics which are technically known as felt, and which possess in greater or less degree the qualities of this material, are manufactured for use in different industries. In these coarse grades of felt cow's hair is often an important ingredient. The felted sheathing used as a nonconducting covering for retaining the heat of steam boilers is a substance intermediate between felt and paper. It is made from woolen refuse and other cheap materials reduced to pulp, beaten and dried. *Lining* and *roofing felts* are used in the construction of buildings and act as nonconductors of heat and sometimes of moisture and sound. Such felts

are made chiefly from coarse animal fibres, such as cow's hair, with varying proportions of mill waste, and incorporated with pitch or asphalt.

The *asbestos lining and roofing felt* is made of pure asbestos, saturated with asphalt, the body fibre in certain brands containing no organic matter. The process of manufacture is similar to that employed in making paper. *Paper-maker's felt* is not a true felt, but a coarse, loosely woven material which has been neither teased nor spun. Little detailed information regarding the manufacture of felt appears to be available in printed form, and such references as can be found are scanty and, for the most part, were written long ago. An interesting chapter on "Felt and Felting" will be found in Murphy, *The Textile Industries*, vol. ii (London, 1912).

Statistics. According to the thirteenth census of the United States, there were in the country, at the end of 1909, 43 establishments devoted to the manufacture of felt goods, producing goods valued at \$11,852,626. The principal products were felt cloths, boot and shoe linings, upholstery felts, trimmings and lining felts, felt shirts, and endless belts for paper manufacture.

FELT, JOSEPH BARLOW (1789-1869). An American antiquarian. He was born at Salem, Mass., and graduated at Dartmouth in 1813. After holding pastorates in the Congregationalist Church at Sharon, Mass. (1821-24), and Hamilton, Mass. (1825-34), he was commissioned by Gov. Edward Everett in 1836 to arrange the Colonial and early State papers of Massachusetts. At this work he continued for 10 years. He was librarian of the Massachusetts Historical Society (1842-58), president of the New England Historic-Genealogical Society (1850-53), and recording secretary of the American Statistical Association (1839-59). He was the author of the following works on New England history: *Annals of Salem* (1827; 2d ed., 2 vols., 1845-49); *History of Ipswich, Essex, and Hamilton* (1833); *The Customs of New England* (1834); *Historical Accounts of Massachusetts Currency* (1839); *Ecclesiastical History of New England* (2 vols., 1855-62); and several other genealogical and biographical works.

FELTON, CORNELIUS CONWAY (1807-62). An American classical scholar, born at West Newbury, Mass. He graduated at Harvard in 1827 and taught first at Geneseo, N. Y., 1827-29. In the latter year he was appointed tutor in Latin at Harvard; in 1830, tutor in Greek; in 1832 he became university professor, and two years later Eliot professor of Greek literature; in February, 1860, he was made president. Among his publications were: *Homer: with English Notes and Flaxman's Illustrations* (1833), a valuable work; *Munzel's German Literature* (1840); *Clouds and Birds of Aristophanes*; *Ancient Literature and Art*; *Poets and Poetry of Europe*; *Panegyrics of Isocrates*; *The Agamemnon of Aeschylus: Classical Studies* (1843); *Guyot's Earth and Man* (1849). In 1853-54 he made a European tour and in 1855 he revised for publication Smith's *History of Greece*, with an edition of Lord Carlisle's *Diary in Turkish and Greek Waters*. A selection from modern Greek writers was published by him in 1856. Other works of his were: "Life of General Eaton," in Sparks's *American Biography*; *Addresses*; and contributions to the *North American Review*. Consult *Proceedings*

of the *Massachusetts Historical Society* (Boston, 1866).

FELTON, JOHN (c.1595-1628). The assassin of the Duke of Buckingham, the favorite of Charles I. He was descended from an old Suffolk family and entered the army at an early age. Of a sullen and churlish disposition, he was generally disliked, and his applications for promotion were disregarded. He felt that he had a special grievance against Buckingham, who had personally refused his petitions, and after reading the declaration of the House of Commons that the Duke was a public enemy, he stabbed him, at Portsmouth, Aug. 23, 1628. The crime was popular with the army and navy and with the people of England generally, as numerous poems and songs were written in Felton's praise. He was tried on November 27, pleaded guilty, and was hanged at Tyburn the next day.

FELTON, SAMUEL MORSE (1853-). An American railroad president, born in Philadelphia. He was educated at Massachusetts Institute of Technology. Beginning railroad work as a rodman in 1868, he rose rapidly, becoming chief engineer, general superintendent, and general manager of various railroad lines between 1873 and 1885. He was vice president of the Erie (1885-90), the Memphis and Charleston, the Mobile and Birmingham (1891-93), and the Knoxville and Ohio (1891-92) railroads, and president of the Louisville Southern and the Alabama Great Southern (1891-93), the Cincinnati, New Orleans, and Texas Pacific (1890-99), the Chicago and Alton (1899-1907), and the Mexican Central (1907-09). He was also receiver of the Columbus, Sandusky, and Hocking Railway in 1897-99 and the Kentucky and Indiana Bridge Company from 1893 to 1900. In 1909 he became president of the Chicago Great Western Railroad, and in 1912 he was elected president of the Pere Marquette Railroad.

FELTRE, fèl'trà (Lat. Feltria). A city in the Province of Belluno, north Italy, 850 feet above sea level, and 34 miles northwest of Venice (Map: Italy, D 1). The bishopric was united in 1819 to that of Belluno. Feltre has a Venetian Gothic palace with fine mural paintings, a beautiful cathedral, a seminary, a gymnasium, an industrial school, a hospital, an orphan asylum, and a municipal pawnshop, established in the fifteenth century. It is a market for silk, wine, and oil, spins silk and bleaches wax, and makes baskets and ironware. In 1809 Napoleon gave Marshal Clarke the title of Duke of Feltre. To Pamfilo Castaldi, as the discoverer of the art of printing and as a native of the town, a monument was erected in Feltre in 1868. Pop. (commune), 1901, 15,243; 1911, 15,465.

FELTRE, MORO DA. See MORO DA FELTRE.
FELUC'CA (It., from Ar. falāka, fūlk, ship, from falaka, to be round). A small, fast-sailing vessel, formerly much used in the Mediterranean and still common there as a coasting or fishing vessel. It has usually two masts, each carrying a lateen sail, and is also fitted with 8 to 16 oars. Feluccas are not ordinarily decked over, but a small shelter is sometimes built aft.
FEMALE QUIXOTE, THE. A satirical romance by Charlotte Lennox (1752), written in ridicule of the artificial fiction of Gomberville and Scudéry.

FEME COVERTE, fēm, or fām, kū'v'ert (OF,

protected woman). The common-law term for a married woman, having reference to her legal status. The corresponding status of an unmarried woman was indicated by her legal description as a *feme sole*. When the *feme sole* married, she was said to be under *coverture*, which signified that her legal personality had for many purposes become merged in that of her husband. These terms have lost their significance in those jurisdictions in which married women have been invested with the full legal rights and responsibilities of unmarried women. The legal status of the *feme covert* will be considered under the title HUSBAND AND WIFE. See also MARRIAGE; WOMAN.

FEMERN. See FEHMARN.

FEMINISM (from Fr. *féminisme*, from Lat. *femina*, woman). Feminism is a term which originated in France about 1890 and has been used increasingly in English during the last 20 years to describe the body of ideas and motives which lie at the root of the modern woman movement. Feminism as a social theory stands for the complete emancipation of woman, economic, political, social, and personal. It would elevate her from a condition of inferiority and perpetual minority similar to that of children to a position of full equality with men, in which she would find open to her every opportunity without distinction of sex. Feminism, its supporters take care to emphasize, is thus merely humanism. It signifies the emergence of woman as a human individual with the same rights and the same duties as all others of the species. Emancipation, the struggle for freedom from the trammels of custom and law, is, however, only one side of the feminist movement. Freedom cannot come without responsibility, and the feminist realizes that with her bonds she is casting away also her privileges. Her plea is for no discrimination, favorable or unfavorable, for the right to share with man all the activities of modern civilization. This movement is no recent upgrowth, no upstart radicalism of the last decade, but is the natural accompaniment of the whole transformation of thought, on the one hand, and of the economic basis of society, on the other, which distinguishes the last two centuries from the rest of human history. To understand feminist thought one must therefore comprehend its historical development and its sociological implications.

The modern feminist movement traces its origin to the same forces which gave birth to the modern idea of democracy—to the forces which brought about the great French Revolution, the American Revolution, and the transformation of England from a feudal aristocracy to an industrial democracy. These forces, which gathered power towards the end of the eighteenth century, sprang partly from the unconscious economic transformation of society which involved the breakdown of the feudal system and the growth of a new industrial organization, and partly from a conscious intellectual current which took its rise from the great French philosophers of the eighteenth century, Voltaire, Rousseau, Montesquieu, and others, the general tendency of whose thought may be summarized in the watchwords of the democratic movement: liberty, equality, and fraternity.

The new reliance on the efficacy of the human reason as against the weight of tradition and authority, the discovery of the enormous influence of environment in determining character,

combined with a romantic feeling for the majesty of simple humanity and the claims of the individual against tyrannous external influences, created a new confidence in the possibilities of human development and led to the enunciation of the doctrine of natural rights. It was not until the eighteenth century that these ideas were applied to men in general, and then only after long and bloody struggles with the conservative and aristocratic forces of the past. This period thus gave birth not only to a women's movement, but more immediately to a men's movement, or, rather, to a human movement of which men were able for various reasons to reap the advantage more swiftly than women, but, say the feminists, no more surely. Feminism is thus merely one aspect of modern humanism and has developed into a special movement merely because it had special obstacles to overcome and not because of any difference in its final aims. For both the men's and the women's movements these aims are still those of the French Revolution interpreted in the light of contemporary conditions: *liberty* for the individual in so far as it does not encroach upon the liberty of others; *equality* of opportunity for all alike, rich and poor, man and woman; *fraternity*, the spirit of comradeship, coöperation, and brotherly love as a basis for social solidarity.

Since, then, modern humanism, or the "discovery of man as man," makes its appearance only in the eighteenth century, it is not surprising that there are few traces before that period of feminism, which may be called the discovery of woman as man. But these traces appear in precisely the periods in which the estimation of the human personality and the general level of culture were high. In the Greece of the third and fourth centuries B.C. which developed the highest ideals of personality to be found in the ancient world, the position of one class of women at least, the *hetairai*, was very favorable. They mingled freely with the men in public gatherings and shared to a great extent their high intellectual culture, privileges which were forbidden to the respectable women, who lived a secluded *harem*-like life. In this period, too, Plato in his *Republic* first advanced the idea of the complete social and political equality of the sexes. He based his claim upon the proposition that, so far as mental and moral qualities were concerned, there was no qualitative difference between the sexes. The sexes are to coöperate in the ideal state in all their activities and in their gymnastic and musical education as well as in their study of science and art.

At the time of the Renaissance also there are certain anticipations of modern feminism. The otherworldliness of early Christianity, with its denunciation of the joys of the flesh and of woman as their incarnation, had not been favorable to woman's development; but the revival of pagan feeling at this period, the unabashed joy in beauty and life, lifted the ban. In the new feeling of individuality, in the new interest in art and literature, in the new consciousness of personality, women shared with men. They were educated with great care, appeared in public in Italy and Spain as artists, poets, and orators, and gathered about themselves at their courts the talent and learning of the time. But this was a purely individualistic and aristocratic development and not, like the feminism of modern times, democratic and social.

One of the earliest feminist works was produced in the fifteenth century by Christine de Pisan, the French poetess, who made a plea in her *Cité des dames* for the emancipation of woman. Somewhat later Mademoiselle de Gournay, the foster daughter of Montaigne, proclaimed the equality of the sexes, and Marguerite de Valois, the wife of Henry IV, attempted to prove the superiority of the feminine intellect. Jacqueline Guillaume published in 1665 *Les dames illustres* (*Illustrious Ladies, wherein is proven by good and strong arguments, that the feminine sex surpasses the masculine in every way*). In Germany the humanistic influence was strong. Cornelius Agrippa entered the lists in favor of the higher education of women, and in the seventeenth century a few German women reached a high stage of intellectual development. But these as well as the ladies of the great salons of the seventeenth and eighteenth centuries were rather sporadic phenomena than indications of any general improvement in the position of women.

In England the modern discussion begins with the appearance of Mary Astell (1668-1731), who demanded better education for women and criticized the unnatural relations of the sexes. In 1694 she published anonymously *A Serious Proposal to the Ladies, by a Lover of their Sex*; in 1696, *An Essay in Defence of the Female Sex*, and in 1700 *Some Reflections upon Marriage*. Her works met with general contempt and ridicule, though she found a strong supporter in Daniel Defoe, who remarks that "all the world are mistaken in their practice about women. For I cannot think that God Almighty ever made them so delicate, so glorious creatures, and furnished them with such charms, so agreeable and delightful to mankind; with souls capable of the same accomplishments with men: and all, to be only Stewards of our Houses, Cooks and Slaves."

In the France of the eighteenth century, where the idea of the rights of man was germinating, the rights of woman received scant consideration. Even the writers of the many utopias who attempted to picture the ideal state think of her only as wife and mother, and by some her moral and social inferiority is distinctly preached. Few appreciate her social significance, and fewer still her social and political rights. Man belongs to the state and woman to man is the theme of all the utopists. By a strange paradox Rousseau himself, upon whose philosophy more perhaps than that of any other writer modern feminism rests its claims, thought that the sole function of woman was to please man, and that her power to please was in direct proportion to her stupidity. But his doctrines could not escape in time their logical implication, though he himself did not choose to make it. His conception of a society founded on natural principles and ideas of social utility rather than on mere tradition and authority, and of the individual as the centre and supreme end of that society, is at the root of modern feminism. By the end of the eighteenth century the ferment of the philosophy of Rousseau among women became visible. On Oct. 28, 1789, a few months after the outbreak of the Revolution, the Parisian women presented a petition to the National Assembly for equal political rights, and in the same year Olympe de Gouges (q.v.) presented to the Queen Marie Antoinette her *Déclaration des droits de la femme* (*Declaration*

of the Rights of Woman). The philosopher Condorcet included a proposal for full equality of the sexes in his plan for a new constitution in 1793. From 1789 to 1793 Revolutionary clubs of women flourished in Paris (*Société des femmes républicaines et révolutionnaires, Amies de la Constitution*, etc.). Petitions for the full political, economic, and legal equality of woman were made. The first feminist paper, *Le Journal de l'Etat et du Citoyen*, was published. The women attended meetings of legislative assemblies and took part in the Revolutionary movements, often with arms in their hands. Their enthusiasm was so great, in fact, that it became embarrassing to the Committee of Public Safety, who ordered the suppression of the women's clubs, 9th Brumaire, 1793, in spite of their protests. A period of reaction succeeded, which culminated under the Napoleonic régime in the harsh attitude of the Code Napoléon, the spirit of which is well expressed in the remark of Napoleon himself, "There is something which is not French, that is, when a woman may do as she pleases." The Code embodied in law the antifeministic spirit of the period and gave the husband a position of absolute superiority in the marriage relation—a position which holds good to-day in every part of Europe in which the influence of the Code Napoléon persists.

The idea of the rights of woman was carried to England by Mary Wollstonecraft, an Englishwoman whose own life, full of hardships and responsibilities, had given her an insight into the woman question far in advance of her contemporaries. Her *Vindication of the Rights of Woman* applied the French social philosophy to woman as well as to man. Natural rights, she says, are the property not of one sex, but of all humanity. The system of gallantry is really insulting and offensive. If woman is inferior to man morally and intellectually, that is due not to her inner nature, but to her social position and poor education. She demands the participation of women in legislation and the opening to women of all professions as well as of various trades and businesses in order that they may be protected from prostitution, which she analyzes clearly in its relation to the economic and social dependence of woman. She demands an equal moral standard for both sexes as the only sound basis of social ethics. Mary Wollstonecraft's work aroused contempt and indignation in women as well as men. Horace Walpole called her a "hyena in petticoats," and her influence over her contemporaries was slight.

The philosophical radicals of the school of Bentham, who dominated English social philosophy during the earlier part of the nineteenth century with their idea of utility as the final test of social institutions, were indifferent to the idea of the rights of woman, as indeed they were to all abstract theories of natural rights. James Mill expressed himself in 1824 adversely and was answered by William Thompson in his *Appeal of One Half of the Human Race, Women, against the Pretensions of the Other Half, Man, to Retain them in Political, and thence in Civil and Domestic Slavery* (London, 1825). John Stuart Mill, however, was destined to become the prophet of the modern Englishwomen's movement, which he sought to justify on the ground not of abstract right, but of social utility, in his *Subjection of Woman* (1867), a most eloquent arraignment of the social and political oppression of woman. He demanded her com-

plete legal and political emancipation from the condition of slavery in which she had been kept. This work, which aroused much enthusiasm and much acrimonious discussion, drew the English-women's movement into line with the predominant middle-class liberalism with its emphasis on political liberty and the efficacy of the suffrage as a means of emancipation. Through Mill's influence a movement sprang up which resulted in the modern English woman's suffrage movement, the most powerful of its kind in the world.

Of greater importance for the emancipation of woman, however, than any enunciation of theories was the change in the economic basis of society which began at the end of the eighteenth and continued through the nineteenth century, through which the old system of manual and agricultural production was replaced by machine industry. The vast changes wrought in the social structure by this industrial revolution were the factors which made not only possible but necessary the economic independence of woman. By the system of factory production a new division of labor was created which demanded and indeed enforced a readjustment of women in all social classes to their new economic position. The home lost its old importance as an economic institution now that all the necessities of life were produced outside of it, and the woman of the home in the middle classes became conscious of the necessity of finding new fields of work outside in order to satisfy her ideals of usefulness or even to make a living for herself. Thus was laid the foundation for the so-called middle-class or bourgeois women's movement. For the women of the working classes, however, the new conditions assumed a more serious aspect. They and their children were employed in vast numbers in the factories instead of men because of the comparative cheapness of their labor, and were subjected to long hours, starvation wages, disease, and misery. The old domestic relations disintegrated completely, and woman exchanged subjection in the family for subjection in the industrial system. The result was demoralization for the man, deterioration, physical and moral, for the woman, and degeneration for the children. The evils of woman and child labor have occupied the attention of economists and reformers with ever-increasing force for the last century, and have been one of the most serious problems which the woman movement has had to face. The women of the middle classes early realized their responsibilities towards their working sisters, and the improvement of the condition of the working woman has always occupied an important place in their programme, through such measures as improved technical and general education for working women, employment bureaus, cheap hostels, legislation for improvement of working conditions and the restriction of hours of labor, provision of crèches for children, and insurance of motherhood.

With the development of the capitalistic economic system, Socialism made its appearance and the result of the application of Socialistic philosophy to the woman question produced a new feminism, the extreme radicalism of which has often, though erroneously, been ascribed to feminism in general. The utopian Socialists of France, whose theories were much in vogue before 1848, included in their ideal of a future state the complete equality of men and women.

Fourier bitterly attacked the ideals of bourgeois marriage and proposed freer sexual relations with the monogamic union as the ultimate ideal. The followers of Saint-Simon also cherished the free union as their ideal and proposed equality of men and women in all departments of public life in their future state. These theories were carried so far by *Enfantin* that they led to a division among the leaders of the Saint-Simonian school and the final break-up of the movement. Their ideas had had a great effect upon the thought of the time, however, especially through their embodiment in a genius like *George Sand*, whose literary reputation gave currency to her feminist ideas. A fearless prophet of Saint-Simonism in the struggle for truth and justice, she held up the ideal of the free personality for woman and the right to dispose of her love as she felt inclined.

With the supersession of utopian by modern Socialism a new type of Socialistic feminism appeared, based upon an analysis of actual economic conditions and their effect upon woman's position. Already in the *Communist Manifesto* (1847) Marx and Engels had alluded to the woman wage-worker, driven out of the home, underbidding men in the labor market, and suffering more than they from capitalistic exploitation. For the woman worker as well as the man they could see no liberation but in the abolition of the capitalistic state. *August Bebel* gave this idea its greatest development in his work on *Woman and Socialism*, which has become the gospel of Socialist feminists. He analyzed the position of woman on the basis of the economic interpretation of history and concluded that bourgeois marriage had developed from bourgeois property relations; that it did not even satisfy the sexual instinct, as was indicated by the growth of prostitution; that it was not suited to modern economic relations and should therefore be changed to suit moral and natural requirements. A new order must be established in which the means of production should be the property of society, all possible technical and scientific improvements should be made in industry, the working hours reduced to a minimum, and the physical and spiritual development of society raised to the highest level. Only thus, says *Bebel*, can woman become a useful and independent member of society, develop all her physical and intellectual potentialities, and fulfill her sexual rights and duties. Marriage should be a private contract, and the rearing of children should become a social responsibility. The German Socialist party followed the same line of policy, vaguely at the Congress of *Eisenach* in 1869, more definitely at *Gotha* in 1875, and finally at the Congress of *Erfurt* in 1891 made a clear enunciation of the theory of equal rights: "The Social Democratic party of Germany struggles, then, not for new class privileges, but for the abolition of class mastery and of the classes themselves, and for equal rights and equal duties for all without distinction of sex and race. From this point of view it combats in present society not only the exploitation and oppression of the wage-worker, but every kind of exploitation and oppression, be it directed against a class, a party, a sex, or a race." This declaration sums up the attitude of Socialists in general on the woman question. They have stood everywhere for woman suffrage and the abolition of all legal disabilities of women. They have often

refused, however, as in Germany, to coöperate with the middle-class women's movement on the ground that they represented the interests of the working woman which were opposed to those of the middle-class woman and that the movement of the working women was a class struggle and not a question of sex. Their main efforts are concentrated on organizing the working women economically in trade-unions and politically in the Socialist party.

The current of thought during the nineteenth century gave considerable support to feminism. The Romantic movement in art and literature during the first half of the century introduced a new personal type of love and a higher spiritual ideal of the sexual relation, which reacted upon the old patriarchal institution of marriage and tended to elevate it to a loftier plane of spiritual comradeship. This Romantic tendency in feminism culminates at the end of the century with the work of Ellen Key, the Swedish writer, who would bring beauty and harmony into life with a renaissance of love. She deprecates any type of feminism in which woman, in her search for equal opportunities and her eagerness to use them, forgets the all-essential elements of her happiness, love and maternity. Only the highest type of monogamic relation with perfect equality and comradeship can secure happiness in love. But even if excluded from love, maternity can still make woman happy. Upon this argument she bases the right to motherhood for every woman. For maternity is essential to woman's spiritual and physical development. But the child is the aim of all life. It should be the child of love and of health. Only the healthy and strong have a right to reproduce the species.

The most important scientific contribution to feminism during the last century has been the growth of knowledge with regard to the position of woman in the past and its causes. Beginning with purely historical works, such as those of Ségur (1803), Laboulaye, *Recherches sur la condition civile et politique des femmes depuis les Romains jusqu'à nos jours* (1843), and Legouvé, *Histoire morale de la femme* (1848), the research on this question extended into the field of anthropology, and a number of important works on the position of woman and the nature of marriage in primitive society, beginning with those of Bachofen, Lewis Morgan, and others, have introduced the evolutionary point of view into discussions of the woman question. The institution of marriage and of the family and the position and "sphere" of woman appeared in the light of science to have evolved gradually to their present state and to have differed greatly according to the special society in which they were found. This dynamic standpoint has revolutionized discussion upon feminism.

In the field, too, of a realistic understanding of sex great advance has been made. Researches into sexual psychology and pathology have thrown valuable light upon many sides of the woman question and supported the demand that social institutions be better adapted to procure the happiness and welfare of the individual. The work of Forel, Krafft-Ebing, and others on the Continent, and that of Havelock Ellis in England, are examples of this movement.

A new attitude towards woman has entered into literature, especially since the advent of Ibsen, whose great dramas presented to society

a tragic picture of woman as an individual struggling in the toils of a hypocritical social system and emphasized the claims of the personality in woman even against those of society and the family. This tendency has since permeated literature to an increasing extent. The work of Björnson and Strindberg in exposing "social lies" and that of Ellen Key in developing a constructive philosophy of feminism have had an enormous effect, not only in Scandinavian countries, but in the world outside. In present-day English literature a marked feminist tendency is manifest in the work not only of Bernard Shaw and H. G. Wells, but also in that of Arnold Bennett and other milder spirits. Feminism has always counted some of the most illustrious French writers among its defenders, such as Dumas, Victor Hugo, Michelet, Marcel Prévost, and the brothers Margueritte. The most conspicuous recent contribution is that of Brieux, whose exposé of the marriage system and the foundations on which it rests has created a profound impression in all countries.

The recent movement in philosophy, with its extreme individualism, on the one hand, and, on the other, its emphasis upon social solidarity, has given a great impetus to the women's movement, the results of which are visible in the recent literature of the subject, typical examples of which are Olive Schreiner's *Woman and Labor*, in which not only the right to work is demanded for women, but their duty to work is emphasized with an eloquent attack upon the "parasitism" of the modern woman of the middle classes, and the works of Charlotte Perkins Gilman, who bases upon biological and sociological premises her protest against a one-sided civilization or "androcentric culture," which can only be improved by the full participation of woman in the "human" work of the world and the restriction of her purely sexual functions within moderate limits, the reorganization of domestic work and child rearing on an efficient basis.

But feminism as a whole is by no means a conscious philosophical movement. The entrance of women into industry and the professions is often merely the result of economic pressure, but independence brings with it the desire of greater independence, and gradually the psychological foundations for a conscious movement are laid. Furthermore, even where this stage has been reached every possible gradation of radicalism is to be found—from the Christian feminism of European countries, which would improve somewhat woman's legal position without changing her relation to society and the family, to the feminism of the Socialists and extreme individualists, which would emancipate her completely in both these relations. The feminist movement as a social process includes all these manifestations, conscious and unconscious, conservative and radical. It is thus impossible to assign to it any definite uniform programme. Equality before the law and the right of suffrage are the most general demands at present, but many women's organizations in European countries do not indorse this. From the beginning the movement has stood strongly for education, or the right to knowledge, in the higher fields of science and philosophy, in the lower grades of primary and secondary education, and in the field of industrial and technical education, so that woman may be prepared professionally and industrially to take her place beside man in the work of the world—a step for which another

struggle has to be made, which takes the form of demands for admission to all posts in the government service and for equal pay for equal work, for the right to practice medicine and law, the conquest of new fields of activity, the right of married women to work, the raising of the general level of women's wages and salaries, and the protection of the working woman from exploitation. Next comes the campaign against prostitution and the white-slave traffic. For the economic independence of woman not only freedom to work is necessary; she must be legally protected in the possession of her property and earnings. This involves the acceptance in law of the principle of "separation of goods." More radical proposals involve salaries for wives, widows' pensions, the state endowment of motherhood and the state responsibility for the rearing of children, and the emancipation from domestic work of the highly trained woman.

Lastly, feminist thought has developed æsthetic and moral ideals of its own. Dress reform, the introduction of hygienic æsthetic dress freed from the tyranny of style and the confinement of corsets, and the increase in athletic activity and open-air life will produce a new physical type of woman in whom freedom and beauty will be combined, say the feminists. At the same time this new woman will have quite new ethical principles, a stronger feeling of social responsibility, and a higher ideal of love and of maternal duty.

The nature and tendencies of feminism can perhaps best be explained by showing their actual course of development in certain typical countries. Feminism, though an international movement rising everywhere from the same causes, intellectual, economic, and moral, exhibits local differences in the individual countries. In Great Britain its aims have been predominantly political since the formation in 1866 of the National Society for Woman Suffrage under the influence of John Stuart Mill. The great interest which Englishwomen have taken in politics found expression in 1884 in the formation of the Primrose League, a powerful organization of Conservative women formed to aid the Conservative party in its support of church, throne, and empire. This was followed by the Women's National Liberal Federation, and by the Women's Liberal Unionist Association in 1888. Through these organizations Englishwomen have exercised a great indirect influence upon politics. The improvement of the legal position of women early occupied the attention of the women's movement. Until 1870 the married woman, when not protected by a marriage contract, had no rights with regard to property and could not even make a legal will. In 1870 women were given complete control over their earnings (in Scotland, 1877). In 1882 the Married Women's Property Act for Great Britain and Ireland extended this control over a woman's whole property and earnings and gave her a legal personality distinct from that of her husband.

Since the time of Mary Wollstonecraft the Englishwomen's movement had given up its attitude of sex antagonism and the struggle for "natural rights" and had come to realize that the position of women was due to economic and social causes for which no individual or sex could be held responsible, but that new economic conditions required a readjustment of the rela-

tions of the sexes and a coöperation of both in the world's work. During this period the movement was for the most part a middle-class one. The attempt was made to assist the middle-class woman, whose work was being taken out of the home into the factory, to take her place in the new division of labor. Education was necessarily the first point of attack. The foundation of Queen's College (1848) and Bedford College (1879), the admission of graduates of the latter to degrees in London University in 1879, the foundation of Girton College (1869) and Newnham (1871) at Cambridge and of Somerville College and Lady Margaret Hall at Oxford in 1884 and of Royal Holloway College in 1888 made provision for real academic training for women. In Cambridge and Oxford they are still refused degrees, though they are allowed to take the examinations. The University of Wales and several of the newer municipal universities, however, now admit women on a purely coeducational basis. The entrance to the professions, especially those of law and medicine, was more difficult. Women are not yet admitted to the bar, and were allowed to practice medicine in 1876 only after bitter struggles. There were, in 1912, 553 women physicians in Great Britain. The feminists of the period after 1850 were interested in promoting, not only higher education for women, but also secondary and lower education, and also in providing technical and industrial training which would enable women to enter new fields of industry. In this latter object they were very successful through the formation of educational and industrial unions. In general education also they effected great improvements. In 1867 the Schools Inquiry Commission inquired also into female education at their instance, and in 1869 the Endowed Schools Act recommended the use of a part of educational endowments for girls' education. Also through private gifts new schools were built, and a transformation worked in the education of girls.

The struggle against the legal regulation of prostitution began in England under the inspiration of Mrs. Josephine Butler. In 1864 the system of regulation had been introduced into England by the Contagious Diseases Act, which established inspection at certain garrisons and seacoast towns. In 1869 Mrs. Butler and others made a protest on moral, political, and hygienic grounds, organized the National Union of English Women, held meetings, and addressed petitions to Parliament. In 1870 they acquired their own paper, the *Shield*. In 1874 the campaign was extended to the Continent, became international in scope, and has continued in other countries, though it attained its ends in Great Britain in 1886. There have also been attempts at mitigating the social evil—rescue leagues, vigilance societies, and recently severe legislation against procurers in the Criminal Law Amendment Act. Trade-union organization is progressing among working women under the stimulation of Miss Mary McArthur, who reports 300,000 organized working girls in 1912 out of 5,500,000 women engaged in industrial occupations. In some cases also the women belong to the men's unions. Schools for mothers have been organized, and a Women's League of Service to prevent infant mortality. Motherhood insurance, a beginning of which was made in the Insurance Act of 1911, is now being demanded on a wider scale, and for the more

radical nothing short of a generous endowment of motherhood by the state will suffice.

The whole energies of the movement seem concentrated now upon the attainment of the suffrage, but only as a means for carrying out a wider programme of feminism. In France feminism was identified with Socialism in the revolution of 1848. Two attempts were made, in 1848 and 1851, by the Socialists Considérant and Leroux to obtain the suffrage for women. Feminist societies were organized and feminist journals were founded: the *Politique des Femmes*, *L'Opinion*, *Voix des Femmes*, and feminists and Socialists went into exile together at the fall of the Second Republic. The feminism of the Second Empire was of a more bourgeois character. Maria Desraismes and her friend Léon Richer were the leading spirits. They founded in 1876 the Society for the Improvement of Woman's Condition (*Société pour l'amélioration du sort de la femme*) and conducted an energetic campaign for the civil and political equality of the sexes, of which the controversy with the antifeminist anarchist Proudhon and the conversion of Dumas fils were interesting features. Victor Hugo, Emile de Girardin, and other illustrious men became adherents of the cause. Petitions presented to the Chamber of Deputies were without results. In 1880 was founded *La ligue pour le droit des femmes*, in 1890 *L'Union universelle des femmes*, in 1891 *La Solidarité*, and in 1896 *Le féminisme chrétien*. A committee founded in 1896 to urge special legal reforms was successful in 1907 in procuring the legal control of a woman over her own earnings. Another group, *L'Egalité*, founded by Madame Vincent, devotes its attention exclusively to historical research on the position of women. Philanthropic organizations of women have a society of their own. In 1897 was founded a daily feminist paper, *La Fronde*, which is edited, published, and printed exclusively by women.

The morality movement, which follows the inspiration of Mrs. Josephine Butler, includes a society, *Adelphia*, which, with the institution *Œuvre libératrice* (founded 1901), attempts to aid unfortunes and assist them back to a normal life. Trade-union organization has progressed and has been assisted by middle-class women, between whom and the Socialist women there is no such sharp line drawn as in Germany. The movement for women's education has been assisted by the government since 1880, since it fell in with the anticlerical policy of the Republicans, who sought to get the education of girls out of the hands of the Catholic church. State lycées and normal schools for women were organized, and in elementary education both sexes were treated alike. French universities have admitted women since 1867. They have obtained the privilege of practicing medicine and law. Madame Curie became in 1907 the first woman professor at the Sorbonne. The National Council of Frenchwomen has promoted trade-union organization among women, investigated the marriage laws, and organized a woman's suffrage department. Since 1907 the paper *La Française* has appeared. In 1909 the French Woman's Suffrage Society was organized.

The legal position of Frenchwomen is still very low under the influence of the Code Napoléon. The woman is strictly subordinate in the marriage relation, the authority of the father is unlimited, and the investigation of

paternity in the case of illegitimate children is still practically forbidden.

In Germany the "emancipation of the heart" which came to a few women with the Romantic movement in literature was followed by the democratic enthusiasm of the liberalism of 1848, but the general decline of liberalism since that time carried with it the enthusiasm for political rights, and the suffrage movement has never been so strong in Germany as some other sections of the feminist movement. This is due also to the difficulty in leading women of different political convictions to coöperate and to the wide gulf between Socialist and middle-class feminists. The latter have, since 1865, followed the English example in encouraging women's work and education. In that year they founded the *Berliner Letzte Verein* for the improvement of the industrial efficiency of the girls of the upper classes, and also the *Universal German Women's Union* for the improvement of women's education as a whole and the bettering of the conditions of the working women. Since 1888 a more radical movement has developed which demands complete equality of the sexes everywhere and places its political and social programme more in the foreground. The *Union of Progressive Women's Unions* was formed with this policy, to encourage instruction in hygiene, the protection of the working woman, the improvement of the legal position of women, the training of women for philanthropic work, and the admission of women to the higher state examinations, and to avoid the separation of middle-class and working women. It had, in 1910, 23 branches with 2000 members and published its own paper, *Die Frauenbewegung*. In 1889 the *Union of Woman Employees* was founded and now numbers about 150,000 members. It conducts a labor bureau, sick and accident insurance, loan bureau, evening and commercial schools, and supplies its members with free legal aid. It includes many subordinate unions and exercises a powerful effect upon legislation. A campaign for morality has been conducted since 1889, when the society *Jugendschutz* was founded. It has conducted a hygienic and ethical propaganda and has established a home for working girls.

The Socialist women are organized on a basis of equality with men in the Socialist party and refuse all coöperation with the bourgeois women. They have recently conducted special congresses of their own in conjunction with the party congresses and conduct a paper, *Die Gleichheit*, under the editorship of Clara Zetkin. They have been very successful recently in organizing working women into Socialist trade-unions.

The conquest of higher education has been recent. In 1891 women were admitted to lectures at Heidelberg and in 1901 allowed to matriculate. Prussia and most other states followed, though with hesitation. In 1908 Prussia abolished all limitations, and now no German university is closed to women. In the summer semester, 1911, women to the number of 2252 constituted 4.4 per cent of the entire student body in German universities.

In the United States, which has been called "the promised land of feminism," the woman movement is based upon the French Revolutionary tradition of natural rights, which appears in American form in the Declaration of Independence; in practical activity it dates from the period of the antislavery agitation, in which

women were especially active. Their demand for human rights and freedom for the negro drew their attention to their own condition. In 1840 the American women delegates to the Anti-slavery Congress in London were refused admittance upon the ground of their sex; there-with one of them, Elizabeth Cady Stanton, conceived the idea of a movement against woman slavery, an idea which she carried into effect in 1848 with a conference to which she presented a list of the grievances of women drawn up in the form of the Declaration of Independence. In 1850 a second conference was held, the National Woman Suffrage Convention, and the complete enfranchisement of women demanded. After the war the propaganda revived, and in 1869 two suffrage associations were formed which united in 1890 to form the National American Woman Suffrage Association.

The agitation for political equality is the most conspicuous side of the feminist movement in the United States at present, but the other lines of development should not be ignored. In the field of education extraordinary progress has been made. With the opening of Oberlin College to women in 1833 on equal terms with men began a great movement towards coeducation which has affected all of the public high schools and State universities and many of the private institutions as well. In addition women have several finely equipped colleges of their own.

The suffrage movement has made great progress in recent years. Four States were added in 1912 to five which already permitted women to vote and strong campaigns are being conducted for the franchise in other States. A constant agitation is also carried on at Washington for a Federal amendment in favor of woman suffrage. (See WOMAN SUFFRAGE.)

Perhaps the most important aspect of feminism in America is the extent to which women are entering every profession and every field of labor naturally and efficiently. Women police, justices of the peace, and even mayors are no longer a novelty, and women are holding important public offices with increasing frequency. The number of women workers in all occupations has risen from 2,647,670 in 1880 to 4,005,532 in 1890, 5,319,397 in 1900, and, in 1910, 8,075,772, as compared with 14,744,942 men in 1880 and 30,091,664 in 1910. In 1910 in domestic and personal service 2,620,857 women were employed and 2,740,176 men. In professional service there were 673,418 women and 1,151,708 men. The number of women physicians had risen from 2432 in 1880 to 13,687 in 1910, of women lawyers from 75 to 1343 for the same period, of government officials from 2172 to 14,544, of journalists from 288 to 4181, of women in literary and scientific pursuits from 2764 in 1890 to 13,521. If this process continues at its present rate, it means a revolutionary change in the position of women. There are no indications of its abatement. Rather the demand becomes more insistent every year that no discrimination be made in the civil service or in other public positions against the employment of women on the ground of their sex.

For the working woman a programme of protective legislation is being put into operation, including restriction of hours, improvement of working conditions, widows' pensions, regularization of work, and a minimum wage; and trade-union organization has progressed rapidly

with the assistance of the National Women's Trade Union League and its local branches.

A fresh feminist agitation, hardly yet organized but apparent in the press and in literature, is making irreconcilable demands for absolute emancipation of women in every field on the lines of the more radical European movement, and for the present has monopolized the title "feminism" in the public mind. With the success of the suffrage agitation, which present conditions seem to indicate, strong support will be given to all the other phases of the women's movement, political, economic, and social.

Feminism is progressing more slowly in countries of inferior culture or undeveloped economic conditions, but there are extraordinary indications of its presence in all countries, including Turkey, India, Japan, and China. An extraordinary feminist movement has developed also in the Scandinavian countries.

The feminist movement is organized further on an international basis, and in this American women took the lead. The National Council of Women, formed in 1888 at the instigation of Mrs. May Wright Sewall, soon extended to other countries and became an international organization which now includes 23 national unions. It aims to establish regular intercourse between the women's organizations of all lands and holds congresses every five years, the last of which took place in Rome in 1914. In 1904 the International Women's Suffrage Alliance was formed. By 1910 it included 26 national branches and since 1907 has published its own organ, *Jus Suffragii*, and has held several international congresses.

For the progress of the movement in other countries, consult the works of Dr. Schirmacher and Mrs. Snowden. See WOMAN SUFFRAGE, *Women in Industry*.

FEMMES SAVANTES, fām sā'vānt', Les (Fr., The Learned Women). A comedy by Molière (1672), adapted from *Les précieuses ridicules*. It is a satire on feminine pedantry.

FEMUR (Lat., thigh). The thigh bone. In general terms, it consists of a shaft, very slightly curved, and two extremities. The upper extremity bears two projections, called the greater and lesser *trochanters*, for the attachment of muscles, and a short *neck*, nearly at right angles to the shaft, terminated by a hemispherical *head*, which, being received into a cavity of the pelvis called the acetabulum, forms the hip joint—a ball-and-socket joint. The lower extremity of the femur has on each side an en-

largement called a *condyle*, or knuckle. The articular surface of the condyles is hemicylindrical, as also is the somewhat depressed space between them, called the *trochlea*, and with the large bone of the leg, called the *tibia*, forms the knee joint—a hinge joint. The femur is attached to the pelvis by two ligaments—a capsular ligament, which incloses the head and neck, and the *ligamentum teres*, a short ligament which joins the head with the bottom of the acetabulum. It is attached to the tibia by several ligaments, placed in different positions, to combine strength with freedom of motion; the most important of these bands are the lateral ligaments and the crucial ligaments. The crucial ligaments cross from one member of the joint to the other in oblique directions. Powerful extensor and flexor muscles, besides performing their ordinary functions, aid in keeping the parts in apposition. The femur has a wide range of distribution in the animal kingdom and is not the exclusive property of warm-blooded animals. In man it is the strongest, longest, and largest bone. In the whale it is only rudimentary. In fishes it is not represented, but is developed in varying degrees in mammals, birds, reptiles, and amphibians. It is a short bone in the ruminants and the horse family. In the tortoises the curve is considerable, while it is almost straight in carnivora, bats, etc. In many reptiles it is rudimentary. For illustrations, see SKELETON.

FEMUR, COMPARATIVE ANATOMY OF. Although certain comparative anatomists have attempted to find in the metopterygium of the fin of a fish a homologue of the femur, it is beyond question that such a bone is not actually found below the more or less terrestrial amphibians. In the short-legged members of that class (Urodela) the femur is a short and relatively unimportant bone; but in those forms whose chief mode of progression is by leaping (Anura) it becomes the longest and most important bone of the hind limb. Among reptiles we find the femur, when present, a short but very stout bone, reaching its strongest development among the Crocodilia, though the lizards and turtles are not far behind. Among snakes a femur is present only in the families Tortricidae and Pythonidae, and in those cases it is greatly aborted. The femur is sometimes lacking in lizards, and in other cases is rudimentary. Among birds the femur is a short, stout bone embedded in muscles and concealed beneath the skin; its upper, articular end is rounded and almost at a right angle with the main shaft; the terminal condyles are large, and on the outer is a ridge which plays between the heads of tibia and fibula. Most mammals possess a well-developed femur, the relative length of which depends very largely upon the habits of the animal and the proportions existing between the fore and hind limbs. No femur is present in the manatee or the dugong, and it is wanting also in most of the Cetacea. In some whales, however, which possess a rudimentary pelvic girdle, a small bone lying just outside the latter is thought to represent the femur. Monkeys possess femurs most nearly like that of man, and this is especially true of the anthropoid apes; yet even the gorilla, which in this respect is the most manlike of all the apes, has certain peculiarities of the femur by which the expert can distinguish it from man. These differences between the femurs of apes and man

are so readily recognized that when the famous remains of *Pithecanthropus erectus* were found in Java by Dubois, their position, intermediate between man, whom they approach in cranial character, and apes, was determined by the examination of the femur, this bone showing certain pithecoïd characters quite strongly.

FENCE (by aphæresis for *defence*, *defense*, from Lat. *defendere*, to ward off, from *de*, down + *fendere*, to strike; connected with Gk. *belveu*, *thoinem*, to strike). In agriculture, a barrier, more commonly constructed of stones, rails, planks, pickets, or wire, used to inclose some space or to separate it from an adjoining area. Fences are primarily intended to confine farm animals to a definite area, or to prevent those of one farmer trespassing on the premises of his neighbors.

Legal Aspect. Fence laws are quite generally in force in the United States, but their requirements are very variable. In some cases they require each person to fence in his own stock, but not to fence out the stock of others. In other cases the reverse is true, especially in sparsely settled regions, where the amount of unoccupied land is so much larger than the occupied area, and the grazing system prevails. Great legal diversity also obtains in different States regarding division fences, highway and railway fences, and what in a legal sense constitutes a fence.

Necessity. Fencing is more general in the United States than in European countries. It has been stated that the farm fences of the United States cost more than the farm buildings. Much fencing is undoubtedly done that is useless, expensive, and unsightly. Many fences, like the zigzag fence and the stone fence, take up much valuable land that might otherwise be profitably cultivated, and besides they harbor weeds, insects, etc. The extent to which fencing is necessary depends mainly upon the laws in force. Where every owner of stock is liable for the damage done by them, the fencing may be limited to that required to keep the stock confined on his own premises. Still, even in this case many prefer completely to fence their premises rather than be annoyed by the unpleasant consequences of depredations of a careless neighbor's stock. However, it may be laid down as a general rule that from both æsthetic and economical considerations only such fences should be maintained on a farm as are absolutely necessary.

Rail Fences. When timber is abundant, as it is in the early days of the settlement of well-timbered regions, the zigzag, worm, or Virginia rail fence is commonly used. Such a fence properly built, of good timber, is durable and effective, but is wasteful of land and timber and is expensive when the supply of the latter becomes limited. It is then often replaced by other cheaper forms of pole, brush, or wicker fences, or by the neater and more substantial board fences.

Stone Fences. In regions where stones abound, fences have been built to serve the double purpose of a fence and of a place of deposit for surplus stones. They are substantial, but expensive, on account of the labor required in their construction, and often wasteful of land, because they too frequently become merely long piles of stones around the fields.

Sod Fences. Where both timber and stones are lacking, sod has been successfully employed

in the construction of fences. At best, sod fences are makeshifts.

Hedges. In England and other European countries hedges are employed in place of fences to a much greater extent than in the United States. The objections to them are that they are slow of growth, expensive to keep in order, that they "draw" the adjacent land, harbor weeds, insects, etc., and throw a considerable amount of land out of cultivation. There are many cases, however, in which the hedge proves both useful and ornamental. The favorite hedge plant in England is the hawthorn. In the Middle and Southern United States the orange is probably most commonly used. The arbutus and the boxwood (for evergreen hedges) and the privet are also frequently used. When used as fences, hedges are frequently planted on embankments of ditches or double ditches.

The Picket Fence. This form of fence is used especially for inclosing yards and gardens. It may be constructed of cheap split pickets, or of the very ornamental and expensive kind, the variety of styles being almost infinite. The picket fence forms an especially effective barrier for small animals. It may be constructed entirely of wood, of wire and wood, or of iron.

Wire Fences. Post and wire fences are probably more extensively used than are any other kind, especially in regions where timber is scarce. The single wire does not resist changes of temperature and is not as strong as the twisted wire. Firmly twisted steel wire, with barbs at short intervals, is the kind most widely used. The barb-wire fence takes up little space, is not destroyed by fire, is easily repaired, and is readily adapted to inequalities of surface. It may also be so constructed as to form an effective barrier to stock and trespassers of all kinds. The principal objection urged against it is its liability to injure stock. For this reason it is better suited to large areas than to small inclosures in which animals are likely to be more or less crowded. Various means have been proposed for overcoming this danger, but with only partial success. Two-strand twisted wire, with two-pointed and four-pointed barbs, are used, as well as flat and twisted, barbed and unbarbed, flat steel straps. The barbs should be just long enough to repel infringing animals without inflicting serious injury. Various implements have been devised which greatly facilitate the construction of wire fences. It is generally considered that two strands of barb wire, 22 inches apart, the lower 22 inches from the ground, will turn horses, cattle, and young stock, and one strand is sometimes used as a temporary barrier for the larger stock. A fence of three strands, 12, 23, and 42 inches from the ground, is more effective than a two-strand fence. Four-strand fences, with the strands 5, 12, 22, and 48 inches from the ground, are commonly used, with or without a baseboard close to the ground. Five strands, it is claimed, will turn dogs, pigs, poultry, and other small animals. With embankments, fewer strands are required for an effective fence. It is common to use posts 8 feet apart, as in board fences, but fewer posts are frequently made to serve. The corner posts should be securely braced, in order that the wires may be tightly stretched.

Flood Fences. Across streams subject to floods, or sloughs too wide for floodgates (see below), fences are often a necessity. These are usually constructed in panels, on logs, which

are linked together and fastened to posts on the banks with iron couplings, so that the fence rises and falls with the flood.

Hurdles, or Portable Fences. These are often useful. They may be constructed of wood or of wire, in a variety of ways, depending upon the purpose for which they are to be used.

Gates have generally replaced the more primitive bars, being more slightly and convenient. When properly made of well-seasoned lumber or of metal, they are very durable. The styles of construction are almost infinite. Gates for roadways should be at least 14 feet wide and should be well braced so that they will not sag. The styles of hinges and especially of fastenings are almost as numerous as the kinds of gates. (See also GATEWAY.) When fences cross streams or gulleys subject to flood, it is necessary to employ floodgates, which are panels of fence suspended on hinges so that they yield to the force of the flood and resume their position when it subsides.

Posts. The best timber for posts is probably supplied by red cedar, yellow locust, black walnut, white oak, and chestnut. Timber for posts should be cut when the sap is dormant, e.g., in midwinter or in August. The bark should be removed before setting the posts. Various means of preserving posts have been proposed. Soaking the part to be placed in the ground in kerosene and afterward coating with coal tar has been found effective. Soaking in blue vitriol (1 pound of vitriol to 40 of water) and in hot creosote and charring have also been recommended. The creosote treatment has been found most practical by the United States Forest Service. In recent years, as a result of scarcity or high cost of suitable timber for the purpose, concrete posts for wire fences have come into considerable use.

In general it may be said that fences should be built only when absolutely necessary, and then substantially constructed of good material, since a good fence will prove more economical in the end than a poor one.

FENCE, FENCING (IN LAW). At common law, a landowner is under no duty to maintain a fence, either to mark his boundary line or to protect his premises from trespass by man or beast. On the other hand, every one is under a common-law duty to keep his cattle from trespassing upon the land of others. Accordingly the introduction of fences, in agricultural regions at least, appears to have been for the purpose of keeping cattle in rather than of shutting them out. They were resorted to as a convenience rather than a protection.

While the common law does not confer upon a landowner the right to force his neighbor to maintain a fence, it does permit him to acquire such a right by grant or prescription. When the right is so obtained, it is called an easement, and the land, whose owner is thus bound to maintain a fence, is said to be subject to a servitude. A contract under seal by a property owner with his neighbor to build and maintain a fence upon the land of the former for the protection of the neighbor's premises, not only creates a personal liability enforceable against the promisor, but it may, if so intended, create an incumbrance upon his land in the nature of an easement. A prescriptive liability of this character is not common, nor is it easily established. One who claims it must be prepared to show not only that the person charged has uniformly repaired the fence in question, but

also that he has so repaired it at the request of the claimant and in recognition of the latter's right.

In some of our States the common-law rule that landowners are not bound to fence against trespassing cattle has been rejected by the courts, as unsuited to the conditions and usages of a new country; and the rule has been adopted that the owners of cultivated lands can recover for damages done thereto by trespassing cattle only when they are inclosed by good and sufficient fences. This rule has been recognized by the United States Supreme Court as applicable to the public lands of the Federal government. In all of the States, and in England, the common-law doctrine has been modified by statute. It is impossible here to describe this legislation in detail, but its characteristic features are these: 1. It imposes upon adjoining landowners the duty of contributing equally towards the erection and maintenance of division fences between the improved or cultivated portions of their lands. 2. These fences are to be so built that the line between the two estates shall pass through the middle. At common law the owner, who was bound to maintain a division fence, was obliged to construct it wholly upon his premises. 3. What constitutes a lawful fence is generally fixed by the terms of the statute, or is left for definition to local authorities. In England barbed wire fences along highways are prohibited; but in this country their use is permitted. 4. Division fences are intended, under modern legislation, as a protection against cattle rightfully on adjoining land, and only against those. In some cases, however, the statutory duty to fence is an absolute one. Such, as a rule, is the duty of railroad companies. Until they erect and unless they maintain the statutory fences, they are liable to all damages inflicted by their engines and cars upon cattle straying upon their tracks. They may even be liable to passengers and employees who are injured in collisions with trespassing cattle. The private-property owner, however, owes a duty of fencing only to his immediate neighbor. If his fence conforms to statutory requirements, he is not liable to his adjoining neighbor for the trespasses of his cattle upon the latter's land, unless they are unruly beasts. On the other hand, he cannot recover for the trespasses of his neighbor's cattle if his own fences are defective. A fence is a part of the land. This is true even of a rail fence, although no stakes are set into the ground. The same doctrine has been applied to fencing materials which are temporarily detached from the soil when there was no intention of diverting them from their original use. They are real estate, not chattels. See Hunt, *Law of Boundaries and Fences* (London, 1896); Thompson, *Law of the Farm* (San Francisco, 1896); id., *Law of Boundaries and Fences* (Albany, 1874); Thornton, *Railroad Fences and Private Crossings* (Indianapolis, 1892).

FENCE LIZARD. A small, active, and harmless iguanid lizard (*Sceloporus undulatus*), common throughout all the warmer parts of the United States and Mexico. It is exceedingly variable in color, but Eastern specimens are usually brown green above and whitish below, with an indistinct stripe on each side, above which is a double series of narrow undulating V's, pointing forward. The males have a black mark diverging from the chin to each shoulder,

and other blue and black patches and marks on the under surface which are lacking in the females. Texas and Sonoran examples form the paler variety *consobrinus*, and a Rocky Mountain variety (*tristichus*) is distinguished by its green color and eight crossbands.

This little animal is exceedingly active, running swiftly, dodging about tree trunks with incredible agility, and hiding beneath loose bark, etc., for repose and safety. It climbs trees to some extent, but keeps mainly near the ground, darting along fences and prostrate logs in pursuit of insects or in fear of hawks and similar enemies. De Kay states that it has some power of changing its colors, and that when irritated it elevates its spinous scales and bristles into a formidable appearance; it is, however, entirely harmless and makes an amusing pet. It multiplies by eggs laid in dry earth, probably in little groups, in early summer. "The eggs are long and narrow, are covered with a tough coat . . . and are abandoned to their fate, but when the young are hatched they are treated with the utmost gentleness by all the adults." For systematic facts, consult Cope, *Crocodylians, Lizards, and Snakes* (Washington, 1900); for breeding habits, Hay, *Batrachians and Reptiles . . . of Indiana* (Indianapolis, 1893); Ditmars, *The Reptile Book* (New York, 1907); also popular accounts in the books of De Kay, Abbott, Sharp, and similar writers.

FEN'CIBLE. A term formerly applied to bodies of militia, yeomanry, or volunteers in Great Britain. They were enlisted entirely for local defense. The name is now practically obsolete except as a designation of a few historic corps. Formerly not an uncommon title assumed by organizations of State militia in the United States; as, "The State Fencibles."

FEN'G. Specifically, the art of attack and defense with sword or rapier, but frequently employed so as to include the use of such weapons as foils, singleticks, broadsword, quarter-staff, bayonet, lance, etc. There is not much

FIG. 1. FENCING POSITION WITH TWO-HANDED SWORD.

evidence to justify the assumption that fencing as an art was practiced before the advent of the rapier in the sixteenth century, although it has been conceded that some crude system

of fence must have been necessary for the proper play of the *hâche d'armes*, or poleaxe, a weapon about 5 feet in length and used with both hands. The knight depended, as a rule, on the strength

FIG. 2. TWO-EDGED SWORD AND BUCKLER.

and temper of his armor for defense and on the force and accuracy of his lance thrust for attack; but the employment of a shield to ward off attack, by sword or other weapon, suggests that some form of fence was known. The swords in use at this time were the heavy two-handed swords (Fig. 1), the bastard sword (a heavy weapon, which, however, might be used with one hand), and the ordinary single-handed sword. Each type was made with double edges and a point. From the middle of the sixteenth to the middle of the seventeenth century was the most prolific period in the variety of weapons introduced, and also the period from which fencing may properly be said to date. The most important weapon of the group was the long Spanish-Italian rapier, with its adjuncts, the poniard (Fig. 3) or the cloak (Fig. 4). It was practically a development of the cross-hilted sword, and arrived at its most perfect form early in the seventeenth century, when the "swept" hilt gave place to the "coup." Armor

FIG. 3. COMBAT WITH RAPIER AND DAGGER.

was no longer worn, so that combatants fought stripped to their shirts and, owing to the deadly nature of a rapier thrust, were compelled to cultivate the art of fence. Italian fencing masters were in demand, but, owing to the length

and general unwieldiness of the weapon, their instruction was far from the complex method it afterward became. In avoiding an opponent's rapier recourse would be had rather to change of position with the body than to changing positions of the weapon itself, and parries with the dagger were equally few. The period of the rapier has been described as the most quarrelsome period in history. During the reign of Louis XIII of France the rage for dueling became more virulent than ever, and the use of the rapier, and consequent knowledge of its practice, grew to be widespread, with the inevitable result of considerably altering the style and size of the rapier. The hilt gradually took the shape of a cup, and the blade was so shortened and lightened that the possibilities of attack and defence were greatly increased, and a weapon for the left hand became unnecessary. The *parry*, and as a natural consequence the *feint*, which with the previous heavy and unwieldy weapon had been impossible, became now an absolute necessity and, combined with the *lunge*, marked a great advance in the art of fence. The "*lunge*," or forward movement of the leading foot, was first suggested, so far as is known, by a celebrated Italian fencing master of the sixteenth century, Di Grassi, whose work, published in 1574, and translated into English by "J. G., Gentleman," in 1594, was long regarded as an authority. At this time such footwork as was practiced consisted of passes, or steps forward, backward, or to either side; with the addition of *voltes* and *demi-voltes* as needed, during which the swordsman was required to keep

FIG. 4. COMBAT WITH RAPIER AND CLOAK.

the knees as nearly straight as possible. The universal prevalence of dueling (q.v.) during the eighteenth century brought about further improvements in the weapons, and finally evolved the slender featherweight rapier now known as the *small sword*. The elementary circular, or counterparry, proved to be of sufficient value to compel sword makers to alter the shape of the blade, by fining down its excessively broad forte, and making it taper gradually from hilt to point; thus, the "walking sword" of the closing decades of the eighteenth century became as light and supple as is the fencing foil of the twentieth century. Among the many famous fencing men of this period may be mentioned the Chevalier de Saint-Georges, the half-breed son of a rich planter of Guadalupe; the French Chevalier d'Eon de Beaumont (1728-1810), so long believed to be a woman; and Angelo, the founder of a family for several generations conspicuous in the annals of fencing in Great Britain. Since the days of armor, up to the eighteenth century, protection for the face or other parts of the body in a fencing bout was unknown, and all the great fencing masters of the rapier recommended enormous buttons—in many instances, it is recorded, as large as

a tennis ball—which, being affixed to the point of the weapon, afforded a measure of protection to an opponent. During the earlier part of the small-sword period it had also been the custom in the *salles d'armes* for a fencer to withhold his *riposte* after making a successful parry, in order that his opponent might have time to recover from his lunge and escape any possible injury to his face. The elder La Boesière is said to have been the original advocate of protection for the face, but his idea met with a very indifferent reception from the fencing fraternity, who vehemently denied the necessity of such protection on the part of themselves. When first introduced, the mask was of solid metal, in which openings were made for the eyes, and thus left exposed the very parts that most needed protection. An accident, by which a prominent instructor lost the sight of an eye, soon demonstrated the necessity of eye covering, which in time led to the present meshwork mask. At the beginning of the nineteenth century the use of the glove, plastron, sandals, and mask had become general, and while gentlemen no longer carried the walking sword, a form of it still holds sway in France, in the *épée de combat*, the favorite weapon of duelists throughout the world.

Fencing in France. It is supposed that Henri Saint-Didier, who taught fencing in Paris about 1670, was the first to give names to the different thrusts then in use, such as *main-drette*, *renverse*, *fendante*, *estocade*, and *imbrocade*. Pater, a later teacher, divided the various parries into five distinct classes, viz., prime, seconde, tierce, quarte, and quinte; and similarly with few exceptions every other term used in the art has had a French origin. Modern fencing in France owes most of its perfection to the military academy of Joinville-le-Pont, near Paris, established by the government in 1872, and known as the High School of Military Gymnastics. In this institution are trained the masters at arms, who on graduation are assigned to the various regiments and corps of the French army. The number of men graduated each year, however, is in excess of the number of appointments to be filled, so that many of them are compelled to enter into competition for their livelihood with the *prévôts* or lieutenants of the civilian masters throughout the country. In Italy fencing is not now so popular as it is in France, nor is the Italian method as practiced by its leading present-day exponents as distinct from the French as it was formerly (although the original Italian method is still enthusiastically taught at Naples), but is apparently being dispossessed by its French rival from all the countries in which it was formerly supreme.

Fencing in the duel is influenced in France largely by the rules governing the use of foils in the *salles d'armes*. There is usually an umpire to enforce the rules and see that the combatants maintain the regulation distances from each other, so that only the hand or arm is in danger. Occasionally a duel will have a fatal termination, either designedly or by accident; but in the vast majority of encounters, should either combatant make too desperate an attack or rush, the umpire interferes, and the first scratch ends the affair. In Germany the duel is more consistently prohibited than in France (see **DUELING**); but even there, duels with the rapier or dueling sword are of occasional oc-

currence and are almost invariably of a serious character. The student duels are fought with the *Schläger*, a pointed sword with a long double-edged blade, sharpened only towards the point, and the fencing in vogue partakes more of the violence and action of the Italian than the more reserved style of the French.

Some of the more important positions and principles of fencing are as follows: Movements for attack are called thrusts, and those for defense parries; a *feint* is a movement designed to mislead an opponent. When on *guard*, the body is so placed as to present a profile to the opponent; the right foot forward, the right arm half bent, with the elbow at the distance of about 10 inches from the body, the left foot 20 inches behind, and at right angles to the right foot, knees bent, body erect and well poised on the hips, inclining slightly to the left, so as to facilitate the right leg in the lunge. The *attack* is an endeavor to hit, either by a simple or a composite thrust—*simple* when resulting from a single movement, and *composite* when resulting from several. A *straight thrust* is a direct hit, obtained by straightening the arms and lunging, and a *disengagement* is a change of lateral lines followed by a straight thrust, which differs from the *coupe*, or *cut*, in that it is under instead of over the opposing weapon. To *riposte* is to attack after having parried—either immediately or after a single interval; and to *counterriposte* is to attack after having parried a *riposte*. The *coupe de temps*, or *time thrust*, is an attack anticipating or surprising an opponent in the preparation of his own; and the *coup d'arrêt*, or *stop thrust*, is a rapid attack developed during the advance of an opponent. *Feeling the blade* is an operation demanding long practice, as well as a delicate sense of touch; by it contact without pressure is made with the opposing weapon, which together with the knowledge gained by the eyes will indicate the beginning of an attack and enable the defense to deflect a thrust without unnecessary violence. An attack may be delivered either at the breast, or on the right (the right side of the body or face), on the left (corresponding to the right attack), and below, the region under the sword arm. There are at least 10 parries requisite to meet all the thrusts that can be directed at the body, designated by the old French ordinal numbers: prime, seconde, tierce, quarte, quinte, six, sept, octave, counter-tierce, and counterquarte. To confuse an opponent by making a *feint*, or to secure position after retreating, resort is had to the *appel*, which is executed by striking the right foot smartly on the ground. The art of disarming an opponent by twisting or forcing his weapon out of his hands is but little practiced, owing to modern fencing etiquette, which does not permit the striking of a defenseless man. The essence of good fencing is to exercise caution and prudence before attempting a thrust, and never to *riposte* until after the parry has been made. Retreats must be covered by parries, which should invariably be well and closely made. To husband the strength and keep cool, together with a constant watchfulness for a successful lunge, constitutes almost certain success against even a superior swordsman, should the latter be impetuous and indiscreet in his lunging. The use of the *small sword* is now principally confined to dueling, and proficiency in its play in nondueling countries is sought

more as an accomplishment or recreation than as a means of self-preservation. The small sword is for pointing only, which is of all attacks the most effective, since in fencing the point is made with the full force of the arm reinforced when lunging by the weight of the entire body; a combination impossible in the "cut," which can only be delivered by the force of the arm alone.

The substitute for the short sword is the foil (see Fig. 5), and on no account should practice

FIG. 5. HAND POSITION, WITH FOIL.

against an adversary be engaged in without the protection of a wire mask for the face. There should also be worn a leather breast-plate or pad, to cover the entire right side and hang a little distance over the lower part of the body. It should also have stitched to it a leather collar buttoned at the back, for the protection of the neck.

The foil is made of yielding steel, with a leather-covered or rubber button fixed to its point. The temper of the foil should always be ascertained before commencing practice, by placing the point on the ground and pressing downward until the blade assumes a considerable arc of a circle, after which it should be allowed to spring back by suddenly releasing the point. A well-tempered foil can at all times be straightened out by placing it under the foot, bent part uppermost, and then drawing it backward to the point.

Sword Fencing. The sword is a weapon made for the purpose of cutting by the delivery of a blow. It has two distinct parts available for attack and defense, in addition to its point: (a) The centre of percussion, or that part of the sword in which the greatest force of the blow is concentrated, comprising about one-third of the blade's length from the point; and (b) the forte, which measures about one-third the sword's length from the hilt, and in which the best strength for defense is maintained. Although the weight of the sword tells against its utility as a thrusting weapon, it is nevertheless fashioned for use with the point, and the thrust is relied upon as an additional means of attack. Any such scientific use of the sword as is possible with the rapier is entirely precluded by its weight, consequently it has fewer combinations for attack and defense. Sword fencing consists of the cut, guard, and point, a combination equally available in the case of sword versus sword, and sword versus lance or bayonet.

The *singlestick* is a light ash rod or stick, used as a substitute for the sword, the exercises with which are identical.

Fencing in America. The most important fencing competitions in the United States are under the direction of the Amateur Fencers' League of America, which was organized in 1891 and is now affiliated with the Amateur Athletic Union. Four competitions are held each year, which are open to amateurs of all countries, viz.: (1) *American Championship*: With foils, dueling swords, and sabres; (2) *Foil Handicap*: One held by each division of the Am-

ateur Fencers' League of America, at New York, and other centres; (3) *Team Championship*: With foils; teams consisting of three or four men; (4) *Junior Team Championship*: With foils; teams of three men, in which no man is allowed to participate who has ever won any A. F. L. A. foil medal. The intercollegiate championship is usually competed for by teams from the principal colleges and universities of the country; the Intercollegiate Fencers' Association, founded in 1894, includes Harvard, Yale, Columbia, Annapolis, Cornell, West Point, Pennsylvania, and Princeton. There are many important fencing clubs and organizations throughout the country, the most influential being the Fencers' Club of New York, founded in 1883. Philadelphia is regarded as the most important fencing centre next to New York, closely followed by Boston, San Francisco, Chicago, and St. Louis. The German-American athletic societies in every State of the Union also make fencing a prominent feature of their gymnasia, and more than any other factor maintain a strong interest in the development of broadsword and sabre work. The Fencing Section of the New York Turn Verein was founded in 1850; its first master was the afterward famous Franz Sigel.

Bayonet Fencing. The bayonet is a weapon made entirely for the thrust, consequently it is most effectually used when in the hands of an experienced user of the rapier. Of all forms of fencing, that with the bayonet is most exclusively military, yet curiously enough is only within quite recent times receiving the attention it has so long deserved; at a period, too, when in the opinion of many the opportunities for bayonet contact in actual warfare have been reduced to a minimum. The old form of bayonet exercise, like the old manual of arms, is now practically a thing of the past and is being everywhere superseded by bayonet attack and defense practice, in which bayonet is opposed to bayonet, and the modern principles of fence are employed. For gymnasium bayonet fencing, a spring bayonet is employed; so that, when contact is made in the thrust, the impact forces the bayonet back on its spring. When employed against the sabre, the bayonet is used on the same principle as the foil, except that, owing to its weight and form, only the more simple foil movements are possible; the two weapons are on fairly equal terms, however, as the sabre, from its weight and shape, is similarly situated. Whatever advantage the bayonet has in length, the sword has in general handiness. A bayoneteer usually engages in tierce or quarte, from which he is enabled to make a straight thrust, a disengagement, feint a straight thrust and disengage, or feint a disengagement into one line and disengage into another. The swordsman will parry with prime all straight thrusts and disengagements received over his blade, and with seconde those received under the blade. A greater variety of returns are possible, however, if tierce and quarte are employed to meet a thrusting attack at the breast. Against a dismounted swordsman, the bayoneteer will seek to keep the former outside his point, to secure which he will constantly threaten different parts of the swordsman's body and thus keep him on the defensive. On the other hand, the swordsman will aim to get inside the point of the bayonet, when by seizing the rifle with the left hand he has his opponent at his mercy.

Against a mounted swordsman the bayoneteer will centre his attack on the left or near side of the horseman and thus shorten the swordsman's reach. If opposed to a lancer (mounted), he will make his attack on the right or lance side and strive to get inside the point. Manuals of fencing for all fencing weapons, and particularly the foils and singlesticks, are plentiful. Consult: Hutton, *The Sword and the Centuries* (New York, 1901); Thimm, *A Complete Bibliography of Fencing and Duelling* (London, 1896); Czeipek, *Die Fechtkunst im Duell* (Graz, 1897); Hergsell, *Die Fechtkunst im XV. und XVI. Jahrhundert* (Prague, 1896); Ristow, *Die moderne Fechtkunst* (ib., 1896); *Praktische Bajonett-Fechtschule nach der Bajonettir-Vorschrift für die Infanterie* (Berlin, 1889); Pollock and others, *Fencing, with a Complete Bibliography* (London, 1902); Pavese, *Foil and Sabre Fencing* (New York, 1905); Brock, "Fencing in America," in *Outing Magazine* (ib., 1912-13).

FENCING THE TABLES. A term applied in Scottish Presbyterian churches to the address before the administration of the Lord's Supper, setting forth who are "the worthy communicants" and warning others from partaking.

FENDALL, JOSIAS (c.1620-?). A proprietary and Colonial governor of Maryland from 1656 to 1660. He was born probably in England. He was one of Lord Baltimore's trusted agents in his Maryland colony, and as a reward for his services Lord Baltimore made him a large grant of land and commissioned him Governor. He was unable to enforce his authority, and was taken prisoner by the Puritan faction, but was released on taking oath that he would not interfere with the established government. Leaving Maryland, he proceeded to England, where he conferred with Lord Baltimore and acted as his adviser in his attempts to secure from Cromwell a recognition of his proprietary rights. In November, 1657, Fendall returned to Maryland as Governor. In the interregnum which followed the abdication of Richard Cromwell, Fendall seems to have deserted his former benefactor; for he placed his resignation in the hands of the Assembly and accepted from it a new commission as Governor. The newly established government, after a brief existence of six months, was again superseded by the proprietary, Philip Calvert being appointed Governor in place of Fendall, who was imprisoned. He was tried in the following spring (1661) and sentenced to be banished, but upon promising obedience was permitted to live unmolested until 1681, when, again being implicated in an insurrection, he was banished and his estates confiscated.

FENDER (from *fend*, abbreviation of *defend*). A device for protecting the sides of ships or boats from chafe or other injury. They are of numerous kinds. Rope fenders, made of large soft rope covered with canvas, are used for heavy boats, surrounding the hull just below the washboard. Cork fenders, much used on board modern vessels, consist of a closely plaited rope netting in the shape of a bag, filled with cork, and supported in place by a small rope. Heavy wooden fenders, which are merely solid cylindrical pieces of pine or other soft wood, are also common. They are 3 to 8 feet long and 6 inches to 1 foot in diameter; in some cases they are wrapped with old rope, old fire hose, or the like. During the Spanish War the

desirability of coaling the United States ships at sea developed a special heavy class of fenders; the best of these were made of cotton bales, lashed with rope (which in some cases was covered with leather where likely to chafe) and supported from the deck by heavy rope slings. The large fenders now in use in the United States naval service are of somewhat similar size and shape, but are made of Spanish cane and are usually covered with a rope netting of very coarse mesh. These cane fenders are more resilient than the cotton bales, and are also much lighter and more easily handled, but they are not so durable.

FEN DISTRICT. See BEDFORD LEVEL.

FÉNELON, fā'n-lōn', FRANÇOIS DE SALIGNAC DE LA MOTHE (1651-1715). A distinguished French author and prelate. He was born Aug. 6, 1651, in the Château Fénelon, Province of Périgord, in the present Department of Dordogne. He was the descendant of a family which has given many celebrities both to the church and to the state in France. His education was conducted at home up to his twelfth year. At a very early age he showed lively interest in the classics and especially in Greek. At the age of 12 he was sent to the University of Cahors, noted at the time for its classical course. Thence he was transferred to the famous Jesuit College Du Plessis in Paris. His success in his studies was remarkable, and at the early age of 15 he attracted the attention of the literary coterie of the Hôtel Rambouillet. At the close of a brilliant college career, when scarcely 20 years of age, he entered the Seminary of Saint-Sulpice, which, under the Abbé Tronson, was worthily fulfilling the purposes of its great founder, Olier. In 1675, at the age of 24, Fénelon received holy orders. He wished to enter upon mission work in Canada and, when that was impossible, in Greece. For some time after his ordination he was employed in attendance at the hospitals and in other parochial duties of the parish of Saint-Sulpice. In the year 1678 he was made director of the *Nouvelles Catholiques*, a community of women founded for the purpose of furthering the conversion of girls from Protestantism. While thus occupied, he formed an intimacy with Bossuet and took part in conferences on Holy Scripture held under his auspices. Fénelon looked up to Bossuet almost as a master. At this time, at the request of the Duchess of Beauvilliers, he wrote his book *De l'éducation des filles*, which was intended only for private circulation. It attracted so much attention, however, that it was given to the public in 1681. (There are several English translations, e.g., "On the Education of a Daughter," Boston, 1856.) The book has been called an anticipatory condemnation of Rousseau's *Emile*. The efficiency with which he discharged his duties as director led to his appointment as head of a mission, which, on the revocation of the Edict of Nantes in 1685, was sent to preach among the Protestant population of Saintonge and Poitou. Here his zeal and wisdom accomplished much in converting the inhabitants. He refused to allow force to be employed wherever his authority extended. In 1688 he resumed his duties in the *Maison des Nouvelles Converties*, and in 1689 was named by Louis XIV to the highly responsible post of preceptor of his grandson, the young Duke of Burgundy. Bos-

suet said that the position was a proper reward for merit that took the greatest pains to conceal itself. In this position Fénelon showed himself a great practical educator. While imparting the most varied knowledge, he knew how to prepare the mind and heart of his pupil for the great responsibility that was to be his as the destined ruler of France. He impressed upon him the great principles of truth and justice and the vanity of earthly glory, power, and happiness that are not accompanied by a sense of duty well done. In order to fulfill these lofty purposes to his satisfaction, Fénelon found himself under the necessity of composing his own textbooks. To this we owe many works still popular in educational use—the *Fables*, the *Dialogues des morts*, *Abrégé des vies des anciens philosophes*, and the preliminary sketch, at least, of *Télémaque*. There was also a translation of the *Æneid* of Vergil, and a *Vie de Charlemagne*, but unfortunately the first is lost, and the manuscript of the second was destroyed by fire at the burning of the archiepiscopal palace of Cambrai in 1697. It was later charged that he had succeeded only too well, and made the Duke religious at the expense of manly vigor. In 1694 he was given the abbacy of Saint-Valéry in the diocese of Amiens and in the following year the archbishopric of Cambrai. He accepted the archbishopric only on the condition that he should be allowed to live at his see the nine months of each year required by the canons, and that not even his duties as preceptor royal should interfere with this requirement. During his preceptorship he became acquainted with Madame Guyon (q.v.), a pious widow who was wont to give spiritual conferences to ladies of rank and who had written a *Short and Easy Method of Prayer*, a commentary on certain parts of the Bible, and several other mystical works in which she expounded her views regarding the inner life. Not long before the writings of Miguel de Molinos, the founder of the Quietists, had been condemned as heretical. (See QUIETISM; MOLINOS.) Molinos taught that perfect contemplation of God is a state wherein one neither reasons nor reflects, but passively receives the impression of heavenly light. In this mental inaction a soul neither fears hell nor desires salvation. The practice of the virtues of faith, hope, and love becomes unnecessary in this state, which Molinos called "quiet." Madame Guyon was not a professed follower of Molinos, but she favored his spiritual doctrine at least to the extent of teaching that in the state of perfect contemplation the soul resigns itself so entirely to the will of God as to care not whether it is to be damned or saved. She professed readiness to submit to the decision of the church, but her teaching was regarded as dangerous. Bossuet, with characteristic acumen, recognized the danger, but, with what cannot but be considered now as intemperate zeal, harshly condemned where gentle persuasion might have sufficed. From this time on, Bossuet and Fénelon were antagonists. Fénelon, convinced of the uprightness of Madame Guyon and her good intentions, defended her. In a book written during the controversy, called *Maximes des saints*, he showed the influence of Madame Guyon's teaching. After considerable delay 23 propositions from the maxims were condemned by the Pope, who rebuked the lack of modera-

tion of some of Fénelon's opponents by adding, "He has erred through excess of Divine love, but you have erred through lack of love for your neighbor." Fénelon announced his condemnation to his own people at once and expressed his full submission. He seemed happy to give an example of docility and humility to his flock. Afterward he presented a golden ostensorium to his cathedral on which appeared the figure of the angel of Truth trampling on forbidden books. One of the titles in evidence was *Maximes des saints*. After this unfortunate episode Fénelon, who had been banished from the court, devoted himself entirely to the care of his diocese. The fame of his benevolence and enlightened charity spread far and wide. When the region about Cambrai was invaded by the armies of Marlborough and Prince Eugène, those commanders gave strict orders to respect the estates of Fénelon, and in a time of great scarcity Marlborough provided a guard to protect the Archbishop's granaries. Notwithstanding these precautions, his valuable library was burned. In it were some of his precious manuscripts not yet given to the printer. Fénelon's only remark was, "I would much rather that this were destroyed than the cottage of some poor peasant." Fénelon fell into disgrace at court by reason of his *Télémaque*, which was regarded as a masked satire upon the King and his policies. The work had been printed from a copy surreptitiously obtained by the Archbishop's servant. Critics freely pointed out the characters presumably satirized. Sesostris was supposed to represent the Grand Monarch himself; Calypso, Madame de Montespan; Proteslaus, Louvois; and Eucharis, Made-moiselle de Fontanges. As Louis XIV fell into decline, there were hopes that Fénelon would be the Minister of the Duke of Burgundy when he should follow his grandfather to the throne. Fénelon even sketched a complete scheme of political reform, which he sent to the Duke, who still retained, in spite of the King's adverse influence and continued hostility, all his pristine affection for his former preceptor. Fénelon's political maxims were far in advance of the time. These hopes were disappointed by the premature death of the Duke in 1712. Fénelon survived him only until Jan. 7, 1715, dying in sentiments of the greatest piety and resignation to the Divine Will. Consult his works (23 vols., Paris, 1820-30) and his letters (11 vols., ib., 1827-29); *Lettres et opuscules inédits* (ib., 1850); selections from his letters have been published in English (New York, 1906, 1910); Bausset, *Vie de Fénelon* (3 vols., Paris, 1808); Crauslé, *Fénelon et Bossuet* (ib., 1895), in favor of the latter; Sanders, *Fénelon: His Friends and his Enemies* (London, 1901); Vis-count Saint-Cyres, *François de Fénelon* (ib., 1901); Duclaux, *French Ideal: Pascal, Fénelon, and Other Essays* (New York, 1911).

FÉNELON, FRANÇOIS DE SALIGNAC DE LA MOTTE (1641-79). A French missionary in America, a half-brother of the great Fénelon. He entered the Order of Saint-Sulpice in 1664, and in 1666, when there came a request from Bishop Laval at Quebec for volunteer missionaries in the New World, Fénelon was one of the first to respond, and became an ardent and devoted missionary. In 1668 he established a Sulpician mission among the Cayugas on the Bay of Quinté on the north shore of Lake Ontario. On Easter Sunday, 1674, Fénelon preached

a sermon at Montreal in which, in describing the ideal chief magistrate, he made a covert attack on Frontenac. The Sulpicians disclaimed responsibility for the sermon, but, the question of the privileges of their order being raised they defended him. Fénelon was summoned to appear before the council at Quebec, which hesitated to act, but Fénelon returned to France and was commanded by the King not to return to Canada. Consult Parkman, *Count Frontenac and New France* (Boston, 1877).

FEN'ELON FALLS. A town of Victoria Co., Ontario, Canada, on the Grand Trunk Railway, 16 miles north of Lindsay, between Cameron and Sturgeon lakes (Map: Ontario, F 4). Its name is associated with a picturesque waterfall 20 feet high and 300 feet wide. The manufacturing industries include flour mills, a saw and shingle mill, planing mills, boat building, and a woolen mill. The town owns its electric-light and power plants. It is a summer resort. Pop., 1901, 1132; 1911, 1053.

FEN'ESTEL'LA (Lat., little window). A fossil polyzoan found in rocks of Ordovician to Permian age and especially abundant in those of the Devonian and Lower Carboniferous series. The fragile colonies formed by the animals are fan-shaped or funnel-form, and when examined with a lens are seen to consist of radial branches that diverge from a common rootstock and that bear on their inner surfaces the minute cells in which lived the individual animals. These radial branches are joined by frequent horizontal threads that give rigidity to the network. See POLYZOA.

FENESTELLA (c.51 B.C.-19 A.D.). A Roman historian. He wrote a work of 22 books, entitled *Annales*, from which Plutarch derived some material for his *Lives* of distinguished Romans, and which was used as an authority by Asconius Pedianus in his commentaries on Cicero's orations, as well as by Pliny the Elder, Gellius, and Lactantius. The few fragments preserved relate almost exclusively to events subsequent to the Carthaginian wars. It is certain that it included the greater part of Cicero's career. There was much information on antiquarian matters. The *De Sacerdotiis et Magistratibus Romanorum*, which was formerly attributed to Fenestella, was the work of Ptoecus, a Florentine who lived during the fourteenth century. The fragments of the *Annales* are collected in Peter's *Historicorum Romanorum Fragmenta* (Leipzig, 1883). Consult: Mercklin, *De Fenestella Historico et Poeta* (Dorpat, 1844); Poeth, *De Fenestella Historicorum Scriptore* (Bonn, 1849); Peter, *Historicorum Romanorum Reliquiae*, vol. ii (Leipzig, 1906).

FEN'ESTRA'TION. The arrangement, spacing, and proportioning of the windows, doors, and openings generally in the design of a building. The openings, of whatever character, are called the *voids*, as distinguished from the solids of walls and piers. Upon the fenestration depends in large measure the style and character of an architectural design, especially in its exterior aspect. In the warm southern climes the openings are relatively small and widely spaced; in cooler regions they are large and more closely spaced. Massive walls with infrequent openings produce an impression of dignity and solidity; greater richness is possible with larger openings and lighter masonry: compare the smiling palaces of Venice, with their

grouped windows, with the sober and austere Strozzi Palace at Florence. Certain styles employ particular types of fenestration, as is exemplified by the pointed-arched, traceried windows of the Gothic styles, the round-arched openings of the Romanesque, Roman, Byzantine, and Renaissance styles, the horseshoe arches of the Moorish styles, and the four-centred arches of Persia. The Roman and Renaissance styles also used the rectangular form, framed in an architrave (q.v.) and often capped with a cornice or pediment. In monumental design generally, the openings are superposed—"void over void, solid over solid"—and symmetrically spaced with reference to a central opening on the axis or median line of a façade; but in less formal and more picturesque design, as in country houses, this rule is not necessarily followed. See WINDOW; ARCHITECTURE.

FENGHUANG (fūng'hwāng') **CHENG.** A town of southern Manchuria about 45 miles northwest of Antung. Here the Japanese repulsed a Chinese assault Dec. 13-14, 1894. The town was occupied by the Japanese under Kuroki, May 6, 1904, in the pursuit of the Russians after the battle of the Yalu. See RUSSO-JAPANESE WAR.

FEN'IAN SOCIETY. A political association of Irish and Irish-Americans, the object of which was the emancipation of Ireland from British rule and the establishment of a republic. It has been said that the movement originated in America and was transplanted to Ireland; but, as a matter of fact, the plans for both the Irish and American organizations were drawn in Paris by a small group of the Irish revolutionary exiles of 1848.

The Irish Society was organized by the efforts of James Stephens, who in 1853 traveled through Ireland and organized the small centres of disaffection into a powerful conspiracy. It was necessarily secret, and known as the Irish Revolutionary Brotherhood (popularly called I. R. B.). Its aim was to convert the people of Ireland into a soldiery capable of resisting the British army. Stephens himself was the absolute military head, known as chief organizer (C. O.). He was assisted by four executive officers (one for each Irish province), known as "V's" (vice organizers) and chosen by himself. The "V's" selected "A's" (colonels), who in turn selected "B's" (captains) to choose and drill the "C's" (privates), who were all able-bodied men capable of bearing arms. The political programme of the Brotherhood contemplated the establishment of an independent republic based on universal suffrage and peasant proprietorship of the land. The possessions of hostile landlords were to be confiscated, and optional purchase was to be made at fair prices in other cases. Church property was to be confiscated, and the clergy were to be paid by the state. All religions were to be alike before the law.

The American society was organized at the same time by John O'Mahoney, according to the arrangements made in Paris, but did not obtain a really good footing until the arrival of Stephens in 1858. Its principal object was to supply money and arms to the Irish branch. In America the ability to bear arms was not a necessary qualification for membership. At the head was O'Mahoney, called the head centre, who appointed his own central treasurer,

assistant treasurer, and central secretaries. He also commissioned State centres, on the recommendation of delegates from circles. The State centres commissioned district centres, who in their turn organized circles (local associations). The membership dues were nominal, but the society received large sums as voluntary contributions. The Fenian convention, which met in Chicago in October, 1863, made the constitution of the society more democratic by making the office of head centre elective. The growth of the Fenian Society was very rapid. The American branch quickly spread into Canada, and the Irish branch into western England and Scotland. The funeral of Terence McManus, an exile of 1848, who died in San Francisco, gave occasion for demonstrations of mourning in America and Ireland which greatly increased the number of Fenians. Two newspapers, the *Phœnix* in New York and the *Irish People* in Dublin, were the official organs of the society. The effort of the Fenians to win over Irish soldiers in the British army is claimed to have been successful, but this is denied. Being a secret society in Ireland, it necessarily fell under the ban of the Catholic hierarchy, although the lower clergy sympathized with and in some cases participated in the movement. In America the clergy were divided in sentiment.

The Civil War in the United States gave the Fenians a great opportunity to obtain military training. A large part of the Irish soldiers engaged on both sides in the struggle were Fenians, and at the end of the war there was a formidable number of trained soldiers ready to fight for Ireland. It was believed in Irish circles that a definite understanding existed between the Federal government and the head centre to the effect that after the war in America was ended the Fenians should receive material assistance. When the American officers went to Ireland to assist in drilling and leading the expected recruits, they found the organization not sufficiently advanced for active military measures.

Meanwhile the British government had kept itself informed of the movement by the aid of informers and spies. In 1865-66 it suppressed the *Irish People*, suspended the habeas corpus act, and caused several leaders of the Brotherhood to be sentenced to terms of penal servitude. Stephens escaped from prison and fled to America, where he was joyfully received by the American branch and made head centre. But the failure of the rising in Ireland and the uncertain fate of the Irish-Americans who were confined in British prisons caused dissensions, and he was deposed. At a convention held in Cincinnati, in September, 1865, William R. Roberts was chosen to succeed Stephens, a constitution similar to that of the United States was adopted for the projected Irish Republic, and preparations were begun for the invasion of Canada. A proposed expedition of 10,000 men resulted in 500 men crossing the Canadian border from New York and Vermont in 1866. They defeated the Canadian militia, but had to return to the United States on account of the failure of the organization to provide them with reinforcements and supplies. Their leaders were arrested by the American authorities. A daring attempt to seize the arms and ammunition stored in Chester Castle and convey them by ship to Ireland was thwarted in 1867. The general uprising in Ireland which

was to follow the seizure was suppressed at every point. The rescue of two leaders by a band of Manchester Fenians resulted in the death of a police officer, for which three of the rescuers were hanged. The demolition of the wall of Clerkenwell prison and various Fenian threats threw the British authorities into a state of great alarm. Another attempt to raid Canada was suppressed by the United States government in 1871. This was the last effort of the Fenians.

The cause of the repeated failures of the Fenians is to be found in the fact that they had no real leaders. Stephens was a model organizer, but not a man of action. O'Mahoney was loyal to the order, but not a man of ability. There were endless dissensions among the leaders in both countries, besides much corruption, especially in the American branch. The dual organization in Ireland and America prevented harmony of action. But although they failed in their immediate object, their attempted uprising tended to convince English statesmen that it would be better to grant proposed reforms in Ireland than to be constantly engaged in suppressing revolts.

The name has been the subject of much discussion. O'Mahoney, who was a student of Old Irish lore, gave the name Fenian to the society. This name he derived from *Fionna Birinn*, an ancient military organization which existed in Ireland, taking its name from Finn, the celebrated hero of Irish legend. Officially the name "Fenian" applied to the American branch only, but in the mind of the public it became connected with the entire movement. At first the Irish branch was popularly known as the Phoenix Society, owing to the aid Stephens received from the Phoenix Club, especially in counties Kerry and Cork. This club was suppressed by the government in 1858. The real name of the Irish branch was, as before stated, the *Irish Revolutionary Brotherhood*. Consult J. Gibbons, *Proceedings of the First National Fenian Convention Held at Chicago, 1863* (Philadelphia, 1863), and *The Government Proceedings against Fenianism* (London, 1865). The most detailed account of the movement is J. Rutherford, *Secret History of the Fenian Conspiracy* (2 vols., London, 1877), partisan English; A. M. Sullivan, *New Ireland* (Philadelphia, 1878), chaps. xvii-xxv, is partisan Irish, as is J. Savage, *Fenian Martyrs and Heroes* (Boston, 1864), the author of which was himself a Fenian. A good brief account of the movement, Irish in sympathy, is to be found in Justin McCarthy, *Ireland since the Union* (London, 1877), chaps. xiv-xvii. Macdonald, *Troublous Times in Canada* (Toronto, 1910), is the best account of the Fenian operations against Canada.

FENIN, *fe-nân'*, PIERRE DE (?-1506). A French chronicler, born in Artois. His chronicle was for a long time attributed to his father, another Pierre, who died in 1433. It consists of an account of the rivalry between the Armagnacs and the Bourguignons, from the murder of the Duke of Orleans (1407) to 1427. The second part is not in the old editions. It describes the first five years of the reign of Charles VII. The best modern edition of the *Mémoires de Fenin* is that by Mademoiselle Dupont (1837).

FENN, GEORGE MANVILLE (1831-1909). An English journalist and author, born at West-

minster. He was early a contributor to *Chambers' Journal*, the *Star*, and *Once a Week*; became editor of *Cassell's Magazine* in 1870, and proprietor of *Once a Week* in 1873. He made himself known as the writer of a very extensive list of boys' stories, which have been circulated in many countries and have proved quite as popular in the United States as in England. Among these may be named: *Pia Bay'nets* (1899); *Charge: A Story of Briton and Boer* (1900); *Stan Lynn: A Boy's Adventures in China* (1902). In 1887 he produced a play, *The Barrister*, and in 1888 another, *The Balloon*. His publications include also several novels, such as *A Crimson Crime* (1899) and *The Cankerworm* (1901).

FENN, HARRY (1838-1911). An American illustrator and aquarellist, born in Richmond (Surrey). He removed to the United States in 1857, lived there continuously after the early eighties, and was one of the founders of the American Water Color Society, where he exhibited annually. He was an able draftsman and was the suggester and chief illustrator of the publication *Picturesque America* (1872-74), which was epoch-making in the history of black and white illustration. He also contributed to *Picturesque Europe*, *Picturesque Palestine*, and *Egypt and Sinai*; furnished the well-known illustrations for Whittier's *Snow-Bound*, and worked for the leading magazines, especially *Harper's* and the *Century*. His drawings are spirited, of exquisite finish, and reveal delicate qualities of perception and feeling for nature. He was a lecturer on Oriental subjects, and received a gold medal at the Chicago World's Fair in 1893.

FENN, WILLIAM WALLACE (1862-). An American theologian, born in Boston. He graduated from Harvard University in 1884 (A.M.; S.T.B., 1887), and, entering the ministry of the Unitarian church, he held pastorates in Pittsfield, Mass. (1887-91) and Chicago (1891-1901). He was also lecturer on biblical literature at the Meadville Theological School (1892-1901, 1905-07) and preacher to Harvard (1896-98, 1902-05), and he became professor of systematic theology in Harvard Divinity School (1901) and dean (1906). He is author of *Lessons on Luke* (1890); *Lessons on Acts* (1894); *The Flowering of the Hebrew Religion* (1894); *Lessons on Psalms* (1900).

FEN'NEC (from Ar. *fanaka*, to remain in a place), or **ZERDA**. The smallest of the canine tribe—a pretty little foxlike animal (*Canis*, or *Fennecus, zerda*) of the Sahara. It is about 15 inches long, besides the tail, which is nearly 7 inches in length and bushy like that of a fox. The general color is pale rufous cream, harmonizing with the desert sands; the breast, inside of the ears, and eyelids are white, and the tail is tipped with black. The erect ears are of enormous size—each as large as the face, giving a quaint air of intense alertness to the graceful little creature. It digs with remarkable speed a burrow in the sand, often escaping pursuit by fairly diving into the ground; and in its burrow, which is furnished with soft bedding and is remarkably clean, it sleeps most of the day, going abroad at dusk to steal cautiously to some drinking place and then to seek its prey, which consists of mice, small birds, lizards, insects, etc. The name is sometimes extended to related African species, such as Rüppell's fennec (*Canis famelicus*), the pale fox

(*Canis pallidus*), and the asse (*Canis chama*) of the Transvaal. See Plate of FOXES AND JACKALS.

FEN'NEL (AS. *fenol*, from Lat. *feniculum*, fennel, diminutive of *fœnum*, *fœnum*, hay), *Feniculum*. A genus of umbelliferous plants allied to dill (q.v.). The flowers are yellow. All the species are aromatic and have much-divided leaves with threadlike segments. The best known is common fennel (*Feniculum vulgare*), a native of the south of Europe. It is a biennial, 3 or 4 feet tall, cultivated in many gardens in both Europe and America, chiefly for the sake of its leaves, which are used for flavoring, but also for its aromatic seeds. Florence fennel, sweet fennel, Italian fennel, or Cretan fennel (*Feniculum dulce*) is of lower growth, much cultivated in the south of Europe. The enlarged bases of its leafstalks, after being bleached like celery, are boiled and served with drawn butter like cauliflower. The fruit (seed) is longer and paler than that of common fennel, has a more agreeable odor and flavor, is the favorite aromatic condiment of the Italians, and is used in medicine. Oil of fen-

FENNEL (*Feniculum vulgare*).

nel, an aromatic, stimulant, and carminative essential oil, is also made from it. Cape fennel (*Feniculum capense*, or *Carum capense*), found in the vicinity of the Cape of Good Hope, has a thick, aromatic esculent root. The Pan-muhoree of India (*Feniculum panmorium*) is a species of fennel much cultivated in its native country for its sweet, warm, and aromatic fruit, which is much used as a carminative and in curries. The "giant fennel" of the south of Europe is a plant of a different genus (*Ferula*) and abounds in a fetid juice. It is, indeed, closely allied to asafetida. The species mentioned above, except *Feniculum capense*, have recently been combined under the name *Feniculum vulgare*. The plant called "fennel flower" is *Nigella damascena*. Dog fennel is *Anthemus cotula* and *Eupatorium capillifolium*, both of which belong to the family *compositæ*.

FENNEL FLOWER. See NIGELLA.

FEN'NELL, JAMES (1766-1816). An English actor and writer, who went to America in 1793. He was born in London and was educated at Eton and Cambridge, but his extravagant habits ended his university career, and he undertook to support himself upon the stage. His first appearance was in Edinburgh, in 1787, as Othello, which remained a favorite rôle. In 1793 an invitation to play in Philadelphia brought him to the United States. For several years he acted successfully in the chief American cities, but his last years were spent in poverty and obscurity. Consult his *Apology for the Life of James Fennell* (Philadelphia, 1814).

FEN'OLLO'SA, ERNEST FRANCISCO (1853-1908). An American Orientalist and educator. He was born at Salem, Mass., and graduated from Harvard University in 1874. Removing to Japan in 1878, he was (between 1880 and 1886) professor of philosophy and political economy and of philosophy and logic in the University of Tokyo; became professor of aesthetics and manager of the Tokyo Fine Arts Academy; and for a time was Imperial fine-arts commissioner and manager of the Imperial Museum of Tokyo. He returned to the United States in 1890 and was for six years curator of the Oriental department of the Boston Museum of Fine Arts. In 1897 he accepted the professorship of English literature at the Imperial Normal School at Tokyo. In 1890 he was decorated by the Mikado with the third-class Rising Sun and with the third-class Sacred Mirror. He is author of *East and West: The Discovery of America and Other Poems* (1893); *An Outline History of the Ukiyos-ye* (1901); *Epochs of Chinese and Japanese Art* (2 vols., 1911; 2d ed., 1912).

FEN'RIR (Icelandic, probably connected with *fen*, quagmire, swamp, sea; cf. Eng., *fen*). In Norse mythology, the offspring of Loki (the evil genius) and Angurboda (anguish-boding), a giantess from Jötunheim. Loki had a legitimate wife, Sigyn; but by Angurboda he became the father of three monsters: (1) the wolf Fenrir; (2) the Midgard Serpent; (3) Hel, the Goddess of Death. Fenrir was bred among the gods, but only Tyr had the courage to give him food. When the gods saw how much he increased daily and remembered that the predictions were that he was destined to be their destruction, they endeavored to chain him. But he easily broke the first two chains. Then they made a third, Gleipnir, composed of the sound of a cat's footsteps, a woman's beard, the roots of a mountain, a fish's breath, and a bird's spittle. Fenrir suspected some trick in this, and was unwilling to be bound unless one of the gods should place his hand in the wolf's mouth as a pledge of good faith. Finally Tyr consented to do this, and the wolf in his vain struggles to break the chain bit off Tyr's hand. Fenrir could not break the magic chain and became a captive to the gods, who took him to the cave Gjöll and put a sword into his jaws. Out of these flows the river Von. Fenrir will remain in the cave until Ragnarök (the end of time) comes. He will then break loose, his upper jaw will touch heaven, his nether jaw the earth; fire will blaze from his eyes and nostrils. In the tremendous tumult which precedes the general dissolution the wolf will swallow Odin (father of gods) and so cause his death.

But at the moment will come Vidar, the silent god, who wears a wonderful shoe made from shoe parings since time began. With that shoe he will hold down Fenrir's lower jaw and with his hands tear off the upper jaw, and thus will the monster wolf be slain. According to Völuspá, from Fenrir are descended Skoll and Hati, the monsters that are to devour the sun and moon; elsewhere in the Edda Fenrir himself is spoken of as the devourer of the sun. See SCANDINAVIAN AND TEUTONIC MYTHOLOGY.

FEN'TON. See STROKE-UPON-TRENT.

FENTON, ELIJAH (1683-1730). An English poet, born at Shelton, Staffordshire. He studied at Jesus College, Cambridge, and became secretary to the Earl of Orrery in Flanders. Subsequently he was head master of the grammar school at Sevenoaks (Kent), instructor in literature to Craggs, the Secretary of State, and tutor to Lord Broghill, son of the Earl of Orrery. With Broome he assisted Pope in the latter's translation of the *Odyssey*, executing the first, fourth, nineteenth, and twentieth books in so clever an imitation of Pope's manner that his share cannot be distinguished by any internal test. He wrote a tragedy, *Mariamne*, presented in 1723, and published a collection of poems (1707), and editions of Milton, and of Edmund Waller (1729). Consult W. W. Lloyd, *Elijah Fenton; His Poetry and Friends* (1894).

FENTON, FERRAR (1832-). An English Orientalist, born in Waltham, Lincolnshire. He early became a proficient linguist and led a remarkable life, being at one time a factory operative and at another one of the originators of the De Beers Company, the South African Diamond Mines monopoly. Beginning with 1884, when he published *St. Paul's Epistles in Modern English*, he brought out from time to time versions of different parts of the Bible "in modern English."

FENTON, REUBEN EATON (1819-85). An American politician. He was born at Carroll, N. Y., studied law, was admitted to the bar in 1841, and practiced for a time at Jamestown, N. Y., but afterward gave up the profession of law and became a merchant. He was a Representative in Congress in 1853-55 and in 1857-65, and was then Governor of New York until 1860, serving two terms. During the Civil War he was a staunch supporter of the war measures of Lincoln and his cabinet. He was a United States Senator from 1869 to 1875 and in 1878 was chairman of the United States Commission at the International Monetary Conference at Paris.

FEN'UGREEK (AS. *fenogrecum*, from Lat. *fenum Græcum*, Greek hay), *Trigonella*. A genus of plants of the family Leguminosæ, allied to clover and melilot. The leaves have three obovate leaflets and scythe-shaped stipules. The flowers generally have the keel very small so that the wings and standard present the appearance of tripetalous corolla. The common fenugreek (*Trigonella fenum-græcum*) is an annual, native of eastern Europe and western Asia, naturalized in the Mediterranean region, where, as in India, it has long been cultivated as a fodder plant and for its strong-smelling, oily seed, which is used in Egypt and the East in bread and curry powder. In medicine it is now used only in external applications, but is employed in veterinary practice as an ingredient in condition powders. It is the

common flavoring substance of patent stock foods, which owe their strong, not unpleasant, odor to it.

FENWICK, GEORGE (c.1603-57). An English parliamentary leader and colonist in America. He studied law, was called to the bar at Gray's Inn in 1631, and became one of the patentees of the Connecticut Colony in 1635, visiting Boston in the following year. In 1639 he removed with his family to Saybrook, Conn., where he represented the patentees and held the office of Governor until 1644. In 1645 he disposed of most of his property at Saybrook and returned to England, where in the same year he was chosen to the Long Parliament from Morpeth. He served in the Civil War as a colonel of militia and became Governor of Berwick after its fall in 1648. He was one of the parliamentary commissioners for the King's trial, but did not act. He was with Cromwell in his invasion of Scotland in 1650 and, after serving as Governor of Edinburgh Castle, became in 1651 one of the commissioners for the government of Scotland. He was a member of the parliaments of 1654 and 1656 from Berwick.

FENWICK, or FENWICKE, JOHN (1618-84). An English Quaker colonist in New Jersey. Acting in conjunction with, or as a trustee for, Edward Byllynge (q.v.), he bought for £1000 the interest of Lord Berkeley in the Province of New Jersey, in March, 1673, and two years later led the company of Quakers which emigrated from England in the ship *Griffin* and founded Salem, N. J., the first English settlement in West Jersey. He and Byllynge soon became involved in a dispute over the extent of their respective shares in the purchase, but an adjustment was made by William Penn, who was called in as arbitrator, and who awarded one-tenth of the territory to Fenwick and the remainder to Byllynge. Fenwick, however, soon executed a contingent lease for 1000 years to John Eldridge and Edward Warner, and the property eventually passed out of his hands. After his arrival at Salem a controversy arose between him and Governor Andros of New York over the question of jurisdiction, and late in 1678 he was arrested, taken to New York, and forced to give his parole that he would not assume any authority on the east side of the Delaware River until regularly authorized to do so by Andros or the Duke of York. Consult *Narratives of Early Pennsylvania, West New Jersey, and Delaware*, ed. by A. C. Myers (New York, 1912).

FENWICK, SIR JOHN (c.1645-97). An English conspirator, the eldest son of Sir William Fenwick, of Wellington Castle. He served in the army and was advanced to the rank of major general in 1688. From 1677 to 1687 he served in Parliament. It was he who brought up the bill of attainder against the Duke of Monmouth in 1685. After the accession of William III, for whom he had a personal dislike—due, says Macaulay, to a reprimand from the Prince of Orange—he remained an ardent Jacobite and was involved in numerous plots against the King. He entered into the conspiracy known as the Assassination Plot (1695) and in the following year was arrested and committed to the Tower. His family connections and political backing might have brought him a pardon, had he not tried to implicate Marlborough, Godolphin, Shrewsbury, and

other Whig leaders. A bill of attainder was passed against him, with a very small margin of votes to spare. He was beheaded on Tower Hill on Jan. 28, 1697, being the last person executed in England in consequence of attainder.

FÉNYES, fá'nyësh, ALEXIUS (1807-76). A Hungarian geographer and statistician. He was born at Csokály (County of Bihar) and was educated at Grossvardein and Pressburg. After spending two years at Budapest and in European travel, he succeeded in collecting reliable data for his standard geographical and statistical works on Hungary. In 1835 he became permanently established at Budapest, where his principal works were written. These include a voluminous historical and geographical report on the contemporaneous conditions of Hungary (1836-30), for which work 200 ducats were awarded by the Learned Society of Hungary; *Magyarország Statistikája* (2d ed., 1844); and a school atlas of Hungary. In 1848 Fényes was appointed chief of statistics in the Ministry of the Interior.

FEODOR, fá'ô-dôr, FEODOROVITCH. See BERG, FRIEDRICH WILHELM REMBERT.

FEODOSIA. See KAFFA.

FEOFFMENT, fêf'ment (OF. *feoffement*, from *feoffer, fiefper, feffer*, to enfeoff, from *fief, fien, fen, fied, fec*, from ML. *feudum*, property held in fee, from OHG. *filu*, Ger. *Vieh*, AS. *feoh*, Goth. *failu*, cattle; connected with Lat. *pecus*, Skt. *pasu*, cattle). The oldest, and for a long period the only, method for the conveyance of freehold land known in England. It was a ceremonial mode of conveyance which rested upon and was derived from the primitive notion that an actual physical transfer of possession is essential to the transfer of title. It consisted in the formal conveyance of the land from the feoffor to the feoffee, the former stating distinctly the measure of the estate conferred, whether it was in fee, in tail, or for life. This conveyance of the land, in order to be complete, required to be accompanied by livery of seisin ("delivery of possession").

Livery of seisin was of two kinds—by deed and in law. In the former case, the parties being actually upon the land, the feoffor, usually by delivery of a twig or a turf, testified his conveyance of the land. In livery in law, the parties being in sight of the land, the feoffor, referring to the land, gave possession to the feoffee by indicating or describing the parcel to be conveyed. This mode of making livery was ineffectual unless the feoffee entered into possession during the life of the feoffor. Livery in deed might be effected by attorney, but livery in law only by the parties themselves. In the earliest times these ceremonies completed the conveyance. But by degrees the practice of embodying the transaction in a deed was introduced. When a deed was used, it was customary to indorse on the deed the fact that livery of seisin had been made. But it was still the livery and not the deed which effected the conveyance. By the Statute of Frauds (29 Car. II, c. 3) it was declared that no estate created by livery of seisin, unless accompanied by a writing signed by the party or his agent, should be of any effect, except as an estate at will, and by 8 and 9 Vict., c. 106, 3, a feoffment is void unless accompanied by deed.

The law formerly gave so great an effect to a feoffment that even when the party ostensibly making the conveyance was not lawfully

seised of the estate, the feoffment was sustained. This was called a tortious conveyance; the party in whose favor it was made was said to have acquired an estate by wrong, the rightful owner was disseised, and was left to his right of entry (q.v.). But by the statute last mentioned this tortious effect of a feoffment was destroyed. The practice of feoffment above described, and which has existed in England from time immemorial, differed materially from the old form of investiture in use in strictly feudal times and from that which still prevails in Scotland. In England the transaction was simply a conveyance by the actual holder of the land to a new tenant, attended by certain ceremonies, but requiring no confirmation by a third party to complete it. But by feudal usage every holder of land was the vassal of some superior lord, to whom he owed suit and service and without whose consent he could not part with his land; hence no conveyance was complete without the reception of a new tenant by the lord paramount as his vassal. In like manner, to this day, in Scotland, no transfer of a heritage is complete without formal confirmation by the superior; and although by recent legislation the old feudal usages have been abolished, yet the fact of acceptance by the superior, and the performance of the pecuniary services attendant on that acceptance, are still preserved. See CONVEYANCE; FER; FEUDALISM.

FERÆ (Lat. nom. pl., wild). In the Linnean system of zoölogy, an order of mammals including nearly all of the modern order Carnivora, plus several genera now ranked under the Insectivora and Marsupialia. In modern zoölogy the term is little used.

FERÆ NATURÆ (Lat., animals of "wild nature"). In law, animals of wild nature and habits, in contradistinction to domesticated animals. At common law, they are not the subjects of absolute property, and persons having them in possession are bound at their peril to keep them from doing harm. A qualified property in them may be gained by taming or confining them, or by reason of owning the land on which are their habitual resorts, or by reason of their inability to wander from such land, or by reason of an exclusive legal privilege of hunting, taking, and killing them. Even in such cases, if the animals escape from the possession of the qualified owner or from his land, and are thus at liberty in accordance with their wild nature and habits, the qualified property ceases, and any stranger may take them without incurring any liability to the possessor. In accordance with this doctrine it is held that, if a swarm of bees fly from the owner's land, they remain in his possession so long as he keeps them in sight and is able to possess them; but if they escape from his pursuit and light upon the land of another, the latter may hive and keep them. It is also held that a landowner has a qualified property in a swarm of wild bees in his woods, and a stranger can acquire no title to them by finding and taking them there without such owner's consent. Wild animals once in captivity do not regain their natural liberty so as to become subject to capture in case they have become so far domesticated as to have formed the habit of returning.

The liability of a person who has in his possession animals *feræ naturæ* is virtually that of an insurer of the safety of others against harm from such animals. It has been held, there-

fore, that one who keeps an elephant does so at his own risk, and an action can be maintained for an injury done by it, although the owner had no knowledge of its mischievous propensities. Consult: the *Commentaries* of Blackstone and Kent; also Darlington, *On Personal Property* (Philadelphia, 1891); Schouler, *Treatise on the Law of Personal Property* (3d ed., Boston, 1896).

FERAMORZ, fër'á-mörz. The young poet in Moore's *Lalla Rookh* (q.v.).

FÉRAUD-GIRAUD, fër'ó-zhè'rò', LOUIS JOSEPH DELPHIN (1819-). A French jurist, born at Marseilles. He studied at the University of Aix, and became a judge in that city in 1851. In 1878 he was appointed a councillor of the Court of Cassation. He published several legal works, including: *Servitudes de voirie* (1850-52); *Traité de la grande voirie et de la voirie urbaine* (1865); *Occupation militaire* (1881); *Code des mines et des mineurs* (1887); *Etats et souverains* (1895); *Traité des voies rurales publiques et privées et servitudes rurales de passage enclaves* (1896).

FER-DE-LANCE, fër'de-läns' (Fr., iron of the lance). A tropical American venomous snake (*Lachesis lanceolatus*) of extraordinary virulence. It is a pit viper, or crotalid, of the subfamily Lachesinæ, and hence closely related to the northern copperhead, the bushmaster (qq.v.), and others of South America and Indo-Malaysia. It resembles a rattlesnake, but has a tapering tail ending in a hard point (hence one name is "rat-tailed viper"), not rattle; reaches a length of 7 feet, and is reddish-yellow brown, marked with a black stripe from the eye to the neck, and irregular dark crossbands; sometimes the sides are bright red. It inhabits nearly all South and Central America and is everywhere dangerously abundant, being remarkable fecund. It is greatly dreaded, especially at night, when it wanders about. During the day it lies coiled in the fields and roadside herbage and, unlike almost all other snakes, will attack without warning or waiting for disturbance. Its bite is very likely to prove fatal, and even when the patient recovers it produces long-continued aftereffects. The snake is of service, on the other hand, in keeping down rats, etc., destructive to sugar cane. It is most conspicuous in the French Antilles, where alone it is known by this name. Its introduction to the islands of the mongoose (q.v.), in the hope that it might thus be exterminated, has proved useless. The best account of the fer-de-lance is that by Ruz, *Enquête sur le serpent de la Martinique* (Paris, 1859). Consult also Gadow, *Amphibia and Reptiles* (London, 1901), and Ditmars, *Reptiles of the World* (New York, 1910).

FERDINAND I (1503-64). Holy Roman Emperor from 1556 to 1564. He was born at Alcalá, Spain, March 10, 1503, and was the second son of Philip the Handsome of Austria and of Joanna the Mad (daughter of Ferdinand V of Aragon and Isabella of Castile and León), and was consequently the younger brother of Charles V of Germany (Charles I of Spain), who soon after his accession to the Imperial throne transferred the hereditary Austrian possessions of the Hapsburgs to Ferdinand. In 1521 he married Anna, sister of King Louis II of Hungary and Bohemia. When Louis fell at Mohács in 1526 in battle with the Turks, leaving no issue, the crown of Hungary was claimed by Ferdinand in right of his wife, and some of the

nobles chose him King. He was at the same time placed by election upon the Bohemian throne. In Hungary Ferdinand became involved in a long struggle with a rival, John Zápolya, the Voivode of Transylvania, who laid claim to Hungary, and who was supported by the Turks. The question was at last settled in 1538 by a division of the kingdom between the rivals, the title of King being given to Zápolya, but with the understanding that the Austrian line should have the succession to the whole. But in 1540, at the death of John Zápolya, the agreement was not kept, and the Turks carried on the war on behalf of his son Sigismund, while they themselves appropriated a large part of the kingdom. In 1547 peace was purchased by means of a yearly tribute to the Turks, but the war was again renewed in 1552 and ended in the retention of their conquests by the Turks. Meanwhile Ferdinand had acted as regent in Germany during the frequent absences of Charles V and in 1531 had been chosen King of the Romans. In 1552 he acted as mediator between Charles V and Maurice, Elector of Saxony, and concluded the Peace of Passau with the Protestants, and in 1555 he was chiefly instrumental in bringing about the religious Peace of Augsburg. In 1556, on the abdication of Charles V, Ferdinand mounted the Imperial throne. The concessions he had made to the Protestants caused Pope Paul IV to refuse to acknowledge him. His successor, Pius IV, was more complaisant; but the Electors resolved that for the future the consent of the Pope should not be asked; and this was carried out. Ferdinand made several attempts to reconcile the Protestants and Catholics and urged upon the Council of Trent the reformation of abuses. He effected institutional reforms, notably in connection with the Aulic Council (q.v.), and he reformed the German currency. He died in 1564, leaving the reputation of a prudent and enlightened ruler, and was succeeded by his son, Maximilian II. The most elaborate work on his reign is F. B. von Bucholtz, *Geschichte der Regierung Ferdinands I.* (Vienna, 1831-38). Consult also: K. Oberleitner, *Oesterreichs Finanzen und Heerwesen unter Ferdinand I.* (ib., 1859); A. Rezek, *Geschichte der Regierung Ferdinands I. in Böhmen* (Prague, 1878); Rosenthal, *Die Behördenorganisation Kaiser Ferdinands I.* (Vienna, 1887); W. Bauer, *Die Anfänge Ferdinands I.* (ib., 1907). See AUSTRIA-HUNGARY; GERMANY.

FERDINAND II (1578-1637). Holy Roman Emperor from 1619 to 1637. He was born at Gratz, July 9, 1578, and was the son of Charles, Duke of Styria, and grandson of the Emperor Ferdinand I. His mother, Mary of Bavaria, was a fervent Catholic, and from her, as well as from his Jesuit instructors at Ingolstadt, he imbibed that hatred of Protestantism which is the keynote to the policy of his reign. In 1590 he succeeded his father in the duchies of Styria, Carinthia, and Carniola. As soon as he was of age he proceeded to stamp out Protestantism in his dominions by annulling his father's act of toleration and expelling the Protestant pastors. He joined with Maximilian of Bavaria in forming the Catholic League, the ostensible object of which was the protection of the Roman Catholic interests in Germany. In 1617 Ferdinand was crowned King of Bohemia, while the Emperor Matthias was still reigning, and the year following he was crowned King of Hungary as well. The Protestants of Bohemia had enjoyed re-

ligious toleration since 1609, but Ferdinand, as regent of the kingdom, showed little regard for the rights of his heretical subjects. A dispute regarding the right of the Protestants to build new churches precipitated a conflict. All petitions to the Emperor proving vain, the Protestants under Count Thurn rose in Prague in May, 1618, invaded the council chamber of the castle, and threw two members of the Council of Regency, Martinitz and Slavata, out of a lofty window. They then organized a national government, and a Bohemian army under Count Thurn advanced to the Austrian frontier. This was the beginning of the Thirty Years' War (q.v.). The death of Matthias early in 1619 left the Imperial succession open to Ferdinand, but at this juncture he was besieged in Vienna by the victorious Thurn. The opportune victory of Bucquoi over Mansfeld and the approach of a force under Dampierre caused Thurn to withdraw, and Ferdinand was able to proceed to Frankfurt and receive the Imperial election, August, 1619. Two days before his election he had been deposed in Bohemia and the crown offered to Frederick V (q.v.), Elector Palatine of the Rhine. This prince, who was son-in-law to James I of England, accepted the dignity, but was ousted from his new dominions by the army of the Catholic League under Tilly, which won the battle of the White Mountain, near Prague, November, 1620.

As soon as his success in Bohemia was assured, Ferdinand proceeded to extirpate Protestantism in that kingdom by the most violent persecution. In Hungary, however, he was forced to grant religious toleration and to recognize Bethlen Gábor as ruler of half the kingdom. In 1626 Wallenstein took the field with a vast army which he had raised for the Emperor, whose main reliance in the war against the Protestants had hitherto been the army of the Catholic League, under Tilly, and the forces of Spain. In 1625 Christian IV of Denmark took up arms for the German Protestants. The victories of Wallenstein and Tilly made the Catholic cause for the King triumphant, and Denmark was forced to the Peace of Lübeck in 1629. This was followed by Ferdinand's Edict of Restitution, which was to apply to all ecclesiastical property which had become Protestant since the Peace of Passau (1552). But the plans of Ferdinand for reconverting the Empire to Roman Catholicism were suddenly checked by the irruption of Gustavus Adolphus, King of Sweden, in whom the Protestants found a deliverer. He landed in Germany in 1630, at the moment of the dismissal of Wallenstein through jealousy on the part of the Catholic League. Ferdinand had the mortification of seeing the whole of Germany overrun by the Protestants, and though Gustavus was slain at Lützen, in 1632, in a great battle against Wallenstein (who had been reinstated), the disasters to the Imperial cause continued. A blot on Ferdinand's character was the assassination of Wallenstein (q.v.) in 1634, to which there is little doubt the Emperor was privy. Though the Imperial army was victorious at Nördlingen in 1634, and the Elector of Saxony made peace with the Emperor, yet when Ferdinand died, Feb. 15, 1637, he left a heritage of war to his son, Ferdinand III, who had been chosen King of the Romans the year previous, and who had been previously crowned King of Hungary and Bohemia. Consult Hurter, *Geschichte Kaiser Ferdinands II. und seiner Eltern*

(Schaffhausen, 1857-64). See AUSTRIA-HUNGARY; GERMANY.

FERDINAND III (1608-57). Holy Roman Emperor from 1637 to 1657. He was the son of Ferdinand II and was born at Gratz, July 13, 1608. In 1625 he was crowned King of Hungary and in 1627 of Bohemia as well. After the death of Wallenstein (1634) Prince Ferdinand was placed in nominal command of the Imperial forces, and in the same year, seconded by Gallas, he gained a great victory at Nördlingen over the Swedes and their allies. In 1636 he was crowned King of the Romans and the next year succeeded his father as Emperor. Political reasons forced Ferdinand to continue the war, in which the French had become important factors, but in 1648, after negotiations extending over many years, the Peace of Westphalia (q.v.) put an end to the Thirty Years' War. In the Diet of that year, the last presided over by an emperor in person, Ferdinand effected important alterations in the administration of justice. He died April 2, 1657, shortly after concluding an alliance with Poland against Sweden. His son, Leopold I, succeeded him in the Empire as well as in the Austrian possessions and Hungary. Consult Koch, *Geschichte des deutschen Reichs unter Ferdinand III.* (Vienna, 1865-66). See AUSTRIA-HUNGARY; GERMANY; THIRTY YEARS' WAR.

FERDINAND I, surnamed THE JUST (1379-1410). King of Aragon from 1412 to 1416. He was the younger son of John I of Castile and Leonora of Aragon. On the death of his elder brother, Henry III, in 1406, he refused the crown of Castile, but undertook the office of regent during the minority of his nephew, John II. In this capacity he distinguished himself by his prudent administration of home affairs and by his victories over the Moors by land and sea. He took the title *de Antequera* on the surrender of that fortress after a siege of five months (1410). On the death of his maternal uncle, King Martin of Aragon and Sicily, in 1410, his claims to the throne, though not derived through the usual laws of descent, were taken up and keenly pressed by a powerful party in the state. The question of the succession was ultimately referred to a committee of nine judges, equally representing Catalonia, Valencia, and Aragon, and the result was his election by a majority in 1412. After he had defeated Count Jaime of Urgel, the last and most formidable of his rivals, he was formally crowned at Saragossa in 1414. He died April 2, 1416, at Igualada, and was succeeded by his son, Alfonso V. Consult Burke, *History of Spain*, vol. i (New York, 1904), and Altamira, *Historia de España*, vol. i (Barcelona, 1900).

FERDINAND II, King of Aragon. See FERDINAND V OF CASTILE.

FERDINAND I, *Ger. pron. fēr'dé-nānt* (1793-1875). Emperor of Austria from 1835 to 1848. He was the eldest son of Francis I by his marriage with Maria Theresa, of the house of Naples, and was born in Vienna, April 19, 1793. While Crown Prince, he traveled through the Italian provinces of Austria, Switzerland, and part of France, and showed great interest in the various branches of industry. In 1830 he was crowned King of Hungary, and in 1831 married Anna, the daughter of Victor Emmanuel I, King of Sardinia. An unsuccessful attempt to assassinate him was made by a Captain Reinol in 1832. In 1835 he succeeded

his father on the throne. It was expected that he would inaugurate a more liberal policy than that of his predecessors; but the absolutist principles triumphed, and Metternich was allowed to carry on the government. A council of state was formed, and reactionary measures continued. Industrial and commercial activity was encouraged, however, and the term of military service reduced from 14 to 8 years. In 1846 advantage was taken of the insurrection in Galicia to annex Cracow to Austria. In March, 1848, Vienna became the scene of a revolutionary outbreak (see AUSTRIA-HUNGARY), and the Emperor was forced to dismiss Metternich, who fled from Vienna, and to appoint a responsible ministry. Simultaneously a revolutionary movement at Pesth secured the appointment of a national Hungarian ministry. In May Ferdinand retired with his court to Innsbruck, but was induced to return to the capital in August, when the turmoil had subsided. But the October insurrection in Vienna made him again leave the palace of Schönbrunn and retire to Olmütz, where, on Dec. 2, 1848, he abdicated in favor of his nephew, Francis Joseph. He afterward resided at Prague, where he died June 29, 1875. Consult Stiles, *Austria in 1848-49* (New York, 1852), from Kossuth's point of view.

FERDINAND I, KING OF BULGARIA (1861-). He was born in Vienna, the youngest son of Prince Augustus of Saxe-Coburg and Princess Clementine of Bourbon-Orléans, a daughter of Louis Philippe. He received an excellent education and showed a marked aptitude for the study of natural history. The results of his botanical observations on a trip which he made to Brazil in 1879 were published at Vienna (1883-88). While serving in the Austrian army, he was offered in 1886 the vacant throne of Bulgaria, and on Aug. 14, 1887, took the oath to the constitution and the title of Prince. Although thoroughly acceptable to his subjects, he was not recognized by Turkey or the Great Powers until 1896. In 1893 he married Marie Louise of Bourbon, eldest daughter of Duke Robert of Parma, and the next year the Bulgarian Sobrane confirmed the title of Royal Highness to the Prince and his heir. Ferdinand continued to adhere to the Roman Catholic faith, but his son and heir, Prince Boris (born 1894), was received in 1896 into the Orthodox church. In 1908 Prince Ferdinand took as second wife Eleanor, a princess of the house of Reuss, and in the same year, taking account of the increased prosperity of his country and of the difficulties, foreign and domestic, which beset Turkey, he proclaimed the full independence of Bulgaria and assumed the title of King. His royal title was recognized by Turkey and the Powers in 1909. Ferdinand favored the formation of the Balkan League and the prosecution of the Balkan War (q.v.) of 1912-13. In the first period of that struggle the prowess of Bulgarian arms was such as to enhance the King's prestige, but the lamentable quarrel of Bulgaria with her former allies and the pitiable collapse of his country in the consequent second phase of the war discredited Ferdinand, both at home and abroad. Although by the final settlements of 1913 his kingdom had been materially enlarged by the incorporation of part of Thrace, including some 60 miles of seacoast on the Aegean, Ferdinand was deeply chagrined that a relatively larger territory had not been secured, and he even considered abdicating.

tion. Consult John Macdonald, *Czar Ferdinand and his People* (London, 1913). See BULGARIA, *History*.

FERDINAND I (?-1065). King of Castile and León, surnamed The Great. He was the second son of Sancho the Great of Navarre, and in 1033, when Sancho forced Bermudo III of León, the last direct descendant of Pelayo, in the male line, to surrender Castile, Ferdinand received that kingdom, together with Bermudo's sister Sancha in marriage. Bermudo, shortly after Sancho's death, sought to recover his lost possession but was defeated and slain (1037). Ferdinand, now King of León as well as of Castile, by a conciliatory though firm policy, established his authority over his conquered subjects, and when his domains were invaded by his brother, García IV of Navarre, the attack resulted in the death of the latter on the battlefield of Atapuerca, near Burgos, in 1054, and the annexation of a large portion of his dominions. At an early period of his reign Ferdinand began to direct his energies against the Moors and by a series of successful campaigns carried the Christian arms as far as the Mondego and reduced the emirs of Toledo, Saragossa, and Seville to subjection. He died at León, on Dec. 27, 1065, after having divided his dominions among his children. Ferdinand laid claim to the title of Emperor of Spain, a claim to which the Emperor Henry III of Germany objected, appealing in 1055 to Rome. According to a very doubtful tradition, a decision favorable to Ferdinand's Imperial pretensions, so far as they related to the territories which had been conquered from the Moors, was given, chiefly in consequence of the representations made by the famous Cid, Ruy Díaz de Bivar. Ferdinand effected many reforms, both in secular and ecclesiastical matters, and was very liberal to the church. Consult Burke, *History of Spain*, vol. i (New York, 1904), and Altamira, *Historia de España*, vol. i (Barcelona, 1900).

FERDINAND II (?-1188). King of León from 1167 to 1188. The death of his brother, Sancho III of Castile, in 1158, led to a military occupation of Castile by Ferdinand, professedly in the interests of his nephew, Alfonso III, but this occupation lasted only a short time. Meanwhile Ferdinand repudiated his wife, Doña Urraca, and became involved in a war with his father-in-law, Alfonso I of Portugal, which resulted in the defeat and capture of the latter at Badajoz, in 1169. He died in 1188 and was succeeded by his son, Alfonso IX. Consult Burke, *History of Spain*, vol. i (New York, 1904).

FERDINAND III (1199-1252). A king of Castile and León, usually known as St. Ferdinand. He was the son of Alfonso IX of León and of Berengaria, sister of Henry I of Castile. On the death of Henry, without issue, in 1217, Berengaria procured the proclamation of Ferdinand. In 1230, on the death of his father, he became King of León as well as Castile, thus finally uniting the two kingdoms under one crown. Following up the advantages which had been gained for the Christian arms by his father and the allied kings in the great battle at Las Navas de Tolosa, in 1212, he devoted all his energies to the prosecution of the Moorish War. Among his conquests may be mentioned those of Cordova in 1236, of Jaén in 1246, and of Seville in 1248. He was planning an invasion of Africa when he died, at Seville, leaving his

kingdom to his eldest son, Alfonso X. Though not canonized until 1668, he came to be popularly known as *el Santo* from a very early period, for his remarkable religious zeal. He laid the foundation of *Las Siete Partidas*, the legal code of Christian Spain, which was completed by Alfonso X (q.v.). Consult Altamira, *Historia de España*, vol. i (Barcelona, 1900), and Burke, *History of Spain*, vol. i (New York, 1904).

FERDINAND IV (1285-1312). King of Castile and León from 1295 to 1312. He was the son of Sancho IV. The early years of his reign were disturbed by a series of civil wars, but his mother, Queen Maria, succeeded in restoring order. After Ferdinand took the reins of government into his own hands, he proved himself entirely unfit to govern. The chief exploit of his reign, to which, however, Ferdinand contributed little, was the expedition against Algeciras in 1309, which resulted in the capture of Gibraltar. He died suddenly, Sept. 17, 1312. According to Mariana, he had condemned to death, unheard, two brothers of the name of Carvajal, and these, protesting their innocence, had summoned him to meet them within 30 days at the bar of God; hence the surname *el Enplazado*, "the Summoned." He was succeeded by his infant son, Alfonso XI. Consult Burke, *History of Spain*, vol. i (New York, 1904).

FERDINAND V, surnamed THE CATHOLIC (1452-1516). King of Spain; as King of Castile, Ferdinand V; as King of Aragon, Ferdinand II; as King of Naples, Ferdinand III. He was the son of John II, King of Aragon, and was born March 10, 1452. In 1469 he married, at Valladolid, Isabella, sister of Henry IV of Castile. On the death of Henry, in 1474, the Cortes proclaimed Isabella and her husband joint sovereigns of Castile and León. In 1479 Ferdinand became King of Aragon and Sicily, on the death of his father, and the two kingdoms of Aragon and Castile were united in the persons of Ferdinand and Isabella. Isabella, however, as long as she lived, maintained her position as Queen of Castile, and allowed her husband no other share in the government than the privilege of affixing his signature to the decrees and of uniting his arms with her own. Nevertheless, his influence in developing the Spanish monarchy was of capital importance. Ferdinand's reign was marked by uniform good fortune in his wars and his diplomacy. In Castile he distinguished himself by the effectual suppression of the banditti, who had become formidable in the confusion resulting from the civil wars. This he accomplished by reorganizing and putting in force against them the *Hermándad*, or Holy Brotherhood, a kind of national militia, representing all the cities of Spain. Not content, however, with taking strong measures against the Castilian outlaws, he also resolved to break the power of the feudal nobility and made good use of the *Hermándad* in carrying out this design. Cities and towns were encouraged to make themselves independent of the nobles, who were deprived of many important privileges. Among other humiliations they were subjected to the ordinary tribunals of justice. The reorganization of the Inquisition in 1478-80, although primarily and mainly intended to further religious ends, likewise helped to lessen their influence. Ferdinand also strengthened his power by vesting in himself and his successors the grandmastership of the military orders of Calatrava,

Alcántara, and Santiago. In all his schemes he was ably seconded by his Queen, Isabella, and by the celebrated Cardinal Ximenes. The year 1492 was the most brilliant in his reign and is one of the most important in the history of the material progress of the world. It was signalized by the discovery of America by Christopher Columbus, though the honor of having aided the great navigator belongs, not to Ferdinand, but to Isabella. The beginning of the same year witnessed the entry of Ferdinand and Isabella into Granada and the end of Moorish dominion in Spain. This event was immediately followed by the expulsion of the Jews from the Spanish dominions and from Sicily. This act of barbarity entailed the loss of a large and industrious body in the community. Ferdinand was as successful abroad as at home. He was victorious over Alfonso V, King of Portugal, while his general, Gonsalvo de Cordova, decided the contest for the possession of the Kingdom of Naples between France and Aragon in favor of the Spaniards in 1503. In the following year Isabella died, but Ferdinand regained power after 1506 as Regent of Castile for his daughter, Joanna the Mad (who had married Philip, son of the Emperor Maximilian), and her son Charles. In 1505 Ferdinand married Germaine de Foix, a niece of Louis XII of France. He took part in the famous League of Cambrai, formed against Venice in 1508, made himself master of various towns and fortresses in Africa, and in 1512 conquered the main portion of the Kingdom of Navarre, thus becoming monarch of Spain from the Pyrenees to the Rock of Gibraltar. He died at Madrigalejo, Jan. 23, 1516, and was succeeded by his grandson, Charles I (afterward Holy Roman Emperor as Charles V). To Ferdinand and Isabella Spain owes her unity and greatness as a nation. Consult Prescott, *Ferdinand and Isabella* (Philadelphia, 1900).

FERDINAND VI (1713-59). King of Spain from 1746 to 1759, called "The Sage." He was the second son of Philip V and Maria Louisa of Savoy. On succeeding to power he withdrew from European complications by concluding the Peace of Aix-la-Chapelle (1748), and devoted himself to internal reforms in his kingdom, aided by his two able ministers, Carvajal and Ensenada, and by his Irish adviser, Wall. Financial, agricultural, and commercial reforms took place, and the arts were encouraged by the foundation of the Royal Academy of San Fernando and by state support for the higher education of Spanish students. In 1753, by a concordat with Pope Benedict XIV, the right of presentation to Spanish benefices was confined to the King for all save 50 offices. In the Seven Years' War Ferdinand refused to join the French and the English and remained neutral. In 1758 the King, who had never enjoyed good health, broke down almost completely after the death of his consort, Maria of Portugal, and lost his reason. Under these circumstances a regency was formed. He died at the monastery of Villaviciosa, Aug. 10, 1759. As he left no heirs, the crown passed by an act of settlement to his half brother, Charles III. Consult Coxé, *Memoirs of the Kings of Spain of the House of Bourbon* (3 vols., London, 1815), and Villa, *Marqués de la Ensenada* (Madrid, 1878). For a circumstantial account of his last sickness and death, consult Conde de Fernán-Núñez, *Vida de Carlos III, publicada con la biografía del autor, apéndices y notas por A. Morel-Fatio y A. Pan y Méla*,

y un prólogo de D. Juan Valera (2 vols., Madrid, 1898, in "Libros de Antaño," vols. xiv, xv).

FERDINAND VII (1784-1833). King of Spain, 1808 and 1814 to 1833. He was the son of King Charles IV and was born at San Ildefonso, Oct. 14, 1784. In 1789 he was proclaimed Prince of Asturias, and his education was intrusted to the Duke of San Carlos and the Canon Escoiquiz. Encouraged by them, he placed himself in opposition to the powerful Spanish Minister, Manuel de Godoy (q.v.), who, after the death of Ferdinand's first wife, Marie Antoinette Thérèse of Naples, in 1806, sought to marry the young Prince to Marie Thérèse de Bourbon. Upon this Ferdinand took the advice of the French Ambassador, Beauharnais, and wrote to Napoleon asking for the hand of one of the Emperor's nieces. Spanish spies, acting on behalf of Godoy and the Queen, uncarthd this correspondence, and the Prince was arrested by order of Charles IV and confined in the Escorial in 1807. These events were followed by the French invasion of Spain, which so inflamed the people against Godoy and the King and Queen that they were forced to flee from Madrid. In March, 1808, following on the rising at Aranjuez, Charles IV abdicated in favor of Ferdinand, who was immediately proclaimed as Ferdinand VII amid great rejoicing. The French, under Murat, however, entered Madrid a few days later, and Charles IV, instigated by the French, withdrew his abdication, in a letter to Napoleon, on the ground that it had been extorted from him. The Emperor thereupon invited Ferdinand VII to a conference at Bayonne, and in spite of warnings the new King repaired thither, only to find himself a prisoner. The disorder in Madrid consequent on Murat's occupation was laid at Ferdinand's door, and after repeated negotiations and threats the Prince signed one paper renouncing the throne in favor of his father, and another by which he ceded to Napoleon all his rights of succession to the Spanish monarchy. In return he was to receive a pension of 800,000 francs and the château of Valençay. There he remained for the next six years, with his uncle, Don Antonio, and his brother, Don Carlos.

In 1813, after Wellington's victorious campaign in the Peninsula, Napoleon offered to reinstate Ferdinand on the Spanish throne. In March, 1814, the long-wished-for sovereign returned and was received with every demonstration of loyalty. All acts promulgated during his absence, including the constitution of 1812, were abrogated, and the old order of things restored. For six years Ferdinand sought to make himself absolute, and opposition was punished by banishment, imprisonment, and death; but insurrection succeeded insurrection, until in 1820 a serious mutiny took place among the Spanish troops, which was supported by the Cortes and the people, and Ferdinand was forced to confirm the constitution of 1812. But the struggle between the Constitutionalists and Royalists continued and finally ended in the triumph of the former (1822); thereupon the Holy Alliance sent a French army in 1823 to restore peace and absolutism, which, after an obstinate resistance on the part of the liberal element, succeeded. The Cortes, after the occupation of Madrid, retired to Cadiz, but were unable to hold the place against the invaders. Ferdinand returned in triumph to Madrid, and his first act was to annul all liberal measures passed since 1820 as

having been forced upon him. The Absolutist and Clerical party became practically supreme. In 1829 Ferdinand married his fourth wife, Maria Christina of Naples, and in 1830 abolished by a Pragmatic Sanction the Salic law as regarded female succession to the Spanish throne. This deprived his brother, Don Carlos, of the succession, by making the Infanta Isabella (born 1830) eligible to the throne, and led to the formation of the Carlist party in Spain. Through the influence of Calomarde (q.v.) Ferdinand was induced to revoke the Pragmatic Sanction of 1830, but soon after recalled his action and reaffirmed the succession of Isabella. In 1833 Isabella was proclaimed Princess of Asturias and heiress to the throne. Three months later (Sept. 29, 1833) Ferdinand died at Madrid, leaving his Queen, Maria Christina, regent. His reign was a most disastrous one for Spain, which lost almost all its possessions in North and South America and passed through vicissitudes and misfortunes that drained it of its best citizens and from which it has never recovered. Historians have not yet discovered any redeeming features in his character or his reign and his motives were consistently base. Consult: Scignobos, *Political History of Europe since 1814*, trans. by Macvane (New York, 1900); also *España del siglo XIX*, by various authors (Madrid, 1886-87); Baumgarten, *Geschichte Spaniens von 1789* (Leipzig, 1865-71). The Count of Casa Valencia published a diary that was kept by Ferdinand VII during the years 1820-23. Consult also: *Historia de la vida y reinado de Fernando VII de España, con documentos justificativos*, etc. (3 vols., Madrid, 1842); C. Le Brun, *Vida de Fernando Septimo, rey de España* (Philadelphia, 1826); M. A. S. Hume, *Modern Spain* (2d ed., London, 1906). See SPAIN.

FERDINAND I (1423-94). King of Naples from 1458 to 1494. He was an illegitimate son of Alfonso V of Aragon. He succeeded his father on the throne of Naples in 1458, but found an enemy in Pope Calixtus III, who favored John of Anjou. The latter invaded the kingdom and defeated Ferdinand. Pius II, the successor of Calixtus, supported him, however, and, with the assistance of Scanderbeg, the famous Albanian chief, John was defeated with great loss in August, 1462. In 1480 the Turks captured Otranto and slaughtered most of the inhabitants, but in the next year they were driven out. In 1485 a number of nobles revolted. Ferdinand held out the promise of a general amnesty if they would make submission and then treacherously murdered them. He died just as Charles VIII of France was about to invade his dominions. Though tyrannical, cruel, and treacherous, Ferdinand fostered industry and commerce and invited many humanists to his court, establishing a printing press at Naples in 1474. Consult Delaborde, *L'Expédition de Charles VIII en Italie* (Paris, 1888), and Sismondi, *History of the Italian Republics* (new ed., London, 1906).

FERDINAND II (1469-96). King of Naples from 1495 to 1496. He was the grandson of Ferdinand I, and son of Alfonso II, who abdicated in his favor in 1495. The kingdom was invaded by Charles VIII of France, and Ferdinand fled. He was able, however, with the aid of Gonsalvo de Cordova, the general of Ferdinand V, to regain his kingdom before his death. Consult Delaborde, *L'Expédition de Charles VIII en Italie* (Paris, 1888).

FERDINAND III. King of Naples. See FERDINAND V OF CASTILE.

FERDINAND I (1345-83), called "The Handsome." King of Portugal from 1367 to 1383, son of Pedro I. His reign was spent in fighting to obtain Castile for himself, and later for John of Lancaster, to the great loss of Portugal. Ferdinand died in 1383, and in 1385 an illegitimate son of Pedro I, John, founder of the dynasty of Aviz, was proclaimed King. Consult Stephens, *Portugal* (New York, 1891).

FERDINAND I (1751-1825). King of the Two Sicilies from 1759 to 1825. He was the third son of Charles III of Spain and was born at Naples, Jan. 12, 1751. When Charles ascended the Spanish throne, in 1759, Ferdinand succeeded him in Naples and Sicily under a regency of which the progressive Minister Tanucci was the head. Many reforms were inaugurated, and in 1767 the Jesuits were expelled from the kingdom. In 1768, after attaining his majority, the young King married Carolina Maria, a daughter of Maria Theresa of Austria, who was given a voice in the royal council after the birth of an heir and soon undermined the influence of Tanucci, who was dismissed in 1777. An Englishman, Sir John Acton, succeeded him in favor and became virtually Prime Minister. The Queen was cruel and dissolute and very much under the influence of Acton. It was at her instigation that Ferdinand was led to join England and Austria against France in 1793. He was glad to make peace with the Directory, however, in 1796. In 1798 he joined the secret alliance of Russia, Austria, and England, and his army occupied Rome. Ferdinand was no warrior and sadly lacked personal courage, for as soon as the French appeared and attacked his forces he fled to Naples and, embarking in an English man-of-war, escaped to Palermo. Naples was entered by the French, who, aided by a party of the nobles and citizens, established the short-lived Parthenopean Republic. The lower classes, who had fiercely opposed the French, were hostile to the new régime, and this, combined with reverses in northern Italy, led the French army to withdraw. The Republic collapsed before Cardinal Ruffo's Calabrian forces, and Ferdinand was restored. A reign of terror was immediately inaugurated, and the Republicans suffered greatly, but could do nothing in the presence of an English fleet under Nelson and a Royalist army. Relief came in 1801, when Ferdinand was forced to sign a treaty with France which included, besides various concessions, a general amnesty to political offenders and a clause allowing French troops to occupy his dominions. In 1805, at the instigation of Queen Caroline, he joined the Third Coalition and permitted 13,000 Russian and English troops to disembark at Naples. Napoleon won the victory of Austerlitz, and a French army forced the King and Queen of Naples to take refuge in Sicily. Naples was handed over to Joseph Bonaparte and later to Murat (1808), and it was not until 1815 that Ferdinand was restored. He had ruled over Sicily, however, under the title of Ferdinand III, until 1812, when he resigned his authority to his son Francis, under pressure from England, after granting the Sicilians a liberal constitution. After his restoration Ferdinand united the kingdoms of Sicily and Naples and assumed the title by which he is generally known—Ferdinand I, King of the Two Sicilies. Although he granted the Neapolitans a constitution as a

condition of his recall, he speedily abolished it when firmly established. By his declaration of May, 1815, he had proclaimed individual and civil freedom, security of property, access for all alike to all posts and judicial independence. At the same time he was negotiating a treaty with the Emperor of Austria for the maintenance of the evils of the old régime in Italy. His tyrannical policy brought on the revolution of 1820, and he was forced to relinquish his authority to his son, who was named Viceroy, and to swear to observe the liberties of the people. At the Congress of Laibach, in the following year, however, he succeeded in securing Austrian aid and entered Naples in triumph in 1821, with an Austrian force at his back. Aided by his unscrupulous Minister, Canosa, Ferdinand took a cruel vengeance on his subjects. The system of espionage and arrest was continued under Canosa's successor, Medici, becoming worse each day. Ferdinand died suddenly Jan. 4, 1825, and was succeeded by his son, Francis I. For a good account of Ferdinand's reign, consult: Colletta, *Storia del regno di Napoli dal 1734 al 1825* (Eng. trans., Edinburgh, 1858); Lanzilatti, *Memorie storiche di Ferdinando I* (Naples, 1827); Jeaffreson, *The Queen of Naples and Lord Nelson* (London, 1889); Probyn, *Italy, 1815-78* (ib., 1884); R. H. Johnston, *The Neapolitan Empire in Southern Italy* (2 vols., London and New York, 1904); G. Orloff, *Mémoires historiques, politiques et littéraires sur le Royaume de Naples* (5 vols., Paris, 1821); Pignatelli Strongoli, *Memorie intorno al Regno di Napoli dal 1805 al 1815* (Naples, 1820); A. Schipa, *Il Regno di Napoli sotto i Borboni* (ib., 1903).

FERDINAND II (1810-59). King of the Two Sicilies from 1830 to 1859, known as "King Bomba." He was the son of Francis I by his second wife, Isabella Maria of Spain, and was born Jan. 12, 1810. On succeeding his father, in 1830, he found the country in the most wretched condition. The beginning of his reign was marked by specious promises of reform in the economy and government of the country. But Ferdinand soon began to listen to Austrian counsels, which saw danger for the whole peninsula in liberal measures. From that time Naples became the scene of incessant conspiracy, revolution, bloodshed, and political prosecutions. The King was aided by his infamous Minister of Police, Delecarreto, and an elaborate system of espionage was established. The general discontent was greatly aggravated by this obnoxious policy. After insurrections had taken place in 1837, 1841, 1844, and 1847, Ferdinand was forced to yield to the storm of 1848 and granted a constitution to both parts of his dominions. After following the constitution so far as to call the chambers together, he quarreled with the deputies, and on March 13, 1849, dismissed them, impatient of any interference with his authority. An insurrection which had broken out in Sicily was put down by a ruthless bombardment of Messina, an incident which earned for the King the name of Bomba. After the subjugation of Sicily he hastened completely to set aside the new constitution, while all who had taken any part in the agitation for reform were subjected to cruel persecution. In 1851 there were 13,000 political prisoners confined at Naples. Both France and England made strong representations in 1856, but in vain. Several attempts to assassinate Ferdinand failed, but in 1858 he was

forced by Great Britain to liberate the political prisoners. Ferdinand died May 22, 1859, after terrible suffering, and was succeeded by his eldest son, Francis II. Consult: Nisco, *Ferdinando II ed il suo regno* (Naples, 1884); Dawburn, *Naples and King Ferdinand* (London, 1858); Thayer, *The Dawn of Italian Independence* (Boston, 1893); Stillman, *The Union of Italy* (Cambridge, 1898); Colletta, *Raccolta di documenti che servono ad illustrare i tre ultimi periodi rivoluzionari di Napoli 1799-1820-1848* (Naples, 1863-66); Probyn, *Italy, 1815 to 1878* (London, 1884); C. Livarotti, *Storia Critica del Risorgimento Italiano* (9 vols., Turin, 1888-97); Johnston, *The Neapolitan Empire in Southern Italy* (2 vols., London and New York, 1904); King, *A History of Italian Unity* (2 vols., London, 1899).

FERDINAND I (1549-1609). Grand Duke of Tuscany, fourth son of the first Cosimo de' Medici. He became Cardinal at the age of 14, and after the death of his brother, in 1587, succeeded to the rule of the grand duchy, being suspected of murdering his predecessor and Bianca Capello (q.v.). In 1589 he renounced the cardinalate and married Christine of Lorraine (died 1636), granddaughter of Catharine de' Medici. He favored the extension of commerce and of public works, continued the construction of the harbor of Leghorn, cultivated excellent relations with the other states of Italy, and permitted the Jewish refugees from Spain to settle in his realm. His numerous successful financial enterprises made him the leading capitalist of Europe.

FERDINAND II (1610-70). Grand Duke of Tuscany. He was a son of Cosimo II, whom he succeeded in 1621, becoming of age in 1628. He fell under the Spanish and Austrian influence of his mother, Maria Magdalena of Austria. In 1642-44 he formed an alliance with Venice, Parma, and Modena, against the Papal States, and conducted a disastrous war which imposed heavy obligations on the people.

FERDINAND III (1700-1824). Grand Duke of Tuscany and Archduke of Austria. He was the second son of the Emperor Leopold II and was born at Florence, May 6, 1709. In 1790 he succeeded his father in the government of Tuscany, when the latter became Emperor through the death of Joseph II. A lover of peaceful progress, he remained strictly neutral in the first coalition against France and was the first sovereign in Europe to recognize the French Republic, in 1792. In 1793, intimidated by the combined menaces of the Russian and British cabinets, the Grand Duke was constrained to relinquish his neutral policy and to become a passive member of the coalition against France. In 1795, on the French occupation of Piedmont, he speedily reassumed friendly relations with France. In 1797, in order to save his state from annexation to the Cisalpine Republic, he concluded a treaty with Bonaparte on the most unfavorable terms, undertaking to pay a war levy to France and to transfer to the Museum of Paris some of the chief masterpieces of the Florentine galleries. Owing to the continued intrigues of France in his state, Ferdinand was forced to seek an Austrian alliance, which furnished Bonaparte with a pretext for declaring war against Tuscany. In 1799 Ferdinand had to retire to Vienna, and in 1801, at the Peace of Lunéville, he was forced to renounce all claims on Tuscany, receiving the title of Elector and

the Principality of Salzburg (1803), which after the Peace of Pressburg, in 1805, he exchanged for the Duchy of Würzburg. He was one of the princes in the Confederation of the Rhine (q.v.), and in 1814 was reinstated in his Grand Duchy of Tuscany by the Peace of Paris. In coöperation with his Chief Minister, Fossombroni, he reformed the institutions of the grand duchy according to his policy of benevolent despotism. He tried to divert intellectual force from dangerous channels. The people in vain opposed the inefficient army and bureaucracy administered by the indolent Fossombroni. Ferdinand died June 7, 1824, leaving his state to his only son, Leopold II. Consult: Schopis de Salerno, *La domination française en Italie, 1800-1814* (Paris, 1861); Tivaroni, *L'Italia prima della rivoluzione francese, 1789-1815* (Turin, 1889); Thayer, *Dawn of Italian Independence* (Boston, 1893); Inghirami, *Storia della Toscana* (Fiesole, 1843); Reumont, *Storia della Toscana sotto la dinastia di Lorena-Absburgo* (Florence, 1877); Tivaroni, *Italia durante il dominio austriaco* (Milan, 1892-94).

FERDINAND IV (1835-1908). Grand Duke of Tuscany. He was born in Florence, a son of Leopold II and of Maria Antonia, daughter of Francis I, King of the Two Sicilies. After his father had renounced the throne (July 21, 1859), Ferdinand assumed the title of Grand Duke and on March 26, 1860, issued a protest against the incorporation of Tuscany with Sardinia. Most of the remainder of his life was spent in the Austrian castle of Salzburg.

FERDINAND (1577-1650). Duke of Bavaria and Elector of Cologne, son of William V, Duke of Bavaria. He was born at Arnsberg and was educated by the Jesuits at the University of Ingolstadt. After the death (1612) of his uncle Ernst, whose coadjutor he had become in 1595, he succeeded as Elector of Cologne and as Bishop of Liège, Münster, and Hildesheim, to which, in 1618, Paderborn was added. He was an enthusiastic disciple of the Jesuits and zealously strove to exterminate heresy. He carried on with some success the contest with the burghers of Liège.

FERDINAND (1721-92). Duke of Brunswick and Prussian field marshal, a son of Ferdinand Albert II (q.v.). He was born at Wolfenbüttel, one of a family of 14 children. After a journey through the Netherlands, France, Italy, and Austria, he entered the Prussian service in 1740 as colonel, served on the staff of Frederick the Great during the first Silesian War, and afterward remained the companion of the King. Subsequently appointed major general, he served as commander of the foot guards in the Silesian campaign of 1745, when he greatly distinguished himself at the battle of Hohenfriedberg. He was one of the most skillful commanders during the Seven Years' War, his most notable achievements being his victories over the French at Crefeld (1758) and Minden (1759). He was estranged from Frederick in 1766 and left the Prussian service. In the American Revolutionary War he was suggested for the post of commander of the British troops. Consult Von der Osten's edition of Ferdinand's *Tagebuch* (Hamburg, 1805), and the military biographies by Knesbeck (Hanover, 1857-58) and Westphalen (5 vols., Berlin, 1859-72).

FERDINAND (1816-85). Titular King of Portugal. He was born at Vienna, Oct. 29, 1816, the eldest son of Ferdinand, Duke of

Saxe-Coburg-Gotha. In 1836 he married Dona Maria la Gloria, Queen of Portugal. He received the title of King Consort the next year, and after the death of the Queen, in 1853, he acted as regent till 1855, during the minority of his son Pedro V. In spite of his foreign extraction Ferdinand was very popular in Portugal. In 1869 he was offered the Spanish crown by an influential delegation, but he refused, chiefly because he had made a love marriage with the celebrated American vocalist, Eliza Hensler, whom he created Countess of Elba, and whom he was unwilling to forsake. The rest of his life was spent in retirement. He devoted himself to painting and engraving with considerable success. He died in Lisbon, Dec. 15, 1885. Of the three sons of his first marriage, two, Pedro and Louis, became kings of Portugal. Consult Geldraye, *Résumé de l'histoire du Portugal au XIXème siècle* (Paris, 1875), also *Memoirs of the Duke of Saldanha* (London, 1880).

FERDINAND, *Ger. pron. fêr'dè-nünt*, VICTOR ALBERT MAINRAD (1865-1927). Prince of Rumania. He was born at Sigmaringen, Prussia, the second son of Prince Leopold of Hohenzollern, elder brother of King Charles I of Rumania. After his father and his elder brother had renounced their title to the crown (Nov. 22, 1888), he was declared heir presumptive. In 1889 he became Senator and on March 18, 1889, was formally invested with the title of Prince of Rumania and pronounced by the King and the Legislative Assembly the successor to the throne. On Jan. 10, 1893, he married Marie Alexandra Victoria, the eldest daughter of the Duke of Edinburgh. He succeeded to the throne Oct. 11, 1914, on the death of his uncle.

FERDINAND ALBERT II (1680-1735). Duke of Brunswick. He was a son of Ferdinand Albert I (1638-87), first Duke of Brunswick-Bevern. During the War of the Spanish Succession he fought with the Imperial army in Württemberg and Bavaria and in 1711 became lieutenant general. He fought in the Turkish wars in the army of Prince Eugène and distinguished himself at Temesvár and Belgrade. As field marshal of the Empire (1733), he conducted the army from Pilsen to the Rhine in 1734 and subsequently took part in the operations there. He became Duke of Brunswick-Wolfenbüttel March 1, 1735, the year of his death. He was a particular favorite with King Frederick William I of Prussia. His son Anton Ulrich was father of Ivan VI, Czar of Russia; and his eldest daughter married Frederick the Great.

FERDINAND AND ISABELLA, HISTORY OF THE REIGN OF. A work by William H. Prescott, published in 1837.

FERDINAND, COUNT FATHOM, THE ADVENTURES OF. The third of Smollett's novels (1753).

FERDINAND OF PORTUGAL (1402-43). A prince of Portugal called the "Holy Prince," the sixth son of King John I. He took part in the expedition against Tangiers, under the leadership of his brother Henry (1437). Upon its defeat Ferdinand was left as hostage in the hands of the Sultan of Fez for the city of Ceuta, which Henry had promised as ransom. King John and the Cortes refused to yield it, and Ferdinand dragged out a slavery of six years. His bones were brought back to Portugal and buried in Lisbon, at first in the convent of the Saviour and later in the convent of Batalha.

He was beatified in 1470, and the Bollandists have included his life in their great publication.

FERDINAND WILLIAM (1659-1701). Prince of Württemberg-Neustadt. He was educated in mathematics and military science and after serving in Denmark entered the Imperial army in 1683, and fought with distinction against the Turks and the French, being severely wounded at Neuhäusel in 1685. In 1690 he commanded the auxiliary Danish troops in William III's campaign against Ireland. In 1692 he led the same troops to Holland, where he distinguished himself in the conflicts with the French at Steenkerk and Neerwinden and became general of infantry. In 1698 he entered the service of King Augustus the Strong of Poland and defeated the Turks in the Ukraine, compelling them to cede to Poland a portion of Podolia. In 1700 he campaigned against Sweden in Holstein.

FERENTINO, fā-rēn-tē'nō. An episcopal city in the Province of Rome, Italy, 1450 feet above sea level, 50 miles southeast of Rome (Map: Italy, D 4). Enormous blocks of stone and a gateway on the west mark the course of the walls of the ancient Ferentinum, a town of the Hernici colonized by the Romans. The town markets wine and oil and has a seminary, a gymnasium, and a cathedral paved with ancient marbles and mosaics. Pop. (commune), 1901, 12,279; 1911, 12,928.

FERENTINUM. A city of the Hernici, in ancient Italy. See **FERENTINO**.

FERENTINUM. A city of the Etruscans, in ancient Italy. See **FERENTO**.

FERENTO, fā-rēn'tō. A ruined city in central Italy, 5 miles north of Viterbo. It is near the site of the ancient Ferentinum, originally an Etruscan city. Extensive Etruscan, Roman, and mediæval remains of walls, baths, and a huge theatre have been excavated.

FERGHANA, fēr-gā'nā. A province (*oblast*) of Russian Turkestan, Central Asia, situated between East (or Chinese) Turkestan, the Pamir, Bokhara, and the remainder of Russian Turkestan (Map: Asia, J 4). Its area is approximately 55,000 square miles. With the exception of the central portion, which forms the valley of the upper Sir-Daria, the surface of Ferghana consists both of mountains and steppes. The Alai and Trans-Alai mountains traverse it in the south. The larger part of the country is barren and unfit for cultivation. The climate is hot and the rainfall insufficient. The chief rivers are the Sir-Daria and the Kizil-Su. Lake Kara Kul is situated in Ferghana. The agricultural land is found mostly along the Sir-Daria, where cereals and fruit are raised to some extent. The cultivated area is about 3,000,000 acres, most of which is under constant irrigation. The silkworm industry, for which Ferghana was specially known, is no longer prosperous. The region is rich in minerals, including coal, lead, graphite, and petroleum. The manufacturing industries of Ferghana are of considerable importance, although most of them are carried on as house industries. The leading manufactures are leather, silk, rugs, paper, knives, and saddles. Cotton, raisins, dried fruits, and tobacco are exported. Imports consist of textiles, silk stuffs, copper goods, tea, sugar, and dyes. The trade is chiefly with Russia, Bokhara, and East Turkestan. The value of imports and exports aggregates about \$17,000,000 annually. The Transcaspiian and Orenburg-Tashkent rail-

ways cross portions of its area and have materially stimulated its commerce with Samarkand, Bokhara, and Tashkent.

The population in 1911 was officially estimated at 2,069,000, of whom the larger part were Sarts, and the rest Kirghizes, Tajiks, Russians, Jews, etc. The capital is New Marghelan, with a population of about 12,000. Old Marghelan has a population of 46,400; Khokam, 112,000. Ferghana constituted a part of the Sogdiana of the Greeks. It was invaded by the Arabs during the eighth century and was under the rule of the Samanids for two centuries thereafter. Conquered successively by a number of Oriental rulers, including Timur, the country obtained its independence at the end of the eighteenth century, when it was known as the Khanate of Kokand, or Khokand, the territory of the khanate being then much larger than the present territory of Ferghana. Internal dissensions gave the Russians an opportunity for interference, and in 1876 the khanate was annexed to Russia under the name of Ferghana.

FERGUS. A town of Wellington Co., Ontario, Canada, on Grand River, and at the junction of the Grand Trunk and Canadian Pacific railways, 13 miles northwest of Guelph (Map: Ontario, D 6). The manufactured products include farm accessories, lime, and building stone, and there are marble works and cereal and saw mills. Pop., 1901, 1306; 1911, 1534.

FERGUS FALLS. A city and the county seat of Otter Tail Co., Minn., 177 miles northwest of Minneapolis, on the Great Northern and the Northern Pacific railroads and on the Red River (Map: Minnesota, A 4). It is in the "park" region of the State, the centre of a productive agricultural district, and has abundant water power. The manufactures include flour, woolen goods, cement tile, undertakers' supplies, foundry and machine-shop products, sash and doors, brooms, beer, etc. The city contains a Carnegie library, two general hospitals, a State hospital for the insane, and the Park Region Lutheran and Northwestern colleges. Fergus Falls, chartered as a city in 1883, is governed under the charter of that date, which provides for a mayor, annually elected, and a city council. It owns the water works and electric-light plant. Pop., 1900, 6072; 1910, 6887.

FERGUSON, ADAM (1723-1816). A Scottish philosopher and historian. He was born at Logierait, Perthshire, where his father was parish minister; studied at the universities of St. Andrews and Edinburgh, and in 1745 was appointed chaplain to the Forty-third (afterward Forty-second) Regiment, in which capacity he was present at the battle of Fontenoy and is said to have charged the enemy sword in hand, among the foremost of the regiment. In 1757 he abandoned the clerical profession and succeeded David Hume as keeper of the Advocates' Library in Edinburgh. The same year he took a great interest in the success of the tragedy of *Douglas*, written by his friend John Hume, and wrote in its defense *The Morality of Stage Plays* (1757), which brought him into considerable notice. He was appointed professor in Edinburgh University, first of natural philosophy, in 1759, and subsequently (1764) of moral philosophy. The next year he published his *Essay on the History of Civil Society*. He then devoted some time to collecting material for a Roman history, but his work was interrupted by travel on the Continent with the young Earl of Chesterfield in

1774-76, and in 1778 by his duties as secretary to the commission sent out by Lord North to try to arrange the disputes between the North American Colonies and England. In 1783 appeared his chief work, *The History of the Progress and Termination of the Roman Republic* (3 vols.). It is a carefully written narrative of the history of the Roman people during 500 years. In 1785 ill health forced Ferguson to give up his professorship, and in 1792 he published his academic lectures under the title of *Principles of Moral and Political Science*. His *Institutes of Moral Philosophy* (1772) has been used as a textbook in several foreign universities. Consult the biographical sketch by John Small (1864).

FERGUSON, DONALD (1839-). A Canadian legislator and administrator. He was born at Marshfield, Prince Edward Island, was educated at the public schools, and early engaged in journalism in his native province. In 1878 he was elected a Conservative member of the Provincial Legislature, in which he retained a seat until 1891. Appointed (1878) Minister of Public Works, he subsequently became Provincial Secretary and Commissioner of Crown Lands, holding the two latter offices until his retirement from provincial politics. In 1893 he was appointed a Dominion senator. In the following year he became a minister without portfolio in the cabinet of Sir Mackenzie Bowell, and he held the same office in the succeeding cabinet of Sir Charles Tupper until the defeat of the Conservatives in 1896. He supported legislation to repress the liquor traffic.

FERGUSON, ELSTIE (LOUISE) (1883-). An American actress, born and educated in New York City. In 1907 she married Fred Hovey. She first played in *The Liberty Belles* in 1901 at Madison Square Garden, New York City, and subsequently appeared in *The Earl of Pavotucket* (1903), and in 1908 toured the United States in *Pierre of the Plains*, *The Battle*, and *The Traveling Salesman*. She starred in *Such a Little Queen* (1909), *Dolly Madison* (1911), *Primrose* (1912), *Rosedale and Arizona* (1913), and *The Unseen Empire* (1914).

FERGUSON, JAMES (1710-76). A Scottish astronomer, born near Keith, in Banffshire. Of humble origin, he enjoyed only three months of instruction at school, and his subsequent acquirements were the result of his own ardent desire for knowledge. After being employed in keeping sheep and drawing, he supported himself and his parents by making portraits, first in Edinburgh, and afterward (1743) in London, his leisure time being devoted to astronomical pursuits. In 1748 he began to deliver popular lectures on astronomy and mechanics with considerable success, a feature of his lectures being the remarkable apparatus of his own construction, which he used for purposes of illustration. He was elected a fellow of the Royal Society in 1763 and received from George III a pension of £50. He now gave up portrait painting and devoted himself to lecturing and writing on his favorite scientific subjects. Few men in Europe did more to promote a knowledge of the results of science among those who did not have the advantage of regular scientific training. His principal works are: *Astronomy Explained upon Sir Isaac Newton's Principles* (1756; Sir David Brewster's ed., 2 vols., 1811); *Lectures on Mechanics, Hydrostatics, Pneumatics, and Optics* (1760), also edited by Sir David Brewster in

1805; *Select Mechanical Exercises*, with an autobiography (1773). Consult Henderson, *Life of James Ferguson*, F.R.S. (London, 1867).

FERGUSON, JAMES (1797-1867). An American astronomer and civil engineer. He was born in Perthshire, Scotland, but in 1800 was brought by his father to New York. He was engaged, as assistant engineer, on the construction of the Erie Canal in 1817-19, was assistant surveyor in the boundary commission appointed in accordance with the Treaty of Ghent from 1819 to 1822, and was astronomical surveyor of this commission from 1822 to 1827. From 1833 to 1847 he was first assistant in the United States Coast Survey and from 1847 until his death was assistant astronomer of the United States Naval Observatory. He discovered several asteroids and was a frequent contributor to scientific and other magazines.

FERGUSON, JOHN CALVIN (1866-). An American in the service of the Chinese government. He was born in Ontario, Canada, and graduated from Boston University in 1886 (Ph.D., 1902). He was president of Nanking University from 1888 to 1897 and of Nanyang College (Shanghai) from 1897 to 1902. He served as adviser to the viceroys of Nanking (after 1898) and Wuchang (1900-10), and was secretary of the Chinese Ministry of Commerce (1902), the Imperial Chinese Railway Administration (1903-07), and the Ministry of Posts and Communications (after 1911). In addition, he was sent by the Chinese government on special missions to the United States in 1901, 1904, and 1907, was chairman of the Central China Famine Relief Committee in 1910-11, and proprietor of the *Shanghai Times* in 1907-11. He became a member of many foreign orders and societies and in 1911-12 was president of the North China branch of the Royal Asiatic Society, whose journal he had edited from 1902 to 1911.

FERGUSON, LOUIS ALOYSIUS (1867-). An American electrical engineer, born at Dorchester, Mass. After graduating from the Massachusetts Institute of Technology in 1888 he was employed by the Chicago Edison Company as engineer of the underground department, but was soon promoted, becoming electrical engineer of the company in 1890, general superintendent in 1897, and second vice president in 1902. He also served as general superintendent (1898-1902) and as second vice president (1902-07) of the Commonwealth Electric Company, to which he devoted his entire attention after 1907. In 1895 he became a staff lecturer at the University of Wisconsin. Ferguson contributed substantially to efficient central-station practice. He was president of the National Electric Light Association in 1902-03 and of the American Institute of Electric Engineers in 1908-09.

FERGUSON, MARGARET CLAY (1863-). An American botanist, born at Phelps, N. Y. She graduated (1890) from Cornell University, where she received the degree of Ph.D. in 1901. Previously she had been a teacher and a principal of public schools (1886-88), had had charge of science work at the Harcourt Place Seminary (Gambier, Ohio) (1892-93), and had been instructor in botany at Wellesley College (1894-96). Returning to Wellesley she became associate professor in 1904, professor in 1906, and head of the department of botany in 1904. She was assistant in 1901 and 1902 and instructor in 1903 in the Cornell Summer School. The American Association for the Advancement of Science

elected her a fellow. Her publications consist of papers on plant embryology and physiology and also *Contributions to the Knowledge of the Life History of Pinus with Special Reference to Sporogenesis, the Development of the Gametophytes and Fertilization* (1904).

FERGUSON, PATRICK (1744-80). A British soldier, inventor of the first practical breech-loading rifle. He was born in Scotland and was educated at a military academy in London. Before he was 15 years old he was appointed cornet in the Royal North British Dragoons, or Scots Greys, and served with them in the German campaign. The skill of the American marksmen during the first year of the Revolutionary War prompted him to devise several new forms of breech-loading firearms. In the first the breech was closed by a vertical screw plug, which was lowered to admit the introduction of the ball, followed by the cartridge or charge; in the second, the breech was closed by a perpendicular or horizontal turnplate; and in the third a sliding transverse bar was used. His own demonstrations of his rifle were singularly successful. He was ordered to America, where, early in 1777, he formed a corps of riflemen, consisting of volunteers from British regiments, armed them with breech-loading rifled carbines with screw-plug action, sighted for 100 to 300 yards. The corps distinguished itself at the battle of Brandywine (Sept. 11, 1777), but was afterward disbanded by Sir William Howe because he had not been previously consulted as to its formation. Ferguson played a conspicuous part in the war in the Carolinas, but was defeated and killed at King's Mountain, S. C. (Oct. 7, 1780).

FERGUSON, ROBERT (?-1714). A British political writer and pamphleteer, known as the "Plotter." He was born at Badfurrow, Aberdeenshire, Scotland, was probably educated at the University of Aberdeen, entered the ministry, and held a living at Godmersham, Kent, from which in 1662 he was expelled by the Act of Uniformity. The Shaftesbury party in 1680 sought and secured his services as a writer of political pamphlets attacking the government. He wrote pamphlets of remarkable ingenuity, attempting to prove the marriage of the King to Lucy Walters, the Duke of Monmouth's mother, and opposing the Exclusion Bill. He was implicated in 1683 in the Rye House Plot, although he asserted that he entered it in order to frustrate it. He saved himself by fleeing to Holland. He accompanied Monmouth as his secretary and chief adviser to the west of England in 1684, and after the battle of Sedgemoor, in 1685, escaped again to Holland. He accompanied William of Orange to England in 1688 and wrote various pamphlets in his behalf, but not receiving the recognition he had hoped for and being removed (1692) from the Exchequer, he suddenly became an ardent Jacobite and was in most of the plots during William's reign. He was several times arrested and imprisoned, but never brought to trial. Besides his religious and political pamphlets, he wrote: *A History of the Revolution* (1706); *Qualifications Requisite in a Minister of State* (1710); *The History of All the Mobs, Tumults, and Insurrections in Great Britain* (1715). Consult James Ferguson, *Ferguson the Plotter* (Edinburgh, 1887).

FERGUSON, SIR SAMUEL (1810-80). An Irish poet and antiquarian, born at Belfast. He studied at Belfast and afterward went to Trin-

ity College, Dublin, where he graduated in 1826. He practiced law for some time and was then made deputy keeper of the public records of Ireland (1867). For his services in this difficult position, which entailed much research, he was knighted in 1878. His poems and stories appeared constantly in the *Dublin University Magazine*, and he was also a contributor to *Blackwood's Magazine*. In 1882 he was elected president of the Royal Irish Academy. It is said that his imperfect knowledge of the Irish language interfered with an entirely faithful rendering by him of Gaelic myth and legend. Be this as it may, he holds an honored place among those who in English poetry have made the modern world acquainted with the strange beauty of the ancient Celtic imagination. His epic poem, *Congal*, in five books (1872), is probably his most important work; other volumes are *Lays of the Western Gael* (1865) and *Poems* (1880). *Tales from Blackwood* (1st series, vols. iii, vii, viii, and xii) contain several examples of his work. A collection of his stories and poems, including among the latter many early ones, was edited by Lady Ferguson and called *Hibernian Nights' Entertainments* (1887). He is now known to be the author of an extraordinary *jeu d'esprit* formerly attributed to William Maginn and entitled *Father Tom and the Pope* (1838), which admirably represents the Irish fancy in the full career of its wildest wit and drollery. He also wrote several antiquarian studies, of which the best known is *Ogham Inscriptions in Ireland, Wales, and Scotland*, ed. by Lady Ferguson (1887). Consult *Sir Samuel Ferguson in the Ireland of his Day* (2 vols., London, 1896), by his wife, Mary C. Ferguson.

FERGUSON, SAMUEL DAVID (1842-1916). An American negro bishop of the Protestant Episcopal church. He was born at Charleston, S. C., and emigrated (1848) with his parents to Liberia, Africa, where he was educated in mission schools. He became a teacher in 1862, and was ordained deacon in 1865 and priest in 1868. In 1884 the House of Bishops elected him missionary Bishop of Cape Palmas, and he was consecrated in Grace Church, New York, in the following year. He received the honorary degrees of D.D. from Kenyon College in 1885 and D.C.L. from Liberia College in 1893. Ferguson was the first African to become a bishop of the Protestant Episcopal Church of America.

FERGUSON, JAMES (1808-86). A Scottish architectural writer. He was born at Ayr and was educated at the high school in Edinburgh. He afterward entered the firm of Fairlie, Fergusson & Co., at Calcutta, India. Having made a fortune in the indigo trade, he retired from business and devoted himself to the study of archaeological and architectural subjects. In 1857 he was appointed a member of the Royal Commission to inquire into the defenses of the United Kingdom. He received a gold medal from the Royal Institute of British Architects in 1871 and was a vice president of the Royal Asiatic Society at the time of his death. Though he never practiced architecture, his advice was often sought by those in charge of the construction of public buildings. Ferguson was the first to show that architecture from the Renaissance to the present day consisted mainly of revivals and imitations of ancient styles, whereas that of the preceding ages was in general spontaneously evolved. His writings include: *Illustrations in the Rock-Cut Temples of India* (1845); *The*

Illustrated Handbook of Architecture (1855); *A History of Architecture in All Countries from the Earliest Times to the Present Day* (1867-76; 3d ed., 5 vols., 1891-99), which because of its comprehensive scope and suggestive criticism still ranks among the best in the field; *History of Indian and Eastern Architecture* (1876; new ed., 2 vols., 1910). Consult the brief biography in the *Architect*, vol. xxxv (1886).

FERGUSSON, ROBERT (1750-74). A Scottish poet. He was born in Edinburgh and was educated at the Dundee grammar school and at the University of St. Andrews. Giving up the church, for which he was at first intended, and refusing to study medicine, he returned to Edinburgh, where he found employment as a copyist in the office of the commissary clerk. This position he held, for the most part, till his death. In 1771 he contributed poems to *Ruddiman's Weekly Magazine*, and they gained him great local reputation. His society was eagerly sought, and in that convivial time he was led into excesses which impaired his health. He became melancholy and, from the effects of a fall, insane. His *Poems* were published in 1773. In 1789 Burns placed over his grave a memorial bearing a verse epitaph. Fergusson, a fluent and natural versifier in the Scottish dialect, was the forerunner of Burns. Consult: *Works*, edited with *Life*, and *Essay on Poetical Genius* by Grosart (Edinburgh, 1851); Ward, *English Poets*, vol. iii (New York, 1889); G. B. S. Douglas, *Scottish Poetry: Drummond of Hawthornden to Fergusson* (ib., 1911).

FERGUSSON, SIR WILLIAM (1808-77). A British surgeon. He was born at Prestonpans, Scotland, and was educated at Edinburgh. In 1831 he was elected surgeon of the Edinburgh Royal Dispensary, and after 1836 he served in the same capacity at the Royal Infirmary. He afterward successively became professor of surgery at King's College, London (1840-70), surgeon in ordinary to the Prince Consort (1840), and to the Queen (1867), president of the Royal College of Surgeons (1870), and clinical professor of surgery at King's College (1870-77). In 1866 he was created Baronet. He was for many years the leading operator in London and was the inventor of numerous ingenious surgical instruments, such as the "bulldog" forceps, vaginal speculum, and the mouth gag for cleft palate. He was especially successful with the operations for harelip and cleft palate and for the amputation of limbs. His principal works are *The Progress of Anatomy and Surgery in the Nineteenth Century* (1867) and a *System of Practical Surgery* (5th ed., 1870).

FERIÆ (Lat., holidays). Holidays in ancient Rome during which political and legal transactions were suspended and slaves enjoyed a cessation from labor. *Ferīæ* were thus *dies nefasti*, the opposite of the *dies fasti*. (See *FASTI*.) Days which were consecrated to a particular divinity, on which any public ceremony was celebrated, and the like, were *feriæ*. In contradistinction to these, which were *feriæ publicæ* (public holidays), there were *feriæ privātæ*, which were observed by single families, in commemoration of some particular occurrence of importance to them or their ancestors. Birthdays, days of purification after a funeral, etc., were also observed as family *feriæ*. The public *feriæ* were divided into those which were always kept (*statiuæ*) on certain days marked in the calendar, and those which were kept by com-

mand of the consuls or other superior magistrates on the occasion of any public emergency (*imperatiuæ*). There were 45 fixed holidays in ancient Rome and a large number of movable *feriæ*, the most important of which were the *feriæ latinæ*, the original common festival of the Latin tribes, held on the top of the Alban Mount, afterward carried to Rome along with the supremacy over Latium; the *feriæ sementivæ*, or sowers' festival, in the spring; and the *feriæ vindemiales*, or vintage festival, in the fall. Consult Fowler, *Roman Festivals* (London, 1899), and Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

FERISHTAH. See *FIRISHTAH*.

FERLAND, fâr'lân', JEAN BAPTISTE ANTOINE (1805-64). A Canadian clergyman, historian, and biographer. He was born in Montreal and was educated at Nicolet College, where (after being ordained to the priesthood of the Roman Catholic church, serving as vicar of Quebec, and filling several pastorates in his native province) he was appointed a professor (1841) and superior (1848). In 1834 he served as hospital chaplain at Quebec during the cholera outbreak, and in 1847 he distinguished himself by his courage during an epidemic of typhoid fever. He was attached to the cathedral at Quebec and was made a member of the Bishop's council (1850); was appointed professor of Canadian and American history in Laval University (1855), and became dean of the faculty of arts (1864). Ferland's work as a historian was remarkable no less for its lucid and charming style than for the patience, thoroughness, and impartiality with which original sources were explored and the inaccuracies and misrepresentations of former Canadian historians and biographers were corrected. In this respect he ably carried on the work initiated by F. X. Garneau. He published: *Observations sur une histoire du Canada par l'abbé Brasseur* (1853); *Notes sur les registres de Notre Dame de Québec* (1854); *Cours d'histoire du Canada* (vol. i, 1861; vol. ii, by Laverdière, 1865); *Journal d'un voyage sur les côtes de la Gaspésie* (1861); *Lettre sur la mission du Labrador* (1862); *Notice biographique sur Monseigneur Joseph Octave Plessis, Evêque de Québec* (1863); *Louis Olivier Gamache* (1863).

FERLAND, JOSEPH AUGÉ-ALBERT (1872-). A Canadian artist and poet. He was born in Montreal and after completing his early education studied art, history, literature, and theology. As an artist he produced a large number of historical portraits; but his poetical work is more important and has won distinguished recognition. He contributed frequently to *Les Soirées du Château de Ramessay*. He was also one of the founders of Ecole Littéraire of Montreal, an organization whose membership represents the new school of French-Canadian poetry. Ferland afterward became its president. In 1903 he was elected a corresponding member of the French Academy of Literature and Biography. He published *Mémoires poétiques* (1893), and *Femmes rêvées*, with preface by L. H. Frechette (1899). Consult Roy, "French-Canadian Literature," in *Canada and its Provinces*, vol. vi (22 vols., Toronto, 1913-14).

FERMANAGH, fêr-mân'â or *fêr-mâ'nâ* (named from the Irish clan *Fîr-Monach*, men of Monach). An inland county in the southwest of the Province of Ulster, Ireland (Map: Ireland, D 3). Area about 715 square miles. The most

important town in the county is Enniskillen (q.v.). There are pottery works at Belleek. The population, chiefly engaged in agriculture, shows a gradual decline since 1841, when it was 156,481. In 1851 it was 116,047; 1891, 74,170; 1901, 65,430; 1911, 61,836.

FERMAT, fâr'mâ', PIERRE DE (1601-65). A French mathematician, born at Beaumont-de-Lomagne, near Montauban. He was one of the most versatile mathematicians of his time and was unsurpassed as a contributor to the theory of numbers. Fermat was educated privately, was of a retiring disposition, and published little during his lifetime. At one time he turned his attention to law and in 1631 became counselor for the Parliament of Toulouse. The first edition of his works, gathered from his papers, annotations, and personal letters, was published in two volumes under the title *Opera Mathematica* (1670-79). Copies of this edition have become quite rare. The first volume contains the Arithmetic of Diophantus annotated, and the second, monographs on maxima and minima tangents, and centres of gravity, and copies of his correspondence with Huygens, Pascal, Descartes, and others. His chief contributions to the theory of numbers are found in his commentaries on Diophantus. Among them are such well-known propositions as follow: If a is prime to p , p being a prime number, then $a^{p-1} - 1$ is divisible by p , or, expressed in the notation of congruences (q.v.), $a^{p-1} - 1 \equiv 0 \pmod{p}$. A prime greater than 2 can be uniquely expressed as the difference of two squares. The expression $p^2 + q^2$, where p is prime to q , is not divisible by a prime of the form $4n - 1$. If p, q, r , are integers such that $p^2 + q^2 = r^2$, then pq cannot be a square. The equation $x^2 + 2 = y^2$ has a unique solution, and the equation $x^2 + 4 = y^2$ has two solutions. The equation $x^n + y^n = z^n$ has no integral root if n is integral and greater than 2. This proposition has never been proved, and a large prize is at the disposal of the University of Göttingen for the first proof that the mathematical world will accept as valid. In the case of particular curves Fermat obtained the maximum and minimum values of their functions; also the subtangents of the ellipse, cycloid, conchoid, and quadratrix. The methods employed so resembled those afterward developed through the differential calculus that some mathematicians, especially Laplace and Lagrange, have suggested Fermat as the inventor of the calculus. The rise of the theory of probability (see PROBABILITY) may be dated practically from the correspondence of Fermat and Pascal (1654). Fermat's answers to the problems suggested by Pascal reveal his firm grasp on the fundamental principles of probability. For further information concerning the life and work of Fermat, consult: Libri, *Journal des sçavants*, pp. 539-561 (1839); Brassinne, *Précis des œuvres mathématiques de Fermat* (Paris, 1853); Hoefel, in the *Nouvelle Biographie Universelle*, xvii, 438-451; Henry, "Recherches sur les manuscrits de Pierre de Fermat," in the *Boncompagni Bulletin*, vols. xii and xiii; Paul Tannery, "Sur la date des principales découvertes de Fermat," in the *Bulletin Darboux*, 2d series, vol. vii (1883); "Les manuscrits de Fermat," in the *Annales de la Faculté des lettres de Bordeaux*. The *Œuvres* of Fermat were republished by Tannery and Henry under the auspices of the Minister of Public Instruction (Paris, 1891-94).

FERMATA. fër-mil'tà (It., stopped). In Vol. VIII.—31

music, the name given to a pause or resting point, generally marked by the sign \frown . The notes over which this sign is placed are prolonged beyond their true length.

FERMENTATION (from Lat. *fermentare*, to ferment, from *fermentum*, yeast, from *fervere*, to boil). Fermentation as applied to certain lower forms of plants is the counterpart of respiration in the higher plants and various lower forms. The two processes are alike in that both are dissimilative; both are exothermic and release energy that is of physiological use in the organism, and so far as the mechanics of the processes have been worked out, both are carried on by the action of organic catalyzers, or enzymes (q.v.). Fermentation is generally distinguished from respiration by the facts that the oxidations or decompositions are less complete, involving, of course, a less copious release of energy, and that the particular organisms are more limited in the substances available for decomposition. These distinctions hold only in part, for while in respiration (q.v.) the carbon compounds are commonly oxidized to CO_2 and H_2O , sometimes the oxidations stop with organic acids or even ethyl alcohol as end products; many succulents in darkness oxidize the sugar mainly to malic, isomalic, or oxalic acid; *Aspergillus glaber* oxidizes a large part of the sugar to oxalic acid so long as the substratum is neutral or only slightly acid; and many flowering plants under limited oxygen supply produce organic acids as end products, while in total absence of oxygen they carry on alcoholic fermentation. On the other hand, many organisms that are considered as carrying on fermentations may dissimilate a great variety of materials, or even under proper conditions carry on "normal" respiration. This is especially true of yeasts. The marked similarity and lack of definite points of distinction between fermentation and respiration have led some authors to treat both processes under respiration.

Besides furnishing energy to the organism, fermentations apparently often have significance in producing materials in the substratum that kill competing organisms of other species. *Aspergillus* does this by excreting oxalic acid, yeast by producing ethyl alcohol, and *Citromyces* by forming citric acid. In the first case the organism ceases the excretion before the acid reaches a concentration injurious to itself. In the other two there is said to be no such regulatory formation, at least in cultural conditions.

Fermentations are often named from the principal products, e.g., alcoholic, lactic, butyric, acetic, etc. On the other hand, there are cases where they are named from the substance fermented, as is the case with cellulose fermentation. The greatest variety of substances are fermented: proteins, cellulose, pectins, sugars, alcohols, acids, paraffins, and a variety of inorganic materials such as ammonia, hydrogen sulphide, hydrogen, and carbon monoxide. In fact, any reduced substance that results from various physiological processes seems to be available to one organism or another as a source of energy through oxidation or splitting. The end products of one fermentation or another are no less numerous: alcohols, acids, methane, hydrogen, hydrogen sulphide, carbon monoxide, amino acids, ammonia, etc. Some of the most active fermentations are produced by the simpler organisms, the bacteria (q.v.) and the lower forms of fungi (q.v.), especially the yeasts and mucors.

The fermenting power of these organisms is so conspicuous that they were formerly called "organized ferments" to distinguish them from enzymes. But in these forms, as in higher plants, the processes are probably carried on by enzymes. Some of the ferment organisms are adapted to live wholly without oxygen for respiration, securing the necessary energy by fermenting the medium in which they live; such, e.g., are the butyric ferments (*Bacillus amylobacter*). Others are able to utilize free oxygen during periods of sluggish fermentation or to do without it temporarily or for a considerable period by setting up active fermentation; such are the yeasts.

Fermentations may be grouped as (1) splitting; (2) oxidative; (3) compound.

(1) Splitting fermentations are most common; they consist in the separation of the fermentable substance into two or more products. The best known of these is the alcoholic fermentation of sugar, produced chiefly by yeasts (*Saccharomyces*) and mucors. In this process, which is employed commercially on a large scale in the manufacture of beer, wine, and spirits, and in the making of bread, most of the sugar (95 per cent) is split up into alcohol and carbon dioxide thus: $C_6H_{12}O_6 = 2C_2H_5OH + 2CO_2$. The other 5 per cent is used as building material, normally respired or fermented otherwise. It has been recently shown that this action is due to zymase, an enzyme formed by the yeast, in which several others had previously been found. Only sugars, the number of carbon atoms in whose molecules is 3 or a multiple of 3, can be fermented in this way. Of the hexoses d glucose, d mannose, d galactose, and d fructose are fermentable. Cane sugar, a disaccharide, is first broken up by invertase into glucose and fructose, which are then fermented. Different yeasts attack the sugars differently; some ferment maltose and not saccharose; some ferment fructose better than glucose, others act on it less readily. Alcoholic fermentation is stopped by the accumulation of alcohol in the fluid beyond 10-19 per cent in the different yeasts. Lactic-acid fermentation is well known from causing the "souring" of milk and fruit juices. Lactic-acid bacteria (especially the *Bacterium acidilactici*) are the agents. They attack the glucose directly, and the saccharose and lactose after "inversion," converting the former into glucose and fructose and the latter into glucose and galactose. About 83 per cent of the sugar is converted into lactic acid; the rest is transformed into various by-products. The presence of 8 per cent, or even less, of free acid stops the fermentation. Butyric fermentation is responsible for the aroma of butter. The products (among which are butyric acid) are numerous and diverse; the process is complex and varied in its details. The fermentation of cellulose is of great cosmic significance in avoiding the too great accumulation of carbon in a form unusable by most organisms. One cellulose fermenting organism produces acetic and butyric acid in abundance, other organic acids in traces, also carbon monoxide and hydrogen. A second sort produces similar products with methane instead of hydrogen. Both these forms are anaerobic. Other organisms also take part in this important process. Pectic materials, another important constituent of cell walls, is also fermented by various organisms.

(2) Oxidative fermentations cause the formation of new compounds by oxidation of the old.

The most important case is presented by the transformation of ordinary alcohol into vinegar. In making malt vinegar dilute alcohol is allowed to trickle slowly over beech shavings slimy with the acetic organisms *Bacterium aceti*. By the time the liquid reaches the bottom of the cask, the alcohol has become converted into acetic acid. The oxidation takes place according to the following chemical equation:

Some of the acetic-acid organisms can attack a great variety of substances. In absence of alcohol the acetic acid may be oxidized to carbon dioxide and water. The various fatty acids are oxidized to their corresponding alcohols. Sugar, mannitol, and other substances can be normally respired. It is probably correct to place in this group the nitrite and nitrate organisms of the soil which oxidize ammonia first to nitrites and then to nitrates, and the sulphur bacteria which oxidize hydrogen sulphide of putrid streams to sulphuric acid. The action of these organisms is of great importance in the nitrogen and sulphur cycles.

(3) Compound fermentations are combinations of splitting and oxidative fermentations. They include mainly putrefactions, the chemical changes of which are little known. The products are numerous and often ill-smelling. See ENZYMES; DIGESTION, ORGANS OF; RESPIRATION, ORGANS OF; VINEGAR; ALCOHOL; BEER; BREWING; DISTILLED LIQUORS.

FERMENTED AND DISTILLED LIQUORS. See DISTILLED LIQUORS; LIQUORS, FERMENTED AND DISTILLED.

FERMO, fĕr'mô. A city in the Province of Ascoli Piceno, Italy, 1020 feet above sea level, 4 miles from the Adriatic, of which it has a splendid view, and 37 miles south of Ancona (Map: Italy, D 3). Its small harbor is known as Porto san Giorgio. It is the seat of an archbishop, and its cathedral rests on the foundations of a famous temple of Juno; at the main gate are the ruins of the immense ancient wall; and in the city hall, part of which dates from the fourteenth century, are Roman antiquities and inscriptions. Fermo has a lyceum, a gymnasium, an industrial and a convict school, a theatre, and a public library, is lighted by electricity, and ships large quantities of grain, silk, and wool. Breeding silkworms is an important industry. Its name comes from that of the ancient Firmum Picenum, whose ruins are in the vicinity. Pop. (commune), 1901, 20,542; 1911, 22,570.

FEB/MOR, ARABELLA. The daughter of James Fermor of Tusmore, the theft of whose curl by Lord Petre inspired Pope's "Rape of the Lock." She died in 1738.

FERMOR, fĕr'môr, WILLIAM, COUNT (1704-71). A Russian soldier, born at Pskov, in the government of that name. He was commissioned lieutenant general in 1746 and in 1758 was placed in command of the Russian army in the war against Frederick the Great, when he took Königsberg and all of eastern Prussia. On August 25 of that year, however, he was defeated by Frederick at Zorndorf, and in 1759 he relinquished the command to General Soltikov. Subsequently, under Catharine II, he was for a time Governor of Smolensk.

FERMOY, fĕr-moi'. A town in the east of County Cork, Ireland, on both banks of the Blackwater, 19 miles northeast of Cork (Map: Ireland, C 7). The hills to the south of the

town reach an altitude of 1388 feet in Knockinskeagh. Fermoy is an important garrison town with barrack accommodation for 3000 troops. It is the seat of an extensive Roman Catholic establishment, comprising a cathedral, episcopal palace, two convents, and a college (St. Colman's). Agricultural products and grist mills constitute the principal industries. Fermoy dates from the foundation of a Cistercian abbey in the twelfth century; its modern importance is due to the enterprise of Sir John Anderson, who built the barracks, platted the town, and established a mail-coach service throughout Munster at the beginning of the nineteenth century. Pop., 1901, 10,518; 1911, 11,226.

FERN (AS. *fearn*, OHG. *farn*, Ger. *Farn*; probably connected with Skt. *parṇa*, feather, leaf, and with Russ. *paproti*, Ir. *raith*, fern). A plant of the order Filicales, one of the great living groups of Pteridophytes. The group contains about 4000 of the 4500 species belonging to the Pteridophytes and therefore is usually considered to be the representative group. Although known in considerable numbers in the temperate regions, its chief display is in the tropics, where ferns form a striking and characteristic feature of the vegetation. In habit ferns vary from those with delicate and filmy mosslike leaves to treelike forms, rising to a height of 35 to 45 feet and crowned by a rosette of leaves 15 to 20 feet long. The various species of ferns are prevaillingly terrestrial plants, but some of them are aquatic, even floating; while there are numerous forms, especially in the tropics, which are epiphytic, i.e., they perch upon other plants. The Filicales differ from the other groups of Pteridophytes chiefly in having a few large leaves which do both foliage work and spore bearing. The alternation of generations (q.v.) is very distinct, the sexual plant (gametophyte) being represented by the prothallium, and the sexless plant (sporophyte) by the leafy plant. The prothallium is like a small liverwort, with a dorsiventral body, and numerous rhizoids extending from its undersurface. It is so thin that all of the cells contain chlorophyll, and it is usually short-lived. The antheridia (male organs) and archegonia (female organs) are usually developed on the undersurface of the prothallium and differ from those of the mosses in that they are sunken in the tissue of the prothallium and open on the surface, more or less of the neck of the archegonium projecting. The eggs are not different from those formed within the archegonia of mosses, but the sperms are very different. The fern sperm is a long spirally coiled body, blunt behind, and tapering to a long beak in front, which bears numerous retrorse cilia.

The sexless, leafy plant consists in the main of a subterranean dorsiventral stem, which gives out secondary roots from beneath and sends up characteristic aerial leaves which have long been called "fronds." The leaves are recognized not merely by their ordinary habit of branching, but better by their venation, which is forking or dichotomous (q.v.), and by their venation, which is coiled or circinate. The spore vessels (sporangia) are borne for the most part on the undersurface of the foliage leaves, usually closely associated with the veins, and organized into groups of definite form known as "sori." The sorus may be round or elongated and is usually covered by a delicate flap known as the "indusium" (q.v.), which arises from the epidermis.

Occasionally the sori are extended along the undersurface of the margins of the leaf, as in the maidenhair fern and common brake, in which case they are protected by the inrolled margin. While in most cases the leaves doing foliage work also produce sporangia, there are some forms in which the two kinds of work are separated, certain leaves doing only foliage work and others producing spores, the latter being called sporophylls, as in the ostrich fern (*Struthiopteris*), the climbing fern (*Lygodium*), the royal fern (*Osmunda*), etc. An ordinary fern sporangium (spore vessel) consists of a slender stalk bearing a spore case. This case has a delicate wall formed of a single layer of cells, and extending vertically almost around it from the stalk, like a meridian about a globe, is a row of peculiar cells with thick walls, forming the heavy ring called the "annulus." The annulus is like a bent spring, and when the delicate portion of the case wall yields the spring straightens violently, the case wall is torn, and in the rebound the spores are discharged with considerable force.

The true ferns are often divided into two great groups on the basis of the origin of their sporangia. In one case the sporangium is purely an external structure, being derived from a single epidermal cell, and such ferns are said to be "leptosporangiate." In other ferns the sporangium involves the deeper structures as well and is really an internally developed organ; such ferns are "eusporangiate." The eusporangiate ferns are the more primitive forms and probably were the prevailing kind during the Carboniferous period. The living families are Marattiaceae ("ringless ferns") and Ophioglossaceae ("adder's-tongues" and moonworts). The leptosporangiate ferns are the modern and abundant forms. There are two great divisions of Filicales, viz., the "true ferns" (Filicineae) and the "water ferns" (Hydropteridineae). Among the Filicineae six great families are ordinarily recognized, as follows: Osmundaceae, containing the royal ferns; Gleicheniaceae, which are tropical forms; Schizaceae, which include the climbing ferns as well as various other peculiar genera; Hymenophyllaceae, which contain the ferns with the most delicate bodies, often called the "filmy ferns"; Cyatheaceae, which include among other forms the tree ferns; and, finally, Polypodiaceae, the greatest and most highly organized family, to which almost all of the true ferns of the temperate region belong.

The water ferns (Hydropteridineae) contain but few forms and grow either in water or marshy places. They are of particular interest from the morphological standpoint, because they are heterosporous (q.v.). There are two distinct families. Marsiliaceae, represented by the common *Marsilea*, contains semiaquatic species with slender stems, which send down numerous roots into a mucky soil and give rise to comparatively large leaves, each of which has a long erect petiole and a blade of four wedge-shaped leaflets like a four-leaved clover. From near the base of the petiole another leaf branch arises in which the blade is modified as a spore-bearing structure, which incloses the spore cases and becomes hard and nutlike. The other family is the Salviniaceae represented by *Salvinia*, whose species are floating forms.

Fossil Ferns. Our knowledge of Paleozoic ferns has become transformed during the last 10 years. Formerly it was thought that ferns were the dominant vascular group of the Car-

boniferous, constituting at least half of the vascular flora. It has now been discovered that many of these supposed ferns are the leaves of the most primitive gymnosperm group (see GYMNOSPERMS), which had foliage resembling the fronds of ferns so closely that the two groups cannot be distinguished by their leaves. Since there is no assurance that fernlike remains are ferns, it is difficult to determine the fern flora of the Paleozoic. There are numerous frond genera, sporangium genera, and stem genera which suggest ferns, but many of them doubtless belong to the fernlike gymnosperms. In general, two assemblages of undoubted ferns are recognized as existing during the Paleozoic. The most ancient assemblage is known as the *Primo-filices*, a name of convenience to include a plexus of herbaceous forms having stems of simple structure, and also many characters suggesting the origin of the modern families. The only well-defined group of *Primo-filices*, all of whose important structures are known, is called *Botryopteridaceae*, whose principal genera are *Zygopteris* and *Botryopteris*. The other assemblage of Paleozoic ferns does not occur below the Coal Measures, and is called for convenience the *Palaeo-Marattiaceae*. These were arborescent forms with stems of complex structure, and the best-known genus is *Psaronius*, which was evidently a conspicuous tree fern of the later Paleozoic. During the Mesozoic nearly all of the modern fern families began to appear, so that the fern flora is recognized easily.

See Plate of PTERIDOPHYTES.

FERN, FANNY. The pseudonym of Mrs. Sara Payson Willis Parton.

FERN, MALE. A popular name given to the fern *Aspidium filix-mas*. The male fern has a stout, more or less erect, chaffy, perennial rootstock, from which arise numerous annual, bright-green fronds, forming tufts 1 to 4 feet high. The stipe and midrib of the fronds are beset with brownish chaffy scales. The frond is oblong lanceolate, acute at apex and narrow below; the pinnae are lanceolate, somewhat scattered towards the base of the stalk, and often confluent above; the fruiting bodies, or sori, are borne near the midrib of the ultimate segments of the fronds. Male fern is a native of Europe, Asia, northern Africa, and North America, where it is found in rocky woods from Labrador to Alaska and southward into the United States. It is also found in the Andes of South America. The part of the plant which is of commercial importance is the rootstock, which should be gathered between August and October, when its active constituents are most abundant. It is slightly tonic and astringent, but its chief use is as an anthelmintic, especially against tapeworms, for which it is considered a specific. This property of the male fern has long been known and is mentioned in the writings of Dioscorides, Theophrastus, Galen, Pliny, and others. The principal constituents of the rootstock are a greenish oil, the color being due to chlorophyll, a volatile oil, resin, and flicic acid, the latter being considered the active principle.

FERN, SWEET. See SWEET FERN.

FERNALD, fer'nald, CHARLES HENRY (1838-1921). An American zoölogist, born at Mount Desert, Me., and educated at Maine Wesleyan Seminary. During the Civil War he served as an ensign in the United States navy. He was principal of Litchfield Academy in 1865 and of Houlton Academy in 1866-71. After serving as professor at the Maine State College for 15 years he was professor and director of the Graduate School at Massachusetts Agricultural College from 1886 to 1910. He also became entomologist to the State Board of Agriculture. Besides scientific periodical articles, he is author of *Tortricidae of North America* (1882); *The Butterflies of Maine* (1884); *Sphingidae of New England* (1886); *The Crambidae of North America* (1896); *The Pterophoridae of North America* (1898); *The Brown-Tail Moth* (1903); *The Genera of the Tortricidae and their Types* (1908).

FERNALD, CHESTER BAILEY (1869-). An American playwright and author of stories. He was born in Boston, but in 1889 settled in California, where he was assistant draftsman in the United States navy for four years. In 1893-94 he was Washington correspondent of the *San Francisco Chronicle*. He traveled extensively in the United States, Alaska, China, Japan, and European countries, especially in England, where he became a resident in 1907. His plays include: *The Cat and the Cherub*; *The Moonlight Blossom*; *The Ghetto*; *The Married Woman* (1913). He is also author of *The Original Papers* (1892); *The Cat and the Cherub and Other Stories* (1896); *Chinatown Stories* (1899); *Under the Jackstaff* (1903); *John Kennedy's Idea* (1907).

FERNÁNDEZ, Sp. pron. fâr-nân'dáth, JUAN (1536-c.1602). A Spanish navigator. For 40 years Fernández was the leading pilot on the southern Pacific coast. He made numerous voyages between the Spanish headquarters at Panama and the Peruvian and Chilean settlements. It is reported that he also made a voyage westward and visited the unknown lands of New Zealand or Australia, but this is extremely improbable. As the prevailing southern winds and shore currents made the voyage down the coast extremely slow, he was accustomed to sail well out to sea, with the result that he made the voyage in one-third the time taken by the vessels which hugged the shore from cape to cape. His rivals declaring that he was aided by the powers of evil, he acquired the nickname of the "Wizard," and was tried by the Inquisition for sorcery. On one of these voyages, probably in 1592, he hit upon the desert island which has since borne his name. He took possession of it, made a settlement there of 60 Indians, and tried to establish a fishing station. He soon failed and returned to the mainland, leaving on the island a few goats, whose descendants have been its principal inhabitants ever since. A friend took pity on the old and poverty-stricken sailor and gave him a plot of land at Quillota, in the Chilean mountains, where he settled down, after marrying, about 1590 or 1592. He left one son, from whom descended a large family of sailors. Consult Benjamín Vicuña-Mackenna, *Juan Fernández: historia verdadera de la isla de Robinson Crusoe* (Santiago de Chile, 1883), and A. Dalrymple, *An Historical Collection of the Several Voyages and Discoveries in the South Pacific Ocean* (London, 1769-71).

FERNÁNDEZ DE CASTRO, fēr-nān'dsth dā kē'strō, MANUEL (1825-95). A Spanish geologist. He was born in Madrid and, after graduating at the School of Mines there, traveled in various countries to study their railroad systems. The system of railroad signals suggested by him in his *La electricidad y los caminos de hierro* (1857) has been generally adopted. He was engaged in government mining and geological work from 1859 to 1869, when he became professor at the Madrid School of Mines. He was appointed director of the commission on the geological map of Spain in 1873.

FERNÁNDEZ DE CÓRDOBA, kōr'dō-bā, DIEGO, MARQUIS OF GUADALCÁZAR and COUNT OF POSADAS (fl. end of sixteenth and first half of seventeenth century). A Spanish administrator, Viceroy of Mexico and Peru. He was born, probably, at Córdoba and was a descendant of Gonzalo de Córdoba, "the Great Captain." He was Viceroy of Mexico from Oct. 18, 1612, until March 14, 1621. In 1616 he suppressed a serious revolt of the Tepehuan tribe of Indians, who had murdered several Jesuit missionaries living among them. While in Mexico he founded the cities of Lerma (1613), Córdoba (1618), and Guadalcázar (1620), and during his viceroyalty the aqueduct from Chapultepec to Mexico by way of San Cosme was completed. Transferred to Peru, Fernández governed that province as Viceroy, from July, 1622, to January, 1629, during which time he repelled the corsairs who ravaged the coast. In 1623 the Dutch under Jacob the Hermit, with a squadron equipped with 1700 men and 300 cannon, blockaded Callao for six months and attempted to take Lima. During his administration of the province Peru prospered and enjoyed a considerable degree of internal peace and quiet. Fernández returned to Spain in 1629.

FERNÁNDEZ DE CÓRDOBA, FRANCISCO (c.1475-1526). A Spanish soldier and explorer. He accompanied Pedrarias to Castilla del Oro, Panama, in 1514 and in 1524 was sent by that commander to take possession of Nicaragua, ignoring the rights of the discoverer, Gil González Dávila. After exploring the country and founding several important settlements, he endeavored to sever his allegiance to Pedrarias and to establish a government of his own. On learning of the treachery of his lieutenant, Pedrarias conducted an army into Nicaragua and after defeating Córdoba ordered his execution.

FERNÁNDEZ DE CÓRDOBA Y VAL-CÁRCEL, FERNANDO (1809-83). A Spanish commander and statesman, who began military service in the royal guard shortly before the death of Ferdinand VII. His first field service was under his brother Luis, the hero of Mendigorría. In 1841 he was implicated with Concha in the conspiracy against Espartero; in 1847 he was Minister of War, and afterward was inspector general of infantry, and captain general of Catalonia. He was captain general of Cuba in 1850. In 1853 he was made general in chief of cavalry. He attempted to support Isabella in the outbreak of 1854, but when the revolution became successful he fled to France. He returned a few years later, and in 1864 Narváez made him Minister of War. In 1868 he took part in the Prim revolution against Isabella. In 1870 he was again appointed captain general of Cuba, and in 1871 he was made Minister of State *ad interim* at Madrid by King Amadeus. On the

proclamation of the Republic he was named Minister of War. He published a simple and interesting account of his first military experiences in "Mis memorias íntimas" (first in the *Ilustración Española y Americana* and later in an edition de luxe).

FERNÁNDEZ DE ENCISO, ēn-thē'sō, MARTÍN (c.1470-c.1528). A Spanish lawyer and geographer. He went to America in 1500, set up as a lawyer in the island of Santo Domingo, and by 1509 had accumulated a fortune, which in that year he invested in the enterprise of Ojeda for the colonization of Tierra Firme. Ojeda having sailed in 1509, he followed in 1510. He found that Ojeda, beset by hostile Indians and failing of ammunition and supplies, had already returned in search of him. With the survivors of Ojeda's colony he founded Darien. He was shortly after deposed by Balboa, went to Spain, and in 1514 accompanied as alguacil mayor the expedition of Pedrarias, the newly appointed Governor of Darien. He published *Suma de geografía* (1519), the first account in Spanish of the discoveries in the New World, and in general more accurate than other early works of the sort.

FERNÁNDEZ DE LA CUEVA, lá kwā'vá, FRANCISCO, DUKE OF ALBUQUERQUE (c.1610-?). A Spanish administrator. He was Viceroy of Mexico from 1653 to 1660 and as such is said to have encouraged science and art and built up the city of Mexico, but to have been excessively fond of display. The great cathedral of Mexico was completed and dedicated during his administration. In September, 1660, he was appointed Viceroy of Sicily.

FERNÁNDEZ DE LA CUEVA HENRÍQUEZ, ān-rō'kath, FRANCISCO, DUKE OF ALBUQUERQUE. A Spanish administrator of the eighteenth century, a grandson of Francisco Fernández de la Cueva. He was Viceroy of Mexico from Nov. 27, 1702, to Jan. 16, 1711. His term as Viceroy, like that of his grandfather, was marked by no great event, but was remarkable rather for the vast sums of money he squandered in order to maintain his splendid court, which far surpassed that of his predecessors and rivaled in pomp the most brilliant courts of Europe. It must be acknowledged, however, that he was a really able ruler, and well fitted to represent his sovereign in handling the delicate affairs that arose during the war of the Spanish Succession. The town of Albuquerque, N. M., founded at this time, was named in his honor.

FERNÁNDEZ DE PALENCIA, dā pā'lan'thyā, DIEGO (c.1520-81). A Spanish soldier and author. He was born at Palencia, Spain, and in 1545 went to Peru, where he served in the Civil War of 1553-54. Appointed historiographer by the Viceroy Hurtado de Mendoza in 1556, he wrote his celebrated work *Primera y segunda parte de la historia del Perú* (Seville, 1571), which was an account of the Spaniards in Peru from 1544 to 1564. It is generally considered an authoritative work and is the best contemporary account of the conquest of Peru, although some critics have accused the author of partiality. For a notice of the book, consult W. H. Prescott's *History of the Conquest of Peru* (new ed., London, 1902).

FERNÁNDEZ MADRID, mā-drēn', JOSÉ (1789-1829). A South American physician, statesman, and poet. He was born at Cartagena, New Granada (Colombia), and was educated at

Bogotá. He took an active part in the revolt against Spanish rule and, upon the success of the movement, became in 1810 Procurator General. He was a representative in the Convention at Cartagena and upon the establishment of the Republic of New Granada was chosen deputy for Cartagena to its first general Congress. On March 14, 1816, he became President of New Granada, but was captured by the Spaniards and sent to Havana, Cuba, where for nine years he practiced as a physician and also achieved considerable distinction as an agronomist and author. Upon his return to New Granada in 1825, he was appointed by Simon Bolívar Minister to England. In June, 1820, he founded *El Argos*, a scientific, literary, and political periodical. His other works include two tragedies, *Atala* (1822) and *Guatimozin* (1827), a valuable treatise on yellow fever, a book of poems, and various papers on medical, agricultural, and scientific subjects. His fugitive poems and the volume entitled *Las Rosas* are considered his best works. The second and complete edition of his poems was published in London shortly before his death.

FERNANDINA, fēr'nān-dē'nā. An early name of Cuba, given in honor of Ferdinand of Castile.

FERNANDINA, fēr'nān-dē'nā. A city, port of entry, and the county seat of Nassau Co., Fla., on Amelia Island, 37 miles by rail north-northeast of Jacksonville on the Seaboard Air Line Railroad (Map: Florida, E 1). It has a good harbor on Amelia River which separates the island from the mainland. The city's export trade in 1912 amounted to \$8,529,000, the principal articles of shipment being bluefish, phosphates, turpentine, lumber, naval stores, cotton, etc. Fernandina is also a popular winter resort and contains a public library, county courthouse, and a Catholic convent. Among points of interest in the vicinity are Amelia Beach, reached by a fine shell road, and Cumberland Island. The latter was the home of Gen. Nathaniel Greene and is the burial-place of "Light Horse Harry" Lee. Settled by Spaniards in 1632, Fernandina was laid out in 1856 and incorporated in 1959. The present government is administered under a charter, last revised in 1899, which provides for a mayor, elected biennially, and a city council. The water works and electric-light and ice plants are owned and operated by the municipality. Pop., 1900, 3245; 1910, 3482.

FERNANDO DE NORONHA, fēr'nān'dō dā nō-rō'n'yā. A lonely island in the South Atlantic, situated in lat. 3° 50' S. and long. 32° 25' W., about 200 miles east-northeast of Cape St. Roque, on the coast of Brazil, to which it belongs (Map: South America, F 3). It is about 8 miles in length. The surface is rugged, rising in places to an altitude of about 1000 feet. The island, of volcanic origin, is well wooded, and the soil is productive, but lack of sufficient rainfall prevents the growth of luxuriant vegetation. It serves as a penal settlement for the State of Pernambuco. Pop., 2000, mostly convicts, who cultivate corn, cotton, manioc and other fruits.

FERNANDO PO, *Sp. pron.* fēr'nān'dō pō. A volcanic island in the Bight of Biafra, in lat. 3° 12' N. and long. 8° 45' E., about 20 miles off the west coast of Africa (Map: Africa, E 4). It is about 44 miles in length and 20 miles in breadth, with a total area of about 770 square miles. It has a very mountainous surface, rising to an altitude of over 9300 feet at the high-

est point. Forests of mahogany, oak, and ebony cover the slopes, and dense thickets of cotton, sugar cane, and indigo furnish shelter for the varied African tropical fauna. The soil is fertile and well watered, but the climate is excessively hot and unhealthy, the temperature varying but little throughout the year, the average for the coolest month being 74° F. and for the warmest 82° F. The chief products are bananas, rice, yams, corn, palm oil, cocoa, coffee, sugar, tobacco, and vanilla. The trade is insignificant. Pop., 1900, 20,741; 1910 about 25,000 (mostly Bubis and Portos). The island takes its name from the Portuguese navigator Fernando, or Fernão do Po, who discovered it in the latter part of the fifteenth century. Previous to the Spanish-American War it was used as a keep for Cuban political prisoners; since then Spain, deprived of her East and West Indian possessions, has begun much development work. In 1778 it was occupied by Spain. In 1827 the English, with the consent of Spain, founded the colony of Clarence town. Being abandoned by the English in 1844, the island was again taken over by Spain a few years later. Chief town, Port Clarence (Santa Isabel).

FERNEY, or **FERNEY-VOLTAIRE**, fār'nā' vōl'tār'. A town in the Department of Ain, France, 5 miles northwest of Geneva (Map: France, S., L 2). It is noted as the residence, from 1758 to 1778, of Voltaire. A bronze statue of the philosopher stands in the courtyard of the town hall. The chateau which he built has been converted into a museum of his personal relics and is visited annually by a large number of tourists. Pop. (commune), 1901, 1269; 1911, 1172.

FERNEY, THE PATRIARCH OF. Voltaire, so called from his place of retirement near Geneva.

FERNIE. A town in Kootenay District, British Columbia, Canada, situated near the Elk River, and on the Crow's Nest branch of the Canadian Pacific, the Great Northern, and the Morrissey, Fernie, and Michel railways (Map: British Columbia, F 5), about 300 miles east (direct) of Vancouver and about 700 miles by railway. It has fine public buildings, including the customhouse, post office, public and high schools, courthouse, skating and curling rinks, and two hospitals. It is the customs port of entry, judicial centre, and provincial police headquarters for East Kootenay; also the out-fitting point for hunters in the East Kootenay game preserve. Big game is abundant in the vicinity. The manufacturing establishments include saw mills, railway-car shops, a foundry, breweries, brick works, and machine shops. The Crow's Nest Pass Coal Company employs 2000 men, with an annual output of 1,500,000 tons. The town supplies electric light and power. Near by is a 200-acre natural park with race track. Fernie is the seat of a United States consulate. Pop., 1911, 3146; 1914 (local est.), with tributary population, 7000.

FERN ISLES. See **FARNE ISLES**.

FERNKORN, fēr'n'kōrn, ANTON DOMINIK (1813-78). A German sculptor, born at Erfurt, in the Province of Saxony, Prussia. He was a pupil of Stiglmayer and Von Schwanthaler at Munich and in 1840 established himself at Vienna, where he executed his first important work, the heroic equestrian statue "St. George and the Dragon" (courtyard of the Montenuovo Palace). In 1858 he completed for the cathe-

dral of Speyer six of the eight freestone statues of the German emperors there buried. He was appointed director of the Imperial bronze foundry at Vienna and in that capacity did some of his best work (including the colossal equestrian statues of the Archduke Karl and of Prince Eugene, 1860 and 1864, in the Burgplatz, Vienna). Other important works are the monuments to Jellacic in Agram and Joseph Ressel in Vienna. He was skillful in his designs, which are bold and striking, but he lacked nobility of conception and frequently inclined rather to the graphic than the truly plastic.

FERNOW, BERNHARD EDUARD (1851-1923). An American forester. He was born at Inowracław, Posen, Prussia, and was educated at the Academy of Forestry at Münden and at the University of Königsberg. He came to the United States in 1876 and thereafter was chief of the Division of Forestry in the United States Department of Agriculture (1886-98), director and dean of the New York State College of Forestry, Cornell University (1893-1907), professor of forestry in the State College of Pennsylvania for a year, and after 1907 dean of the faculty of forestry in the University of Toronto. For some time he was editor of the *Forester*. His publications include: *The White Pine* (1899); *Report upon Forestry Investigations of the United States Department of Agriculture, 1877-98* (1899); *Economics of Forestry* (1902); *History of Forestry* (1907); *The Care of Trees* (1911). The annual reports and bulletins of the Division of Forestry of the United States Department of Agriculture were edited by him from 1886 to 1898.

FERN OWL. See NIGHTJAR.

FER OLIGISTE (Fr., from *fer*, Lat. *ferrum*, iron + *oligiste*, from Gk. *ὀλιγιστος*, *oligistos*, least, from *ὀλιγος*, *oligos*, small; so called as containing less iron than its related magnetic oxide). A term sometimes applied to those steel-gray varieties of *hematite* that have a metallic lustre, especially the ores from Elba, Russia, and Sweden, which are also called *specular iron ore*.

FERONIA. An ancient Italian goddess, worshipped in Latium and central Italy, especially at Terracina (Horace, *Satires*, I, 5, 24), and by Mount Soracte; at the latter place there was a famous *lucus Feronia*, and a great fair was held there on the feast days of the goddess (Livy, I, 30). Her worship was ultimately introduced into Rome, and a temple was built to her in the Campus Martius; her worship, however, never attained great prominence at Rome. Her temple at Terracina was specially devoted to the manumission of slaves. (Consult Fowler, *Roman Festivals* (London, 1899), and Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).)

FEROZPORE, fē'roz-pōr', or FIROZPUR, fē'roz-pūr' (Hind., City of Firuz, so called from its founder, Firuz Shah III, who reigned in Delhi from 1351 to 1388). The capital of a district of the same name in the Punjab, British India, 3 miles from the southeast bank of the Sutlej (Map: India, B 2). At one time a large and important town, as its massive fortifications and extensive ruins indicate, it had sunk until its population was only about 2500 when it came into the possession of the English in 1835. Traders were induced to settle in the town, a large cotton press was erected, and the place has regained much of its former importance. It has wide streets and colonnaded bazars, and fine

residences on the outskirts. It has a large grain market. The city contains a monumental church in memory of soldiers who fell in conflicts with the Sikhs, and it is the seat of the largest arsenal in India, and an important cantonment. Pop., 1901, 50,437; 1911, 49,341.

FERRACUTE, or FER/RAGUS (It. *Ferran*). A personage appearing in many mediæval romances and in particular in *Valentine and Orson*. He is a giant of either Spanish, Portuguese, or Saracen extraction, of great strength, and invulnerable until he meets Orlando. In his castle is a great head of brass, which answers all his questions.

FERRAND, fā'rān', JOSEPH (1827-1903). A French jurist. He was born at Limoges and from 1871 to 1874 was prefect successively of Haute Savoie, Aisne, and Calvados. In 1888 he was appointed corresponding member of the Academy of Moral and Political Sciences. His principal works are: *De la propriété communale en France et de sa mise en valeur* (1859); *Les institutions administratives en France et à l'Etranger* (1879); *La réforme municipale en France et en Italie* (1881); *Les pays libres, leur organisation et leur éducation d'après la législation comparée* (1884); *L'Organisation municipale de Paris* (1887).

FERRAND, MARIE LOUIS (1753-1808). A French soldier, born at Besançon. He saw his first active service under Count Rochambeau in America and was at Yorktown. He fought in the first campaigns of the French revolutionary wars and became a brigadier general. His friendship for Lafayette led to his imprisonment during the Terror. In 1801, as second in command, he accompanied General Leclerc's expedition to Santo Domingo. Ferrand was placed in command of the troops in the eastern part of the island and was successful in his campaign; but the army under Leclerc, in the western part of the island, after being almost wiped out of existence by yellow fever, had surrendered to the insurgents, and Ferrand, with only 1800 troops, confronted 25,000 men under Dessalines, the rebel leader. He held out bravely for two years, until reinforced by Admiral Missessay in 1805. As Governor-General, he kept the island in comparative peace for several years. Later in 1808 there was a general uprising, with which Ferrand, deserted by the Spanish colonists, was unable to cope. He was attacked and defeated by a superior force under Ramirez, a creole leader, and killed himself on the battlefield.

FERRAR, NICHOLAS (1592-1637). An English theologian. He was born in London, the son of a wealthy merchant, and was educated at Cambridge. From 1618 to 1623, after extensive travels on the Continent, he gave up all his time to the Virginia Company. On the revocation of its charter in 1623, Ferrar turned his attention to political life and in 1624 was elected to Parliament. Afterward he bought a neglected manor house and estate at Little Gidding, in Huntingdonshire, where he was joined by the families of his brother and brother-in-law. He was ordained a deacon and became the religious head of the community, although he never took priest's orders. With the increasing hostility to everything partaking of Catholicism, and the growth of Puritanism, Little Gidding was made the object of bitter attacks, a pamphlet published concerning it in 1641 being entitled *The Armistice Nunnery*. At Little Gidding Ferrar lived

quietly, devoting himself to theological studies and preparing a harmony of the Gospels, of the Mosaic Law, and a history of the Israelites. These works were printed and bound by members of the community. Consult Peckard, *Life of Mr. Nicholas Ferrar* (Cambridge, 1790), of which there have been reprints and revisions; also *The Story Book of Little Gidding* (1899), a volume of his religious dialogues.

FERRARA, fēr-rā'ra. A city of Emilia, northern Italy, capital of the Province of Ferrara and an archiepiscopal see, about 4 miles south of the main channel of the Po and 30 miles north-northeast of Bologna (Map: Italy, C 2). It is situated in fertile, marshy, unhealthy territory, the threshold of the city hall being 3 feet lower than the level of the Po. The broad streets, the ancient walls, towers, and bastions, and the crumbling palaces attest the mediæval glory of Ferrara, when it was the seat of the house of Este (q.v.). It is reputed to have had, in the sixteenth century, 100,000 inhabitants. In the ancient square castle, in the centre of the town, now occupied by the local authorities and the telegraph office, are frescoes by Dosso Dossi (?1474-1542), and dungeons, in one of which the faithless Parisina Malatesta (consult Byron's poem "Parisina") was confined by her husband before being beheaded, May 21, 1425. The cathedral of San Giorgio has a striking façade, dating from the eleventh, twelfth, and thirteenth centuries, but the interior was modernized by Mazzarelli in 1712. Artists whose work is represented here are Baroncelli, Lombardi, Tura, Bastianino, Garofalo, Panetti, Giacomo da Siena. The campanile is massive and handsome. Other interesting churches are San Francesco, dating from 1494, with frescoes by Garofalo and monuments of the house of Este; Santa Maria in Vado, which was altered in 1495 in the early Renaissance style and has frescoes by Bonone; San Benedetto, built 1490-1553, with paintings by Scarsellino; and San Cristoforo.

Other interesting buildings are the episcopal seminary, formerly the Palazzo Trotti, with frescoes by Garofalo; the Palazzo Schifanoja, begun by Alberto d'Este in 1391, completed by Borso in 1469, with celebrated fifteenth-century frescoes, now an asylum for deaf-mutes; the incomplete Palazzo Costabili, with frescoes by Ercole Grandi; the sixteenth-century Palazzo de' Diamanti, containing the municipal picture gallery, most of the works in which belong to the school of Ferrara, at the head of which ranks Dosso Dossi; the Hospital of Santa Anna, where Tasso was confined (1579-86); the tiny house of Ariosto, now the property of the city, bearing a Latin couplet composed by himself; the house of the poet Guarini, which still belongs to his family. In the Piazza Ariostea is a statue of Ariosto (1833) by Vidoni, and between the castle and the cathedral is a monument by Galetti to Savonarola (q.v.), born here in 1452.

The university, which is not a state institution, was founded in 1264 and, after various vicissitudes, reopened in 1815. It has botanical gardens, a physical laboratory, faculties in medicine, mathematics and natural science, and jurisprudence, a rich collection of ancient coins and inscriptions, and a library with 100,000 volumes, over 2000 manuscripts (among them several from the hand of Ariosto himself), 3200 autographs, and numerous etchings, etc. The monument of Ariosto is in the library. Ferrara also has a theological seminary, a gymnasium, etc.,

an Ariosto Society, four theatres, numerous charitable institutions, a chamber of commerce, a telephone system, and public gardens. The city markets wheat, rice, hemp, wine, silk, cattle, salt, and fruit, and has silk, hemp, and soap factories and flour mills.

The origin of the city is very uncertain. We hear of it first about the middle of the eighth century as belonging to Ravenna. Then it passed into the hands of the Count of Modena and finally won its independence from the latter. At the end of the tenth century the popes, basing their authority on grants from Pepin and Charlemagne, bestowed it as a fief on the margraves of Tuscany. In 1208, after a period of independence, it came under the rule of the Este (q.v.), who persuaded Paul II, in 1471, to raise it to a duchy. In 1598, on the extinction of the main branch of the house of Este, Ferrara was united by force to the Papal States by Clement VIII. In 1797 it was united to the Cisalpine Republic and afterward to Napoleon's kingdom of Italy. It was restored to the Pope in 1814 and in 1859 became part of the dominions of Victor Emmanuel. The population of Ferrara is about 35,000; in 1901, the population of the commune was 87,648, and, in 1911, 95,219. (Consult: Frizzi, *Memorie per la storia di Ferrara* (5 vols., Ferrara, 1857 et seq.); Noyes, *Story of Ferrara* (London, 1904); Agnelli, *Ferrara e Pomposa* (Bergamo, 1902); Gardner, *Dukes and Poets of Ferrara* (London, 1904).)

FERRARA, FRANCESCO (1810-1900). An Italian political economist and statesman, born at Palermo. In 1834 he was appointed director of the Bureau of Statistics for Sicily. He was professor of political economy successively at Turin and at Pisa and in 1864 became director of the Bureau of Rates and Taxes. He entered the Chamber of Deputies in 1865, was Minister of Finance under Rattazzi (from May to July, 1867), and in the following year was appointed director of the Royal School of Commerce at Venice. In 1881 he became Senator. He wrote a work on *Importanza dell'economia politica* (1849) and edited the first two series of the *Biblioteca dell'economista* (27 vols., 1850-68). His statistical writings appeared in a volume of the *Annali di Statistica* (Rome, 1890).

FERRARA-FLORENCE, COUNCIL OF. The Council of Basel, convened in 1431 by Pope Martin V, having fallen into a series of disputes with Martin's successor, Eugenius IV, the latter in 1437 issued a bull transferring the sessions to Ferrara. He was obeyed only by Cardinal Julian, the president, and four bishops; the council itself continued in session at Basel. (See BASEL, COUNCIL OF.) To the five delegates, however, who met at Ferrara, Jan. 5, 1438, others fresh from their homes were added, so that at the second session 72 bishops were present, over whom the Pope presided. The Emperor of Constantinople, John Palæologus, was also present and brought with him patriarchs, bishops, and other ecclesiastics, amounting in all to 700 persons. His object in coming was to effect the reunion of the Greek and Latin churches in the hope that he could thus secure the aid of the West against the Turks, who were then pressing hard upon the Empire. The Pope also desired this union as a personal triumph over his adversaries in the Council of Basel, and he hoped that he would be accepted as a leader of the crusade against the Turks. The points of difference between the Greek and Latin churches were

(1) upon the doctrinal point whether the Holy Spirit proceeded, as the Greeks maintained, only from the Father, or, as the Latins held, from the Son also (see *FILIOQUE*); (2) whether the bread used in the Lord's Supper should be leavened, as the Greeks held, or unleavened, as the Latins did; (3) whether the Pope should be accepted as the head of Christendom, overriding the authority of the Greek patriarchs; (4) whether the Greek doctrine of a middle state after death without the remedial pain of fire, or the Roman doctrine of purgatory in which punishment by fire as an expiatory penalty and satisfaction for repented sin, was to be maintained. These and some minor points were discussed. In January, 1439, in consequence of the outbreak of the plague in Ferrara, the sessions of the council were continued in Florence, and there an agreement between the representatives was arrived at; viz., the supremacy of the Pope was acknowledged, the Spirit said to proceed from the Father through the Son, and the Latin views in general prevailed. But the union celebrated on July 6, 1439, was short-lived. The council was continued by the Latins in Rome till 1445, and temporary union made with other Oriental churches. Consult: Hefele, *History of the Councils* (Eng. trans., Edinburgh, 1871); Gorski, *History of the Council of Florence* (Eng. trans., London, 1861); Creighton, *History of the Papacy*, vol. ii (London, 1882).

FERRARESE SCHOOL OF PAINTING.

One of the chief schools of northern Italy, usually grouped with the early school of Bologna as the school of Ferrara-Bologna. It owed its origin, in the middle of the fourteenth century, to followers of Squarcione (q.v.) of Padua and was also influenced by the work of the Florentine Piero della Francesca (q.v.) at Ferrara. From the former it derived its archaeological and naturalistic tendencies, from the latter its knowledge of perspective. It was also characterized by good drawing, modeling, and careful execution, but was deficient in color. The school of Ferrara grew up under the patronage of the house of Este. Its chief representatives were Cosimo, Tura, Lorenzo Costa, Dosso Dossi, and Garofalo (qq.v.). The Bolognese school originated about 1470, when a number of Ferrarese artists, chief among whom was Lorenzo Costa, went to Bologna. Francesco Francia, the head of the school, learned painting from Costa; he and Timoteo Viti (q.v.) were its chief masters. Consult: Baruffaldi, *Vite de' pittori Ferraresi* (Ferrara, 1844); Laderchi, *Pittura Ferrarese* (ib., 1856); Crowe and Cavalcaselle, *History of Painting in North Italy*, ed. Borenius (London, 1912); Morelli, *Italian Painters*, vol. ii (ib., 1900); Borenius, *North Italian Painters of the Renaissance* (New York, 1907).

FERRARI, FER-RI'RA, BENEDETTO (1597-1681). An Italian poet and composer, sometimes called Della Tiorina. He was born at Reggio and was educated at Rome. The opera *Andromeda*, for which he wrote the text, and which was set to music by Manelli da Tivoli and performed at Ferrari's expense at the Teatro San Cassiano at Venice (1637), was the first opera to be produced publicly, all previous compositions of this kind having been performed privately.

FERRARI, ETTORRE (1849-). An Italian sculptor. He was born in Rome and studied at the Accademia di San Luca, in which he was later appointed a professor. He came to be recognized as one of the most eminent Roman

sculptors of his day. His work is accurate and sensitive in modeling, minute and naturalistic in detail, and forceful and truthful in expression, but is often marred by excessive emotionalism. Among his best-known productions are a statue of Ovid in Rumania; the widely admired figure of Giordano Bruno in the Campo di Fiore, Rome; the equestrian statue of Victor Emmanuel on the Riva at Venice; the majestic ideal figure of Ancient Latium for the frieze of the National Monument to Victor Emmanuel, Rome; the graceful bronze lyre on Shelley's grave in Rome. He became vice president of the Superior Council of Fine Arts and a commander of the Crown of Italy.

FERRARI, CAUDENZIO (c.1484-1546). A Lombard painter of the Renaissance. He was born at Valduggia in Piedmont. Little is known of his life, which was passed mostly at Vercelli, Varallo, and Milan, where he took up his residence in 1536 and died on Jan. 31, 1546. It was formerly supposed that his first teacher was Girolamo Giovenone at Vercelli; but this view was overthrown by Morelli. He is now thought to have studied under Scotto at Milan, and he was certainly influenced by Bramantino and Luini. Whatever he adopted from these masters he thoroughly assimilated, adding to it an energetic naturalism of his own. In his earlier period he painted in the manner of the Lombard school, but towards the end of his life he adopted the exaggerated forms then in vogue, and his works show the growing influence of Correggio. They always display intense dramatic action, although the composition is often overcrowded. In his frescoes the color is bright, sometimes even gaudy, but harmonious. He excels especially in heads and draperies. His works are of unequal merit, the later being generally inferior, but he is in many respects the most powerful master of the Milan school.

Among Ferrari's earlier works are a triptych representing a "Holy Family with Saints" (1511), for the church of Santa Maria at Arona, and an altarpiece for the church of Canobbio and for San Gaudenzio at Novara (1514-15). A number of his most important works are at Varallo, where he lived for a long time. In 1513 he had finished in the church of Santa Maria delle Grazie 20 frescoes of the "Life of Christ"—a wonderfully dramatic series in well-arranged, though sometimes crowded, groups. In the chapel of Santa Margherita, in the same church, he painted two frescoes of the "Life of Christ" (finished in 1515), and for San Gaudenzio a fine altarpiece, the "Marriage of St. Catharine"—perhaps the best of his earlier work. He frescoed the walls of three of the "stations" or chapels of the Sacred Mountain of Varallo and also modeled a number of terra-cotta groups in the other chapels of which the "Holy Family" and the "Adoration of the Magi" are the only ones that survive. Of these paintings, his great but much damaged "Crucifixion," in the thirty-eighth chapel, is the masterpiece. Its groups, in their symmetrical arrangement and the dignified heads and harmonious colors, challenge comparison with Raphael himself. In 1530-34 Ferrari decorated two chapels of the church of San Cristoforo, Vercelli, with frescoes of the "Life of the Virgin" and the "Life of St. Mary Magdalen," and in 1535 the cupola of the church of Saranno with a circle of "Singing Angels"—one of the finest existing specimens of such work. In 1542 he painted his fresco, "Scourging

1891 had been banished a few months for Socialism, and for several years he made a great success as a publicist. In 1898 he lectured on militarism in Milan. His main work was a history of Rome. To this work, *Grandezza e decadenza di Roma* (1902-08; in English, *Greatness and Decline of Rome*, 1907-09), he brought the training of a psychologist with some knowledge of economics. The work is more ambitious than scholarly and is singularly bold in its criticism of the Latin and Greek historians. In 1906 he lectured at the Collège de France; in 1907 travelled in South America; and in 1908 visited the United States, lectured at the Lowell Institute and elsewhere, and published *Characters and Events of Roman History*. He also wrote *Fra i due mondi* (1913; English version, *Between Two Worlds*) and *Ancient Rome and Modern America: A Comparative Study of Morals and Manners* (1914). For a critique, especially of his far-fetched modernism, consult Besnier, "L'Œuvre de M. Guglielmo Ferrero," in *Revue Historique*, vol. xcv, pp. 54-74 (1907).

FERRET (Fr. *uret*, It. *furetto*, from ML. *uretus*, dim. *furo*, ferret, from Lat. *fur*, thief; apparently connected by popular etymology with Lat. *fera*, wild beast). 1. An animal of the weasel family (Mustelidae), so nearly allied to the polecat (*Putorius fœtidus*) that many regard it as a mere domesticated albinotic variety. Others regard it as a distinct species, which they call *Putorius furo*. It is of rather smaller size, the head and body being about 14 inches long, the tail $5\frac{1}{2}$ inches, the muzzle somewhat longer and more pointed, the head rather narrower; the color is very different, being yellowish, with more or less of white in some parts, due to two kinds of hair—the longer partly white, the shorter yellow. The eyes are pink. It is, however, much more susceptible to cold than the polecat and requires careful protection from it in climates where the polecat is a hardy native. It was imported into Europe from Africa and was used in Rome as a mouser. Attention to warmth and cleanliness is essential to the health of ferrets. They are capable only of partial domestication, acquiring a kind of familiarity with man, and submitting with perfect quietness to his handling, but apparently never forming any very decided attachment; and they never cease to be dangerous if not carefully watched, especially where infants are within their reach. If allowed any measure of freedom, they are ready to attack poultry and kill far more than they can devour, merely sucking the blood. They generally breed twice a year, each brood consisting of six or nine. The female sometimes devours her young, in which case another brood is speedily produced. Consult: Everitt, *Ferrets: Their Management* (London, 1897); Johnston, *British Mammals* (ib., 1903); Millais, *Mammals of Great Britain and Ireland* (ib., 1904-06). See Plate of FUR-BEARING ANIMALS.

2. In the Western United States, a weasel of the plains, the black-footed ferret (*Putorius nigripes*), which lives in the prairie-dog "towns," feeding on those animals. It is pale brown, with the feet, tip of tail, and a bar across the face black. It is about 2 feet long.

FERRETING. The ferret is bred and trained in captivity. Rabbits have the same instinctive apprehension of coming danger from the presence of the ferret that birds in general have of the sky-flying hawk, and hunters take advantage

of this characteristic. They breed the ferret and place it—sometimes free, sometimes on a string, and sometimes muzzled—in the burrows or underground runs in a rabbit warren, from which its presence causes the rabbits to scurry off into the open fields. The young ferrets are taught by being entered in the first instance with their mother. Ferrets are equally efficacious in starting rats from their underground homes or from the bottom of grain stacks, where they do great damage. The use of ferrets in hunting is prohibited in many of the United States and is discountenanced by most conservative sportsmen, except where rabbits have become so plentiful as to be pests.

FERREREX AND PORREX. See GORBODUC.

FERRI, fèr-rè, CIRO (1634-89). An Italian painter, born in Rome. He was the pupil of Pietro da Cortona and so imitative of that master that it is difficult to distinguish their pictures. Ferri is usually the inferior in color, vigor, and grace of design. After the death of Pietro he completed the latter's unfinished works, notably the frescoes in the Pitti Palace, Florence. Ferri's principal works are the frescoes of biblical subjects in Santa Maria Maggiore at Bergamo, a fine "St. Ambrose" in Sant' Ambrogio della Massina, Rome, and the frescoes in the cupola of Sant' Agnese, Rome, which were completed after his death and partially marred by Corbellini. Among his easel pictures are: "Dido and Æneas" (Dresden Gallery); "Madonna" (Munich); "The Triumph of Bacchus" (Hampton Court); "Christ Appearing to Mary Magdalen" (Vienna); "Alexander Reading Homer"; his own portrait; and "Christ on the Cross" (Uffizi Gallery, Florence). He is also known by skillful miniature drawings for religious works of the time. His most important pupil was Gabiani.

FERRI, ENRICO (1856-). An Italian criminologist, born at San Benedetto-Po, Mantua. He studied at Bologna, Pisa, and Paris, lectured at various Italian universities, and later practiced law at Rome. In 1886 he became a Socialist member of the Chamber of Deputies. His publications include: *Sociologie criminale* (1893; published in Eng. trans. as *Criminal Sociology*, New York, 1896, in the "Criminology Series"); *La scuola positiva di diritto criminale* (1883; Eng. trans. by E. Untermann, *The Positive School of Criminology*, 1906); *Difese penale e studi di giurisprudenza* (1898); *Delinquenti nell'arte* (1901).

FERRI, LUIGI (1826-95). An Italian philosopher, born at Bologna. He was educated in France and taught in several of the French colleges before he settled in his native country. After occupying the chair of philosophy and history at the Institute of Florence (1863), he was called to the same position at the University of Rome (1871). While there he became corresponding member of the Institute of France and editor of *Rivista italiana di filosofia*. His works include: *Il genio d'Aristotele* (1866); *Il senso comune nella filosofia* (1872); *La psicologia di Pietro Pompanazzi* (1877). In French he wrote: *Essai sur l'histoire de la philosophie en Italie au XIXème siècle* (1869) and *La psychologie de l'association depuis Hobbes jusqu'à nos jours* (1883). He represented in philosophy a spiritualism akin to Cousin's, whose pupil he was.

FERRIC OXIDE, or SESQUIOXIDE OF IRON. See IRON; HEMATITE.

FERRICYANIDE OF POTASSIUM. See HYDROFERRICYANIC ACID.

FERRIER, SIR DAVID (1843-). A Scottish neurologist. He was born in Aberdeen, Scotland, studied at Aberdeen and Edinburgh in Scotland and at Heidelberg in Germany, and for many years after 1889 was professor of neuropathology in King's College, London. He also became consulting physician to King's College Hospital and to the National Hospital for Paralyzed and Epileptic. In 1911 he was knighted. His researches on the functions and the diseases of the brain have formed contributions of the highest importance to the science of medicine. He published: *The Functions of the Brain* (1876; new ed., 1886); *The Croonian Lectures on Cerebral Localization* (1878, 1890). He was also a founder and an editor of *Brain: A Journal of Neurology*.

FERRIER, fâr'yâ', GABRIEL (1847-1914). A French painter, born at Nîmes. He studied under Pils, Lecoq de Boisbaudran, and Hébert, and won the Prix de Rome in 1872. In 1878 his "St. Agnes" (now in the Rouen Museum) obtained a first-class medal at the Paris Exposition, and in 1889 his "Mothers Cursing War" (Amiens Museum) received the same honor. He was awarded the medal of honor in the Salon in 1903. His drawing is excellent and his handling free, vigorous, and sincere. His portraits, of which that of General André in the Luxembourg is a good example, are strong and realistic. His other works include: "Spring"; a portrait of Baroness Akermann (Munich Pinakothek); "Sorrow" (Luxembourg Museum, Paris); and "The Dead Christ" (Nîmes Museum). He painted decorations in the Hôtel de Ville, the Sorbonne, and the Palais d'Orsay, Paris, and became a member of the Institute, an officer of the Legion of Honor, and a professor at the Ecole des Beaux-Arts.

FERRIER, JAMES FREDERICK (1808-64). A Scottish metaphysician, born in Edinburgh. He graduated at Oxford in 1831, was elected to the chair of civil history in the University of Edinburgh in 1842 and in 1845 to that of moral philosophy and political economy in the University of St. Andrews, where he remained until his death. According to Ferrier's "theory of knowing and being" which was elaborated under the influence of Kant and his successors, the ego enters as an essential constituent into every conception that the mind is capable of forming. The connection between the conceiving conscious mind and conceivable being is intimate and indissoluble. To be knowable, *object* must coexist with *subject*, and it is fallacious to speak even of our ignorance of "matter *per se*"; for while we may be ignorant of what could possibly be known, we cannot be ignorant of what is absolutely unknowable--what is neither an entity nor a nonentity--the material world *by itself*. Ferrier's works include the *Institutes of Metaphysics* (1854) and *Lectures on Greek Philosophy and Other Philosophical Remains of J. F. Ferrier*, published posthumously (1866).

FERRIER, fâr'yâ', PAUL (1843-). A French dramatist. He was born at Montpellier and became an officer of the Legion of Honor. His plays include: *La revanche d'Iris* (1868); *Chez l'arçat* and *Les incendies de Massoulard* (1873); *Les compensations* (1876); *Les mousquetaires au couvent* (1880); *Babolin* (1884); *Tabarin* (1885); his greatest success, *Joséphine vendue par ses sœurs* (1886), with music by

Victor Roger; *Le fétiche* (1890); *Calendæ* (1894); *Le carillon* (1896); *La belle-mère* (1898); and the opera libretti, *La Marocaine* (1879), *Le chevalier d'Harmental* (1896), and *La fille de Tabarin*, with Sardou (1901).

FERRIER, SUSAN EDMONSTONE (1782-1854). A Scottish novelist. She was born in Edinburgh. Her first work, *Marriage*, appeared in 1818, and this was followed by *The Inheritance* (1824) and *Destiny* (1831). The merit of these tales, which are characterized by genial wit, a quick sense of the ludicrous, and considerable ability in the delineation of national peculiarities, is sufficiently proved by the fact that they have held their ground, notwithstanding the enormous number of novels which have flowed from the press since their publication. Like her friend, Sir Walter Scott, she owes a debt to Maria Edgeworth, who in *Castle Rackrent* (London, 1800) showed how to make provincial manners and life the material of fiction. Her novels were edited by Johnson (London, 1893). Consult her *Memoirs and Correspondence*, edited by Doyle (London, 1898).

FERRIÈRES, fâr'ryâr'. A village in the Department of Seine-et-Marne, France, 17 miles southeast of Paris (Map: France, S., II 4). It has an interesting thirteenth-century church, but is chiefly famous for the splendid château (built 1800) in modern Renaissance, which was the headquarters of King William of Prussia from Sept. 19 to Oct. 5, 1870, and in which Jules Favre unsuccessfully attempted to negotiate an armistice with Prince Bismarck. The château is the property of Baron Alfonse Rothschild. Pop. (commune), 1901, 961; 1911, 815.

FERRIS, ALBERT WARREN (1856-). An American psychiatrist, born in Brooklyn, N. Y. He graduated from New York University in 1878 and from the College of Physicians and Surgeons (Columbia University) in 1882, was an interne for two years, and at various times was assistant resident physician in several private sanitariums for insane or nervous patients. In 1892 he took up the practice of medicine in New York City, serving also as assistant in medicine at the University and at Bellevue Hospital Medical College and as assistant in neurology at the College of Physicians and Surgeons. He was a consulting physician to the Italian Hospital, New York, and to the Binghamton State Hospital; for a time was senior resident physician at the Glen Springs, Watkins, N. Y.; and in 1913 became medical expert to the State Reservation Commissioners at Saratoga Springs. At various times he was on the staffs of the *American Medico-Surgical Bulletin*, the *Medical Critic*, and the *State Hospitals Bulletin*; he also contributed to the NEW INTERNATIONAL YEAR BOOK and to the NEW INTERNATIONAL ENCYCLOPEDIA. In 1907-11 he was president of the New York State Commission in Lunacy.

FERRIS, ISAAC (1798-1873). An American clergyman. He was born in New York City and graduated at Columbia College in 1816. He served as bombardier at the Battery, New York City, during the War of 1812, under his father, Capt. John Ferris. After teaching Latin at the Albany Academy, he studied theology under the Rev. Dr. John Mitchell Mason and at the Reformed Dutch Church Seminary, New Brunswick, N. J., where he graduated in 1820. He was successively pastor at New Brunswick, N. J. (1821-24); Albany, N. Y. (1824-30);

and in the Market Street Dutch Reformed Church, New York City, the fashionable church of the old Seventh Ward (1836-53). He was president of the New York Sunday-School Union from 1857 to 1873, organizer and president of the Board of Foreign Missions of the Dutch Reformed Church, founder and president of Rutgers Female Institute, and third chancellor of the University of the City of New York, serving from 1852 to 1870, and by his admirable management relieving the institution from the debt which had encumbered it since its foundation. His publications include *Memorial Discourse; or, Fifty Years' Ministry in the Reformed Church of America* (1871).

FERRIS, JOHN MASON (1825-1911). An American clergyman, born at Albany, N. Y. In 1843 he graduated from New York University (A.M., 1846), and he also studied at the New Brunswick Theological Seminary for three years. Ordained to the Dutch Reformed ministry in 1849, he thereafter held pastorates at Tarrytown, N. Y. (1851-54), Chicago (1854-62), and Grand Rapids, Mich. (1862-65). In 1864-65 he was a professor in the Western Theological Seminary (Holland, Mich.), and from 1865 to 1883 he was secretary and in 1880 treasurer of the Board of Foreign Missions of the Dutch Reformed Church. From 1881 to 1906 he was editor of the *Christian Intelligencer*.

FERRIS, WOODBRIDGE NATHAN (1853-). An American educator and public official. He was born at Spencer, N. Y., and was educated in the Oswego (N. Y.) Normal and Training School and the medical department of the University of Michigan. He served as principal of a business college and academy at Freeport, Ill. (1875-76) and of a similar institution at Dixon, Ill. (1878-79), as professor in Rock River University, Dixon (1876-77), and as superintendent of schools at Pittsfield, Ill. (1879-84). Removing to Big Rapids, Mich., he founded (1884), and was thereafter president of, the Ferris Institute. He became president of the Big Rapids Savings Bank. After once (1904) failing of election as Governor on the Democratic ticket, he was elected (1912), and again 1914. In this office he aroused considerable criticism by his management of the strike situation in the Michigan copper mines.

FERRO (Sp. *Hierro*). The most westerly and smallest of the Canary Islands (q.v.), having an area of about 105 square miles (Map: World, Eastern Hemisphere, G 19). It is of volcanic origin, rising to an altitude of 4640 feet. Pop., 1910, 7607. It lacks running water and springs and is not fertile but produces some grain and wine. Ferro has been regarded as the most westerly point of the Old World. Geographers at one time reckoned longitude from the meridian of the island, and this custom prevailed with German cartographers until recently. The meridian of Ferro is 17° 40' W. of Greenwich. Chief place, Valverde.

FERROL, fâr-rôl' (Lat. *Ardóbrica*), EL. A seaport in the Province of Coruña, Spain, situated on a narrow arm of the Bay of Betanzos, 12 miles northeast of Coruña (Map: Spain, F 5). Originally a fishing town, it was selected for its natural advantages as a seaport by Charles III, who erected here for the Spanish navy what was at one time the finest naval arsenal in the world. The arsenal, with dockyards and shops, covers an area of about 24 acres and is still one of the largest shipbuilding centres in

Spain. A naval school is maintained in connection with it. Entrance to the harbor of El Ferrol is gained only through a very narrow strait, which is defended by the castles of San Felipe and Palma. The town, strongly fortified also on the land side, consists of three distinct sections, of which Ferrol Nuevo is most notable. Here are many of the finest buildings of the city, and the streets are wide and regular. El Ferrol has several squares and pleasant alamedas or promenades. The Plaza de Armas is the site of a fine memorial fountain to Churrucá, a celebrated naval officer. The city has manufactures of sailcloth, leather, spirits, chocolate, linen, and hardware, and carries on an important trade. The fisheries also constitute an extensive industry. Pop., 1900, 26,257; 1910, 26,270. El Ferrol appears first in history in the early years of the thirteenth century, but it did not attain any particular importance until its development in the eighteenth century as a naval station. An unsuccessful attack on the port was made in 1800 by the English. It was captured by the French in 1809 and in 1823.

FERRON, fâ'rôn', THÉOPHILE ADRIEN (1830-94). A French general, born at Pré-Saint-Evroult, Eure-et-Loire. He studied at the Ecole Polytechnique, entered the engineers in 1852, and rose to be colonel in 1878 and a general of division in 1886. He distinguished himself in the Crimea, was a professor of military science in the Ecole d'Application at Metz, became connected with the Ministry of War in 1880, and held the portfolio of War in 1887 (May 30-November 20). His publications comprise: *Considérations sur le système défensif de la France* (1873); *Considérations sur le système défensif de Paris* (1875); *Instructions sommaires sur le combat* (1883); *Quelques indications pour le combat* (1892).

FERROTYPE (from Lat. *ferrum*, iron + Gk. *τύπος*, *typos*, type), or **TINTYPE**. A photographic print made on a plate of enameled iron previously coated with black varnish, and immersed first in collodion and then in a sensitive silver solution. After a few seconds' exposure the operator proceeds at once to develop, fix, and wash the plate, on which the picture, though really nothing but an insufficiently exposed or poorly developed negative, appears like an ordinary photograph, owing to the dark color of the background. Consult Estabrooke, *Ferrotypes, and How to Make It* (Cincinnati, Ohio, 1872). See **PHOTOGRAPHY**.

FERRUCCI, fêr-rû'chê, ANDREA (1465-1526). A Florentine sculptor, born at Fiesole. He was a pupil of Francesco di Simone Ferrucci and Michele Maini at Florence. He has much of the pure devotional charm of Mino, Rossellino, and Desiderio, although his later works, especially the "St. Andrew" (Florence Cathedral), show the influence of Michelangelo. From 1512 to 1518 he was superintendent of the works of the cathedral for which he executed an original and lifelike bust of Marsilio Ficino and a statue of St. Andrew. His masterpiece is the marble baptismal font in the cathedral of Pistoia, carved in relief with scenes from the life of Christ and John the Baptist. The composition is of great beauty, and the architectonic structure excellent, although the figural part is subordinated to the ornamental, as in all his creations. Other works are a marble reredos of exquisite detail, with an "Annunciation" in two medallions, in the cathedral of Fiesole; a "Holy Family," in

the Bargello, Florence; the tomb of the Saliceti, in San Martino, Bologna; and the decoration of the aisle of San Martino for Ferdinand I of Naples. The tomb of Antonio Strozzi, in Santa Maria Novella, Florence, which was begun by Ferrucci, was completed by his pupil Casini and Tommaso Boscoli.

FERRY (from AS. *ferian*, to carry, Goth. *farjan*, to row, causative of AS., Goth., OHG. *faran*, Ger. *fahren*; connected with Gk. *perān*, *peran*, Skt. *par*, to cross). A passage by boat, generally across a comparatively narrow waterway not readily provided with a bridge. Common rowboats are generally used for ferrying foot passengers, but when horses and carriages or motor vehicles have to be taken across, a flat-bottomed barge may be used, propelled by oars or carrying sails; or drawn by a rope, either by manual labor or the force of the current, as noted below. Such boats are sufficient for light traffic, but where the traffic is heavy, or the crossing broad, power-propelled ferryboats are used.

Flying Bridge is the name sometimes given to a kind of ferryboat which is moved across a river by the action of the combined forces of the stream and the resistance of a long rope or chain made fast to a fixed buoy in the middle of the river. The boat thus attached is made to take an oblique position by means of the rudder; the stream then, acting against the side, tends to move it in a direction at right angles to its length, while the rope exerts a force in the direction towards the buoy. The course of the boat and the action of the two forces are analogous to the path of a rising kite and to the forces of which this path is the resultant. The holder of the kite corresponds to the buoy, the wind to the tidal stream, and the tail to the rudder.

Steam Ferryboats, until recently, were propelled by a paddle wheel at each side, driven by a walking-beam engine. There was but one deck, placed a few feet above the water. This is still a common type, but the larger boats built since 1890, particularly those for service at New York City and at San Francisco, usually are driven by means of screw propellers and have two decks. This affords spacious cabins on the lower decks, makes a commodious and well-lighted saloon with an outer promenade possible on the second deck, increases the speed and mobility of the boats, and lessens the troubles caused by ice. The first of these double-screw ferryboats at New York was the *Bergen*, running between New York and Hoboken. It was put in use in 1889. A later boat of the same general type and, on account of the long ferry, a particularly large one, was the *Berkoley*, built for the Southern Pacific Railway Company, to run between San Francisco and Oakland, Cal., and put in service in 1898. Other notable ferry steamers have been built for service in San Francisco Bay, while of large and modern construction are the municipal ferry steamers of the city of New York running between Manhattan and Staten Island. The use of tubes or tunnels, such as the Hudson and Manhattan and Pennsylvania tube between New York and New Jersey, has served to cut down the importance of ferries for passengers, especially in connection with railway terminals; but the increased use of motor vehicles has in many places given them a new importance.

With the increase of electric interurban railways and the extended use of motor vehicles, a

new form of ferryboat has been developed, viz., one where internal-combustion motors have been fitted to a shallow-draft vessel so that a river of considerable width, where conditions do not permit the construction of a bridge, may be crossed. Various types of such craft have been developed on the Ohio River and elsewhere in the United States.

Ferry Houses are provided at each end of important ferries. They contain ticket offices and waiting rooms and often a great variety and number of accessories, like news and flower stands and restaurants. To accommodate the landing places to the rise and fall of the tides, or other variations in the water level, bridges are provided, with the shore end made fast and the water end free to rise and fall with the water. The boats run into slips, formed of fenders, or piles covered with planking.

Car-Transfer Boats are used to convey trains of cars across streams or other bodies of water where bridges or tunnels are impracticable or the distance too great. In many instances, as in the case of the vast numbers of freight cars transferred at New York City, the trains are broken up into short sections and run upon flatboats, which, when loaded, are towed by tugboats. In this manner the wharves and waters adjoining New York, Hoboken, and Jersey City are made to serve the same purpose as hundreds of acres of switching yards, while at the same time the cars are being transferred from one railway to another or to various loading piers. Instead of mere flatboats, moved by tugs, some transfer boats are self-contained. Such a vessel, the *Maryland*, for many years was employed in New York harbor to transfer the Boston-Washington expresses from Harlem River to Jersey City. This service was abandoned in 1912. Probably the longest water-transfer route of this sort is that across Lake Michigan, from Frankfort, Mich., to Kewaupee, Wis., a distance of 63 miles. It was put in operation in 1892 by the Toledo, Ann Arbor, and Northern Michigan Railway Company. Each boat carries 24 cars, placed on four parallel tracks, and is driven by three screw propellers. The boats are designed to break their way through ice, and the usual construction is with a solid bow with access for the cars at the rear to the tracks laid on the main deck. In 1911 a vessel 363 feet in length, with a capacity of 30 42-foot cars, was put in service by the Ann Arbor Railroad Company between Frankfort, Mich., and Manitowoc, Wis. Special bridges are used to transfer the cars from the land to the boats. From Grand Haven to Milwaukee there is a car ferry where a large vessel, 350 feet in length, having a capacity of 30 loaded freight cars, is employed. A ferry service is maintained between Rochester, N. Y., and Coburg, Ontario, a distance of 56 miles, the steamer *Ontario* being able to transport 30 50-ton coal cars. In 1914 a second steamer of 500 tons, 317 feet in length and 56-foot beam, was ordered, able to accommodate 28 freight cars and 900 passengers. One of the largest and most modern of American car ferryboats, the *Contra Costa*, 433 feet, 4 inches in length, 66 feet, 6 inches in beam, and with a depth amidships of 19 feet, 9 inches, was launched and put into service in 1914. This ferryboat was built for service on San Francisco Bay to handle the freight and passenger cars of the Southern Pacific Railway. It carried four tracks, spaced so as to give a clearance of 3 feet, 6 inches between

cars of normal width, and had a capacity of 36 freight cars and two locomotives, or two locomotives and 24 passenger cars. See PUBLIC UTILITIES, REGULATION OF.

A car ferry across Lake Baikal, a distance of 28 miles, on the line of the Trans-Siberian Railway, was opened in 1900 and was interesting on account of the vessel's having to serve as an ice breaker in addition to being a transport. The boat, which had an over-all length of 290 feet, was fitted with three propellers, one in the bow and two astern. It was able to break through ice 39 inches thick. In Europe the ferry between Sassnitz and the Isle of Rügen, on the north coast of Germany, and Trelleborg, on the south end of Sweden, a distance of 65 miles, employs twin-screw steamers that carry complete trains. These vessels, 370 feet in length, with a speed of 16½ knots, are very seaworthy, being built with solid bows for heavy weather, and at the landings are backed into position, the cars being switched on board through doors in the rear. The cars are jacked up and made fast by chains so that they cannot roll in rough weather. A ferry of this type is planned to transfer cars from the island of Key West, Florida, to Havana, Cuba, a railway having been already constructed to connect Key West with the mainland.

In law the right to maintain a ferry is a franchise, created by a grant from the sovereign power of the state, and is a property right of the class known as incorporeal hereditaments. The owner of this franchise has, as an incident thereto, the right not only to pass over the water, but to use the highway on either side for the conduct of his business. Indeed, a ferry is the continuation of the highway from one side of the water over which it passes to the other, although subject to the public right of navigation in such water. Any one who unlawfully invades the valid ferry franchise of another is liable at common law in damages to the latter and may be enjoined by the Court of Chancery from further interference. Such violation may amount to a crime at common law or under modern statutes. Correlative to these legal rights of the ferry owner are certain well-defined legal duties. Having received a public franchise, he is bound to serve the public faithfully and impartially. He must have suitable boats, docks, and accommodations; he must employ proper servants and agents, and his tolls must be reasonable. If he fails in the performance of any of these duties, he may be liable to a private action for damages, to a criminal prosecution, or to the forfeiture of his franchise. His liability for the safety of passengers and of freight is that of a common carrier (q.v.). See *FRANCHISE*; and consult: *Glen, Law Relating to Highways, Bridges, and Tramways* (2d ed., London, 1897); *Pratt, Law of Highways, Main Roads, and Bridges* (16th ed., ib., 1911); *Washburn, Treatise on the American Law of Real Property* (6th ed., Boston, 1902).

FERRY, fèr', JULES FRANÇOIS CAMILLE (1832-93). A French statesman and journalist. He was born at Saint-Dié, in the Department of Vosges, April 5, 1832. Admitted to the bar in Paris in 1851, he became connected with the *Gazette des Tribunaux*, joining the group of young lawyers who opposed the Empire. He was among the famous 13 condemned to imprisonment in 1864. In 1865 he became a writer on the *Temps*, where his brilliant political articles

attracted much attention. In 1869 he was elected to the Corps Législatif taking his seat among the members of the Left. He demanded the dissolution of the Corps Législatif and was a powerful opponent of Ollivier. He voted against the declaration of war with Prussia. After the fall of Sedan he and the other Paris deputies were proclaimed members of the Government of the National Defense, Sept. 4, 1870. Ferry was secretary of this body and as prefect of the Seine administered Paris during the siege in alliance with Thiers. He was elected one of the representatives of the Department of the Vosges, and resigned his place in the government in 1871. In 1872 he was appointed Minister to Greece by Thiers, but resigned the position the following year. On the fall of Thiers, he returned to Paris and, entering the National Assembly, conducted an energetic struggle against the monarchical elements that threatened to submerge the infant Republic. He contributed to the fall of M. de Broglie in 1874 and in his brilliant speeches foreshadowed the anticlerical policy for which he is best known. In 1877 he opposed MacMahon's monarchical plans and contributed to a Republican triumph in the elections of 1879. He initiated the policy of republicanizing the personnel of the administrative and judicial departments. When Grévy became President of the Republic in 1879, Ferry was appointed Minister of Public Instruction and initiated his policy of breaking the control over popular education which the Church had obtained since 1850. In March, 1879, he secured the passage of the famous Ferry laws which suppressed the right claimed by the congregations of appointing teachers to the public schools without degrees, for the exclusion of the clergy from university councils, and the abolition of their right to confer degrees. It was Article 7 of this law about which the battle raged; it deprived every congregation that did not obtain the authorization of the state—the Jesuits in particular—of the right of imparting instruction. The year following he became President of the Council and Prime Minister, but on Nov. 14, 1881, resigned on account of the attacks made on his policy in regard to Tunis. By the Law of June 16, 1881, the schools of the Republic were organized, and the following year education was made free, secular, and obligatory. A system of normal schools was established and, in the face of the opposition of the Church, a scheme for the education of the women of the middle classes. In 1882 he was Minister of Public Instruction under Freycinet, and in the following year became Prime Minister again. In all of these positions he manifested bitter hostility to the Jesuits and was largely instrumental in securing their banishment from France. In 1885 the unsatisfactory result of the war in Tonkin, which culminated in the defeat of the French at Langsun, on the Chinese frontier, led to Ferry's final resignation, March 30. His colonial policy, which had mere economic exploitation as its aim with Bismarckian tactics as a means, was the cause of his political failure. In spite of his loss of political power he was still an influential member of the Chamber of Deputies, and in December, 1887, was a candidate for the presidency, but was defeated. A few days after the election he was wounded by a pistol shot fired by a fanatic named Aubertin in the lobby of the Chamber of Deputies. In 1889 he failed to be reelected to the Chamber, but in January, 1891, was chosen senator. He

came unscathed through the Panama scandal and was made President of the Senate, Feb. 24, 1893. He died shortly after, March 17, 1893. Consult: Sylvin, *Célébrités contemporaines* (Paris, 1883); King, *French Political Leaders* (New York, 1882); Rambaud, *Jules Ferry* (Paris, 1903); Ferry, *Discours et opinions* (ib., 1893-98); Hantoux, *Histoire de la France contemporaine* (4 vols., Eug. trans., 1903); G. Weill, *Histoire du parti républicain en France* (Paris, 1900); A. Debidous, *L'Eglise catholique et l'état de 1870-1906* (2 vols., ib., 1906).

FERRY, ORRIS SANDFORD (1823-75). An American legislator. He was born at Bethel, Conn., and graduated at Yale in 1844. He was a probate judge from 1849 to 1856, and a member of the State Senate from 1855 to 1857, as a member of the American party. He was elected a member of the Thirty-sixth Congress as a Republican in 1859 and formed one of the celebrated Committee of Thirty-Three, organized to consider the condition and relation of the seceded States. In July, 1861, he recruited and became colonel of the Fifth Connecticut Volunteer Infantry, and he was commissioned a brigadier general of volunteers by President Lincoln March 17, 1862, in which capacity he served to the close of the war. In 1866 he was elected to the United States Senate as a Republican, but his independence, and his opposition to the Civil Rights Bill in particular, threw him out of line with his party, and he was reelected in 1872 by a combination of Liberal Republicans and Democrats, defeating General Hawley, the regular Republican candidate. He continued to act with the Republicans, however, and supported the Grant administration, taking a leading part in framing the legislative acts that provided for carrying out the President's policy.

FERRY, FÉLIX, PAUL (1591-1609). A French clergyman, who was born at Metz and spent his entire life there. He was the author of a number of unimportant works. A certain interest attaches to a correspondence he had with Bossuet (1606-67) upon the reunion of the Protestant and Catholic churches. His *Catéchisme général de la réformation de la religion* (1654) provoked a refutation from Bossuet. He is said to have received a pension from Richelieu for agitating this question.

FERRY, THOMAS WHITE (1827-90). An American Republican politician, born in Mackinac, Mich. He was a member of the State Legislature for some time and from 1865 to 1871 was a member of the House of Representatives. He then served in the United States Senate for two terms, acting for much of the time as President pro tempore, and, on the death of Henry Wilson, was President of the Senate in 1875-77.

FERRYLAND. An old-time port of entry, capital of Ferryland District, Newfoundland, 34 miles south of St. John's (Map: Newfoundland, II 5). It has a fine harbor and lighthouse. As Avalon, it was founded in 1624 by Sir George Calvert, afterward Lord Baltimore, and here in 1638 Sir David Kirke held the court of a count palatine with powers over the whole island. Ruins of the ancient fort exist. Its development was arrested by troubles with the French. Pop., 1901, 535.

FERSEN, FÆRSEN, FREDRIK AXEL VON (1719-94). A Swedish soldier and statesman, born at Stockholm and descended from the Scottish McPhersons. He served in the French army

from 1740 to 1748 and was promoted to the rank of major general. As a lieutenant general of Sweden he served in the Seven Years' War and conquered the islands of Usedom and Wollin. In 1770 he became field marshal. Thereafter he was an important factor in the politics of Sweden, especially as a leader of the "Hats," until, as the centre of the opposition of the nobles to Gustavus III, he was apprehended in the Riksdag of 1789 and compelled to retire from politics. He was a member of the Swedish Academy founded in 1768. His *Historiska Skrifter* (Stockholm, 1867-72), largely autobiographical, are interesting, but not always unbiased.

FERSEN, HANS AXEL, COUNT (1755-1810). A marshal of Sweden and the son of the preceding. He studied at the Turin military academy, and, after serving in the Swedish army, became colonel of the regiment called Royal Suédois at the court of Louis XVI, where he was a conspicuous figure in the social life and a favorite of the Queen. From 1780 to 1783 he served with Rochambeau in America. Out of devotion for Marie Antoinette, he accompanied the royal family in their flight to Varennes and labored for their welfare after their capture, even to the extent of risking his own safety in returning to Paris to plan their escape from prison. Returning to Sweden in 1793, he was made marshal, chancellor of the University of Upsala, and was sent as plenipotentiary to the Congress of Rastadt. When the Crown Prince of Sweden died suddenly in June, 1810, the people, who hated Fersen, accused him of having poisoned the Prince and, seizing him in the town hall, to which he had been taken, murdered him (June 20, 1810). His complete innocence was subsequently established. Consult: Klinckowström, *Le comte de Fersen et la cour de France* (Paris, 1877); Graudat, *Un ami de la reine* (ib., 1892); Fach, *Graf von Hans Axel von Fersen* (Stockholm, 1896).

FERTILIZATION (from Lat. *fertilis*, fertile, from *ferre*, to bear, Gk. *φέρειν*, *pherein*, Skt. *bhar*, Goth. *bairan*, OI.G., A.S. *beran*, Eng. *bear*). In plants, the fusion of two sexual cells, or gametes (q.v.). This process, sometimes called "fecundation," is exhibited in the life histories of most plants. Gametes are present in all plants, excepting the lower forms. The possible derivation of gametes has been suggested by the life histories of certain algae, as *Ullothrix*, in which there is an evident relationship between gametes and the ordinary asexual swimming spores. It is probable that gametes have in general been derived from asexual spores, and it is not surprising that they occasionally germinate as asexual spores. In the simplest cases of fertilization the gametes are similar, so that there is no apparent distinction of sex. In this case the process is often called "conjugation," and plants which exhibit it are known as "isogamous" plants. Almost all plants, however, are "heterogamous"; i.e., the pairing gametes have become so different that a distinction of sex is plainly evident. In heterogamous plants the male gamete is known as the "sperm," and the female gamete as the "egg," and fertilization in its restricted sense is the fusion of sperm and egg. Along with the differentiation of gametes has occurred the differentiation of sex organs (gametangia), those developing sperms being called "antheridia," those developing eggs being called "oögonia," or "archegonia." The

result of fertilization is the formation of a spore which is in all plants technically the "oöspore," or fertilized egg. To distinguish the result of conjugation from that of ordinary fer-

FERTILIZATION.

1, sex organs of *Vaucheria*; 2, conjugation of two ciliated gametes; 3, a large egg surrounded by numerous sperm; 4, antheridial tube entering egg of *Cystopus*; 5, sperm entering archegonium of a liverwort.

tization, the name "zygospore" is commonly substituted for "oöspore." Among seed plants a single free egg is developed within the embryo sac, and within the pollen grain certain cells are developed which are called "male cells," and which are sperms in function.

One of the chief features in connection with the process of fertilization is the method by which the pairing gametes are brought together. In conjugation the two gametes have similar powers, and in the majority of cases are motile bodies, usually swimming by means of cilia.

DOUBLE FERTILIZATION IN LILY.

a, fusion of sperm and egg; b, fusion of sperm with two polar nuclei.

In some cases in the lower forms the gametes are brought together by the development of a tube which bridges the space between the sex organs. In heterogamous plants the sperm is

always the active gamete and finds its way to the egg, which remains quiescent. Among the higher algae, mosses, and ferns the sperm is, as a rule, a free-swimming ciliated cell, and is attracted to the oögonium, or archegonium, by various chemical substances which are secreted in connection with the female sex organ. One of the distinguishing marks of the seed plants, however, is that the sperm ceases to be a motile body and is ordinarily transferred from the pollen grain in which it is produced to the egg by means of a tube called the "pollen tube." This tube in gymnosperms (pines, etc.) penetrates the tissues of the ovule lying above the embryo sac, and in the angiosperms (flowering plants) it passes through the style, enters the ovary, and finds its way to the ovule. It is an interesting fact that in the Cycadales (q.v.) and Ginkgoales (q.v.) ciliated sperms have been discovered, which indicates that the old free-swimming habit of the sperm had not been entirely abandoned with the introduction of pollen tubes. In fact, all of the ancient gymnosperms are known now to have had swimming sperms.

While the passage of the sperm to the egg may be included under fertilization, the real act of fertilization consists in the fusion of the two naked cells. Just what happens in this fusion may be illustrated by the process of fertilization in the seed plants. Each gamete is a naked cell consisting of a nucleus about which there is organized cytoplasm. In the sperm the nucleus is very prominent and the cytoplasm relatively scanty. In the egg the nucleus is also prominent, but the cytoplasm is abundant and contains a rich supply of food reserve. In the seed plants it has been observed that the pollen tube approaches the egg and discharges a male cell into the cytoplasm. The nucleus of the male cell then slips out of its cytoplasm as out of a sheath and moves through the cytoplasm of the egg towards its nucleus. The male cytoplasm has thus been left behind in the egg cytoplasm, and it is not clear that the fusion of the two holds any important relation to the act of fertilization. In any event, the most evident fact in fertilization is the approach of the male nucleus to the female nucleus, and the fusion of the two. Just what this fusion involves, and how complete it is, is not clear. The nuclei are exceedingly complex structures, and just how far the corresponding structures of the two nuclei fuse in this process is very uncertain. In certain seed plants, as in gymnosperms, it has been observed that the two sets of chromosomes, which are thus brought together by the fusion of the two nuclei, do not fuse for some time and in some cases for several cell generations. It is evident, therefore, that the fusion does not necessarily involve a fusion of the chromosomes of the nuclei, which are regarded as probably the essential structures. The whole subject remains somewhat vague as to details, but the general fact that fertilization involves the fusion of two cells, and that in this fusion the two cytoplasms and the two nuclei take part, is well made out. The significance of the male cytoplasm, whether it simply acts as a carrier of the nucleus or is an essential feature in the fusion, and the details of nuclear fusion, whether it is a complete pairing of all of the structures which belong to the nuclei or not, are questions which investigation has not yet

settled. See CELL; GAMETES; and articles on the various groups of plants mentioned above.

FERTILIZATION OF FLOWERS BY INSECTS. See CROSS-FERTILIZATION; FLOWERS AND INSECTS; POLLINATION.

FERTILIZERS. In agriculture, a generic term for substances added to soil to increase the growth of crops. In its more restricted sense it embraces only such materials as have passed through some process of manufacture and are known as commercial fertilizers. These include many inorganic materials, such as potassium sulphate and chloride, ammonium sulphate, sodium nitrate, phosphatic rock in various prepared forms, and also many organic substances, such as ground bone, fish, tankage, ground-oil cakes, etc. For more detailed treatment, see MANURES AND MANURING.

FERUMBRAS, SIR. The hero of an English translation of *Fierabras*. See FIERABRAS.

FESCENNIA, or FESCENNIAN. See FESCENNINE VERSES.

FESCENNINE VERSES (Lat. *Fescennini [versus]*, or *Fescennina*). A branch of the indigenous poetry of ancient Italy. They were dialogues in rude extempore verses, generally in Saturnian measure, in which the participants rallied and ridiculed one another. They formed a favorite amusement of the country people on festive occasions, especially at the conclusion of harvest and at weddings or at triumphs. As was to be expected, they often degenerated into licentiousness, that at last required the curb of the law. The Fescennine verses are usually considered to have been of Etruscan origin and to have derived their name from the Etrurian town Fescennium (Fescennia). The name may, however, be connected rather with *fascinum*, fascination, enchantment, or the evil eye, against which the chanting of verses may have originally been intended as a protection. The Fescennine verses, in sophisticated form, were long written, as, e.g., by Catullus, lxi, 120 ff. (Consult Ellis's notes there.) Such Fescennines, too, were written by Claudianus (q.v.). Consult Schanz, *Geschichte der römischen Literatur*, vol. i, § 9 (3d ed., Munich, 1907), and Knapp, *American Journal of Philology*, xxxiii, 146-148 (New York, 1912). See SATIRE.

FESCH, JOSEPH (1763-1839). (Cardinal Archbishop of Lyons and maternal uncle of Napoleon I, born at Ajaccio, Corsica. He was destined from the first for the church and received a careful education in the seminary at Aix, becoming a priest shortly before 1789. During the Revolution, however, Fesch served as commissary of war under his illustrious nephew, in Italy, up to 1799. On the inauguration of the Consulate Fesch resumed his clerical habit, and was instrumental in bringing about the Concordat of 1801 with Pius VII. As a result of his activity, he was made Archbishop of Lyons the year following and in 1803 received the Cardinal's hat. In 1804 he successfully negotiated the matter of the consecration of the Emperor by the Pope at Paris and assisted at the coronation in Notre Dame. As a reward for the success of this difficult negotiation, he was made Grand Almoner of France, was granted the grand cordon of the Legion of Honor, and appointed member of the Senate. In 1806 Fesch was appointed, by Dalberg, Prince Primate of the Confederation of the Rhine, as his coadjutor and successor. In 1809 he declined the archbishopric of Paris, and soon

showed himself an opponent of Napoleon's policy with regard to the papacy. Finally, in 1810, at the French ecclesiastical council at Paris he stood out in open opposition to the Emperor. Sent in disfavor to his diocese, Fesch attempted to communicate with Pius VII, but his letter was discovered, and he fell into open disgrace. In 1814 Fesch retired to Lyons, but reappeared during the Hundred Days, returned to his diocese, and was made a member of the House of Peers by Napoleon. Banished by the Bourbons, he retired to Rome in 1815 and passed the rest of his life in luxurious retirement, leaving his diocese to be administered by a vicar. He died in Rome, May 13, 1839. Consult his "Correspondance," in Du Casse, *Histoire des négociations diplomatiques* (Paris, 1855); Lyonnet, *Le cardinal Fesch* (Lyons, 1841); Ricard, *Le cardinal Fesch* (Paris, 1893); Welschings, *Le pape et l'empereur* (ib., 1905).

FESCUE (corrupt. of *festu*, OFr. *festu*, Lat. *festuca*, straw, stalk). *Festuca*. A genus of grasses, very nearly allied to brome grass (q.v.). The species are numerous and are very widely diffused over the world, both in the Northern and Southern hemispheres. Among them are many of the most valuable pasture and fodder grasses. Tall or meadow fescue (*Festuca elatior*), a species from 2 to 4 feet tall, common in moist meadows and pastures of rich soil in Great Britain and throughout Europe, in northern Asia, and in some parts of North America, is perhaps excelled by no meadow or pasture grass whatever. It is suitable both for meadows and for permanent pasture. *Festuca pratensis*, by many botanists regarded as a variety of meadow fescue, is an excellent grass for rich moist meadows. Hard fescue (*Festuca duriuscula*, sometimes classed as a variety of *Festuca ovina*), known by various other synonymous names, a grass from 1½ to 2 feet tall, with a somewhat contracted panicle, mostly on one side, is well adapted for lawns and sheep pastures, particularly on dry or sandy soils. Several varieties are known to seedsmen and farmers. Creeping fescue, or red fescue (*Festuca rubra*), is distinguished chiefly by its extensively creeping root, which particularly adapts it to sandy pastures and to places liable to occasional inundations. It has many recognized varieties. Sheep's fescue (*Festuca ovina*) is a smaller grass than any of these, not generally exceeding a foot in height and often much less, abundant in mountainous pastures and especially suitable for such situations, in which it often forms a principal part of the food of sheep for many months of the year. It is common in all the mountainous parts of Europe and in the Himalayas and is also a native of North America. Species very similar to this, if not mere varieties of it, abound in the Southern Hemisphere. Its habit of growth is much tufted. Of species which have been introduced into cultivation in the United States and Great Britain, *Festuca heterophylla*, referred by some authors to various other specific names, deserves notice. It is a tall species with narrow root leaves and broad leaves on the culm. It is a native of France and other parts of the continent of Europe and is pretty extensively cultivated in some countries, particularly the Netherlands. A number of species abound in the western United States, where they are important constituents in the range pastures. All these species are perennial. Some small annual species occasionally

form a considerable part of the pasture in dry, sandy soils, but are never sown by the farmer. A Peruvian species, *Festuca quadridentata*, called "pigouil" in its native country and there used for thatch, is said to be poisonous to cattle.

FESS (OF. *fesse*, Fr. *faisse*, *fasse*, *fesse*, from Lat. *fascia*, bundle). In heraldry (q.v.), one of the charges known as ordinaries. See Plate of HERALDRY.

FES/SENDEN, REGINALD AUBREY (1866-). An American electrician, born at Milton, Quebec Province, Canada. From 1887 to 1890 he was head chemist of the laboratory of Thomas A. Edison, the inventor; from 1890 to 1892 an electrician with the Westinghouse Company of Newark, N. J., and in 1892-93 professor of physics and electrical engineering in Purdue University (Lafayette, Ind.). In 1893-1900 he was professor of electrical engineering in the Western University of Pennsylvania (Allegheny, Pa.). From 1900 to Aug. 31, 1902, he was a special agent of the United States Weather Bureau, in charge of investigations in wireless telegraphy as an aid to the collection of daily weather reports.

FES/SENDEN, THOMAS GREEN (1771-1837). An American writer. He was born at Walpole, N. H., and graduated at Dartmouth in 1796. He was for some time in London engaged in an enterprise which ruined him financially, and while there advertised the metallic tractors of Benjamin D. Perkins (q.v.) in a grotesque poem entitled *Terrible Tractation* (1803), a satire upon the medical profession which opposed the use of the instruments. In 1822 he started in Boston the *New England Farmer*, with which he was connected until his death. For two years he was editor of the *Weekly Inspector* in New York City. Among his further works are: *Pills, Poetical, Political, and Philosophical, Prescribed for the Purpose of Purging the Public of Piddling Philosophers, Penny Poctasters, of Paltry Politicians, and Petty Partisans*, by Peter Pepperbox, Poet and Physician (1809); *Democracy Unveiled* (1806); *The Complete Farmer and Rural Economist* (1834; 4th ed., 1839); *The American Kitchen Gardener* (1856). Consult Hawthorne, *Fanshawe, and Other Pieces* (Boston, 1876).

FESSENDEN, WILLIAM PITT (1806-69). An American statesman. He was born in Boscowen, N. H., graduated at Bowdoin College in 1823, and began the practice of law in 1827. He settled in Portland, Me., was elected to the State Legislature in 1832, and became known as an able debater. From 1840 to 1843 he served in the national House of Representatives as a Whig. At the end of this term he devoted himself to the practice of law, winning national repute in his profession and as an antislavery Whig orator and campaign speaker. In 1848 he was a strong supporter of Webster for the presidency. In 1854, while a member of the Maine Legislature, he was elected United States Senator by the combined votes of the Whig and antislavery Democratic members. A fortnight after taking his seat in the Senate, he delivered a stirring speech in opposition to the Kansas-Nebraska Bill, thereby leaping at once into prominence as one of the ablest speakers on the antislavery side. In 1850 he was reelected to the Senate for a second term as a Republican and was at once made chairman of the important committee on finance, in which position during the next five years he ably seconded

President Lincoln and Secretary Chase in their attempts to solve the puzzling financial questions arising from the war. Upon the resignation of Secretary Chase in 1864, President Lincoln and his counselors turned to Senator Fessenden as the man best fitted to take the vacant portfolio of the Treasury. Fessenden hesitated at first, but after it became evident that there was need of his services and that both President and nation looked to him in the emergency, he accepted. The period was one of the blackest in the financial history of the country. Gold was at 280, the currency of the nation was inflated, the paper dollar was worth only 34 cents, and the government had just found it necessary to withdraw from the market a loan which it had been unable to float. The first act of the new Secretary in this crisis was the issuance of the famous "seven-thirty" bonds—bonds bearing interest at the rate of 7.30 per cent and issued in denominations as small as \$50. His idea was that, if appeals were made to the patriotism of the people, and the loan offered in such sums that people of moderate means could invest, it would succeed, and his judgment proved correct. He also withheld the further issue of greenbacks for the time being, thus inducing the State banks to adopt the national system. Gold having fallen to 199 and the necessities of the occasion having been met, Secretary Fessenden resigned his portfolio in March, 1865, in order to take his seat in the Senate, to which he had been chosen for a third term. In the years immediately following the war he took a leading part in the debates and was chairman of the joint committee on reconstruction. His action in voting for the acquittal of President Johnson on his impeachment trial brought upon him the harshest criticism of his political career. He faced bravely the storm of reproach which it called forth, and although for the moment his political associates looked upon him as almost a traitor, his sincerity and honesty of purpose were so apparent, and his continued devotion to the principles of the Republican party so absolute, that he very soon won again his old position as a party leader. Consult Francis Fessenden, *Life and Public Service of W. P. Fessenden* (2 vols., Boston, 1907).

FESSLER, FES'LER, IGNAZ AURELIUS (1756-1839). A well-known Hungarian historian and ecclesiastic. He was born at Czuredorf and educated at Pressburg and Raab. He was successively a Capuchin monk in Vienna, professor of hermeneutics at Lemberg, a Protestant and Freemason at Berlin, a lecturer on philosophy at St. Petersburg, a government official at Saratov, and, lastly, general superintendent of the Lutheran Community of St. Petersburg. His departure from Austria was due to persecution at the hands of the church for having denounced the monks to Joseph II. He wrote several historical novels (*Marc Aurel*, *Matthias Corvinus*, *Attila*) now well-nigh forgotten; a historical work, *Die Geschichte der Ungarn und deren Landsassen* (10 vols., Leipzig, 1815-25); and a curious autobiographical sketch, *Rückblicke auf meine Siebzugjährige Pilgerschaft* (Breslau, 1824). He died at St. Petersburg, Dec. 15, 1839.

FESSLER, JOSEPH (1813-72). An Austrian Roman Catholic theologian, born at Lochau in the Crownland of Vorarlberg, of a peasant family. He studied at Innsbruck and the Seminary of Brixen, was ordained priest in 1837,

in 1841 was appointed instructor in Church history at Brixen and in 1843 in canon law also. He was elected to the Frankfort Parliament in 1848, received appointment to the chair of Church history at Vienna in 1852, and was transferred to that of canon law in 1856. In 1861-62 he was a member of the Congregation for the Oriental Rites at Rome; he became in 1864 Bishop of St. Pölten and in 1869 general secretary of the Vatican Council. His most important work is his *Institutiones Patrologiae* (1850-51; new ed. by Jungmann, 1890-96). He also wrote a *Geschichte der Kirche Christi* (4th ed., 1877), and on the infallibility of the Pope, *Die wahre und die falsche Unfehlbarkeit der Päpste* (1871), a reply to Schulte's *Das vaticanische Concilium*, in which Fessler holds, like Newman, that papal infallibility is confined to cases in which the pontiff exercises the prerogative. Consult the biography by Erdinger (Brixen, 1874).

FESTA, CONSTANZO (c.1490-1545). An Italian singer and composer, celebrated as the forerunner of Palestrina. He was born probably in Rome, where in 1517 he entered the pontifical chapel as a singer and contrapuntist. He was very soon appointed maestro in the Vatican and retained his position until his death. Only a few of his numerous masses, motets, madrigals, and litanies have been printed. His *Tc Deum*, published in Rome in 1596, is a composition of remarkable beauty and is still sung at the Vatican at Corpus Christi and on other solemn occasions. Several of the works of Festa are preserved in the archives of the Vatican and in the collections published by Giardano and Scotto (sixteenth century). Festa is generally regarded as the first great composer of the Roman school.

FES'TE. Olivia's clown in Shakespeare's *Twelfth Night*. He joins in the plot against Malvolio, and some of the author's best lyrics are sung by him.

FESTIN DE PIERRE, fës'tän' de pyâr'. See DON JUAN.

FESTIN'IOG. A town and railway junction in Merionethshire, Wales, 8½ miles east-northeast of Portmadoc (Map: Wales, C 4). It is situated amid picturesque mountain scenery and is noted for its slate quarries, which give employment to most of its inhabitants. Pop., 1901, 11,400; 1911, 9680.

FESTIVAL PLAYS. See MYSTERIES.

FESTIVALS (OF., Fr. *festival*, from ML. *festivus*, from Lat. *festivus*, festive, from *festum*, feast), or **FEASTS**. Days or seasons set apart for public rejoicing and rest from ordinary labor, at stated intervals, or occasionally for religious purposes solely, or for the celebration of some person or event. Originally all festivals were of a religious character, since eating, drinking, and other pleasures connected with them could not be indulged without sharing these enjoyments with the divinities. The earliest of all festivals seem to have been connected with the cult of the dead. At great banquets communion was held with the departed spirits, and offerings were made to them. As clans grew and became scattered, such common meals could only be arranged occasionally. When the great luminaries began to attract worship and the ancestral spirits were in some way connected with them, these banquets were held annually or monthly. While purely animistic festivals are still observed in different

parts of the world, when food and drink are offered to the dead at their burial places, in the vast majority of instances the primitive significance has been obscured or wholly obliterated by a superinduced reference to natural phenomena or historic events. Wandering tribes are greatly attracted by the changing phases of the moon, and the festivals characteristic of the nomadic state are chiefly lunar. When men settle down to agricultural life, they become dependent on sunshine and rain; winter and summer, seedtime and harvest, equinoxes and solstices, become the occasions for festivities. With the development of a more complex social organization and the rise of great empires, the interest in national self-preservation becomes acute, and the feasts assume a political character as celebrations of deliverance and victory. Veneration of the great religious leaders who have deeply impressed a people's life, leads to the setting apart of certain days in their honor. But whatever new significance is added to an earlier festival, something of its old character is likely to adhere to it. The god who sleeps during the winter and is awakened from his slumber at the vernal equinox has much in common with the ancestral spirit to whom new vitality is given by a libation of blood, and it is natural that the celebration of those mighty beings whose changing fortunes and all too human experiences were seen portrayed in the ceaseless play of nature's forces, should borrow a feature from the banquets in honor of the departed dead. Fellowship with and likeness to the spirits associated with the elements of nature are sought in more exacting cultic performances. In solemn mimicry and self-inflicted pains the acts and sufferings of the deity are imitated. Sympathy with the solar divinity as well as with his mother and his spouse in the loss of generative power and the recovery of reproductive strength is expressed by the worshiper in self-imposed impotence and sterility or unrestrained sexual abandonment. Songs, shouts, dances, and processions, simple scenic representations, and ultimately the drama are the results of such symbolic actions. When historic personalities and events begin to be celebrated, the character of the gods is apt to be transferred to the heroes, and the divine experiences blend with the human. This is especially the case with the great religious leaders, whose apotheosis is most natural.

The festivals celebrated by the ancient Toltecs and Aztecs of Mexico, and the Incas of Peru, while retaining features of ancestor worship, were for the most part of a solar and lunar character. The Mexicans had their chief feasts in May, June, and December. The Peruvians, besides the new moons, also celebrated the summer and winter solstices and the equinoxes. The Chinese have a very elaborate system of festivals. Of these the most important is the one celebrated in honor of the dead at the winter solstice. Even the Buddhists of China have their feasts commemorating the birth of Gautama Buddha, his departure from home, and his entrance into Nirvana. The Karens have an annual feast in honor of the departed, while the Nagas of Assam make their offerings to the dead each moon. In Siam the 8th and 15th of every month are considered sacred. From the Yajur-Veda period to the present day numerous feasts have been observed in India. The Hali at the vernal equinox and the Dasahara in the

autumn are mentioned as early as Aitareya Brahmana. In honor of Vishnu, Siva, and Indra, the Ganges, and the goddess Kali, festivals are still held. The ancient Persians had four solar feasts, at the solstices and the equinoxes, an annual funeral feast in February, a celebration of the five intercalary days, and several festivals to which a historic significance was given, as celebrations of victories like that of Iran over Turan and of Feridun over Zahak. The Fravardigan, or New Year's Feast, had distinctly animistic features. With the Mithra cult its great feast on the 25th of December passed to Asia Minor and the West. The Asianic peoples seem to have had their festivals at the equinoxes. Thus, the Phrygians celebrated the sleep and the awakening of the sun god in the fall and the spring. The intense worship of the mother goddess in Asia Minor no doubt influenced profoundly the festivals of the Ionian Greeks.

In Greece each demos had its peculiar calendar. But the *éortē*, or new-moon feast (*Odyssey*, xx, 156), was probably kept very generally in earlier times. A harvest festival, and an ancestral feast in honor of Erechtheus also go back to a high antiquity (*Iliad*, ix, 533: ii, 550). The Athenian calendar which is best known contains one or more festivals each month. In January the *Lenæa*, or wine-press feast, in honor of Dionysus was celebrated (see BACCHUS); in February, the *Anthesteria* of Dionysus, the *Diasia* of Zeus, and the lesser *Eleusinia* (see ELEUSINIAN MYSTERIES); in March, the *Pandia* of Zeus, the *Elaphebolia* of Artemis, and the greater *Dionysia*; in April, the *Munychia* of Artemis and the *Delphinia* of Apollo; in May, the *Thargelia* of Apollo and the *Plynteria* and *Callynteria* of Athens; in June, the *Dipolia* of Zeus and the *Scirophoria* of Athens; in July, the *Cronia* of Cronus and the *Panathenæa* (q.v.) of Athens; in August, the *Metageitnia* of Apollo; in September, the *Boēdromia* of Apollo, the *Nemeseia*, and the greater *Eleusinia*; in October, the *Pyanepsia* of Apollo, the *Oschophoria* of Dionysus, the *Athenæa* of Athens, the *Thesmophoria* of Demeter, and the *Apaturia*; in November, the *Maiaktēria* of Zeus; and in December, the lesser *Dionysia*. The *Nemeseia* was an ancestor feast; historic associations clustered about other festivals, while still others were nature feasts. Great significance was acquired by the national feasts, of which the games and dramatic performances became the leading attractions. See ISTEMUS; NEMEA; OLYMPIA; OLYMPIAD; OLYMPIC GAMES; PYTHIAN GAMES.

As in Greece, so in Italy, the festivals were in earlier times comparatively few in number. Among them were distinctly animistic feasts, such as the *Lemuralia* and the *Feralia*. The Roman receptivity to foreign religious customs subsequently led to a great increase and a constant fluctuation in their number. At the beginning of the Christian era the most important were the following: In January, New Year's Day, the *Agonalia* and the *Carmentalia*; in February, the *Faunalia*, the *Lupercalia*, the *Quirinalia*, the *Feralia*, the *Terminalia*, the *Fugalia*, and the *Equiria*; in March, the *Matronalia*, the *Liberalia*, and the *Quinquatrus*; in April, the *Megalesia*, the *Cerealia*, the *Palilia*, the *Vinalia*, the *Robigalia*, and the *Floralia*; in May, the *Lemuria* and the *Ludi Martiales*; in June, the feast of *Semo Sancus*, the *Vestalia*,

and the *Matralia*; in July, the *Apollinaria* and *Neptunalia*; in August, the *Nemoralia*, the *Consualia*, the *Vinalia Rustica*, and the *Vulcanalia*; in September, the *Ludi Magni* in honor of Jupiter, Juno, and Minerva; in October, the *Meditrinalia*, the *Faunalia*, and the *Equiria*; in November, the *Epulum Jovis*; and in December, the last *Faunalia*, the *Opalia*, the *Saturnalia*, and the *Larentalia*. Under the emperors the number of festivals increased to such an extent that at one time there were more feast days than days of work.

The Germanic nations had important festivals at the winter solstice and the vernal equinox, the Yuletide devoted to Frey, the Easter to the goddess Ostara, and there are also traces of neomenia. Evidence of original ancestor worship is found in connection with some Celtic and Slavonic feasts.

In ancient Egypt each nome had originally its own cycle of feasts, and the character of the festivities was determined by the nature of the divinity worshiped at its chief sanctuary. Lunar feasts in honor of the dead were apparently celebrated everywhere, and even the solar feasts were likely to be of an animistic character. Since the fertility of the soil depended wholly upon the inundations of the Nile, it is natural that its rising should be celebrated throughout the valley. Where worship of the solar deities forms so large a part of the religious life as in Egypt, and in the epic of the myths all other gods and departed spirits are brought into relation with them, it is natural that the life-producing energy of the sun should be bodied forth in symbolic acts. Sexual excesses were therefore apt to characterize especially the celebration of the great goddesses Neith, Nut, Hathor, and Isis. In later times, however, a pantheistic philosophy and a mystic mood seem to have given the Isis festivals a more spiritual character.

In Babylonia each great sanctuary also developed its own calendar. Extant inscriptions do not give a full account of any system; but it is evident that some of the greatest festivals, such as the Zakmuk, or New Year's feast at the vernal equinox, and the Sacra possibly at the summer solstice, were kept throughout the land. At the former the destinies of men were fixed for the coming year. It seems to have been a Marduk festival. A procession between the neighboring shrines of Babylon and Borsippa took place at this time, and the King "seized the hands of Bel," by which ceremony he was formally installed as vicegerent of the god during the year. According to Berossus and Strabo the Sacra had a Dionysiac character, and among the enjoyments it furnished was the crowning of a condemned criminal as mock king. For five days he had full license and then was disrobed, scourged, and impaled. The five days are probably the *humustu*, or intercalary days. At certain Ishtar feasts women sacrificed their virginity or offered themselves for the benefit of the goddess, according to Greek writers. A special significance seems to have been attached to the 7th, 14th, 19th, 21st, and 28th days of the month, according to an ancient calendar. The term *shabbatum* is explained in a lexical tablet as "day of the rest of the heart." It is therefore possible that the name of the Sabbath is of Babylonian origin as a day when the heart of the gods was pacified by sacrifice. But we now know that *shabbatum* in reality was the

designation of the 15th day of the month and meant "full moon," and it is altogether probable that in earlier times *sabbath* meant "full moon" also in Israel. (Consult Jastrow, *Hebrew and Babylonian Traditions*, New York, 1914.) Whether it was observed by the ancient Canaanites and Phoenicians cannot be determined. (See SABBATH.) The clearest testimony concerning their festivals is found in the Hebrew records, since it was from these Semitic peoples that the invaders borrowed the agricultural festivals. The license that prevailed at the Ashtaroth and Adonis festivals is vouched for by many witnesses.

While South Arabian inscriptions are beginning to clear up the history of the peninsula before Mohammed (see MINAEANS; SABAENS), we are still dependent upon Islamic writers for our knowledge of the festivals that were kept in that period. In spite of their misapprehensions it is possible to discern the fact that the great festivals of the Muslim calendar are adaptations of pagan feasts, and even the manner of celebration is certainly a continuation of the old traditions. The great feast of ancient Arabia was in the spring, in the month called Rajab, during which, on account of this festival, cessation of hostilities between the tribes was ordained. This sacred season was originally fixed at the beginning of the summer, but the ignorance of astronomy in the earliest time, and the insistence upon a lunar year, caused the months to recede from year to year. At this time the firstlings were offered. Muharram was the first winter month, and its beginning marked the New Year with a festival at the autumnal equinox. The first 10 days of the month are considered sacred by the Shiites and observed in commemoration of the martyrdom of Husain. (See MOHAMMEDAN SECTS; HASAN AND HUSAIN.) The 10th of the month is generally observed throughout the Muslim world. The birthday of the Prophet in the third month is kept, and the 27th of the seventh month in commemoration of his supposed miraculous ascent to heaven. The first three days of Shawwal, the tenth month, constitute the "minor festival." It follows immediately upon the end of the fast of Ramadan (the ninth month) and is a time of general rejoicing after the rigors of this season. (See RAMADAN.) On the 10th of Dhu'l Hijjah (the day of the sacrifice at Mecca; see HAJJ) begins the "great festival," lasting three or four days. The departure and return of the pilgrimage are also occasions of ceremony and rejoicing. Many other days have a local observance in honor of some great man or event. The method of keeping a Mohammedan holiday varies greatly. Public processions are often a prominent feature. Friday (el-Jumrah) is frequently called the Mohammedan Sunday. It is the great day for public gathering at the mosque, but has no other point of resemblance to the Christian holy day.

Before their invasion of Palestine the Hebrew tribes seem to have had one important annual festival, the Passover (q.v.). This *Pesach*, or leap feast, so called probably from the gamboling of the young, was celebrated about the time of the vernal equinox, apparently by each household offering the firstlings of its flocks and herds. The recipients of these sacrifices may have been the household gods (*Elolhim*), as even after the settlement in Palestine, when the people lived in houses and no longer in tents,

they seem to have smeared the blood upon the threshold and the doorposts, where these guardian spirits were conceived to have their abode. It is probable that the festival of the new moon was also celebrated in this period; and the Feast of Sheep-Shearing may be of equal antiquity (1 Sam. xxv. 2; 2 Sam. xiii. 23). When the different tribes had settled down to agriculture, they naturally learned of their new neighbors how to celebrate properly the harvest feasts, until then unknown to them. The great agricultural feasts were three in number. At the Feast of Unleavened Bread (called *Hag ham-mazoth*, from *hag*, a dance, a pilgrimage, a festival, and *mazoth*, cakes) the first fruits of the barley harvest were presented to the local Baal or to Yahwe. Seven weeks later the Feast of Weeks was observed (*Hag shabu'oth*, or *Hag haq-qasir*; *shabu'oth*, weeks; *qasir*, harvest), when the wheat crop had been gathered in. The time between these two feasts was a single festive season. In the autumn the Feast of Tabernacles came (*Hag has-sukkoth*, or *Hag asiph*; *sukkoth*, booths, tents; *asiph*, gathering, harvest), "the ingathering at the year's end." This was on the occasion of the vintage and the olive gathering. Its name was derived from the custom of living in groves and gardens in huts made of boughs. These booths were the scene of much merriment. Sacred dances were an important feature. At Shiloh the young maidens performed choral dances in the vineyards (Judg. xxi. 19 et seq.). Eli's suspicion of Hannah shows how freely the wine was used even by women on these occasions (1 Sam. i. 14). The denunciations of the prophetic prophets reveal the essentially Dionysiac and licentious character of these festivals at the great shrines. To such an extent were drunken orgies and sexual indulgences characteristic features of these feasts, that men like Amos and Hosea, Isaiah and Jeremiah, declared the sacrificial system and the temple cult contrary to the will of Yahwe. Concerning some early festivals our information is very scanty. Thus, the Jephthah festival in Gilead, at which a virgin apparently was sacrificed, may have been either in honor of a virgin goddess, or more probably of the divinity who opens the womb, in order to insure the fertility of the tribe (Judg. xi. 40). The centralization of the cult in Jerusalem and the attempted abolition of all sanctuaries outside of the capital in the reign of Josiah (637-608 B.C.) had a tendency at once to enhance the importance of the great festivals and to check the moral abuses associated with the rural feasts. But the destruction of Jerusalem and the end of the independent statehood of Judah naturally caused a revival of the local cults. That even some of the features most vehemently denounced by the prophets still continued in the fifth and fourth centuries B.C. is evident from Isa. lvi-lxvi. Having no temples, the exiles naturally put the more emphasis upon the keeping of the Sabbath, which was possible even in a foreign land. This had now ceased to be connected with the phases of the moon and fell on every seventh day. It is significant that the insistence upon reform in the observance of the Sabbath was first made in Jerusalem by men born in Persia, such as Nehemiah and Ezra. All festivals are in this period given a historic significance. The ecclesiastical legislation did not recognize them as nature feasts, but as celebrations of Israel's deliverance from

Egypt. New feasts appeared in the *Rosh hash-shanah*, or New Year's Day, and the *Yom Kippur*, or the Day of Atonement, on the 1st and 10th of the seventh month respectively. In the Maccabean period the Dedication Feast was introduced to celebrate the reconsecration of the temple of Yahwe, on the 25th of Chislew, 165 B.C., after it had been for three years a sanctuary to Zeus Olympius (1 Macc. iv. 59). It is not likely to be an accident, however, that this event was celebrated at the time of the winter solstice. The recovery of the temple about that time of the year rendered it possible to dedicate to Yahwe a festival widely celebrated by pagan neighbors and probably also by emancipated Jews. Similarly the feast of Nicanor on the 13th of Adar, in celebration of the victory of Judas Maccabæus at Beth-horon in 161 B.C., was apparently an adaptation of an earlier festival in honor of the dead (1 Macc. vii. 40; 2 Macc. xv. 36). Subsequently the Purim feast absorbed this Nicanor festival. The former seems to have been originally an Ishtar feast, celebrating the victory of this goddess and Marduk over the Elamitish divinity, Humba, conceived as a demon representing the nether world. In the Hebrew story told to commend the festival the names of the combatants in the Babylonian myth have been thinly disguised as Esther, Mordecai, and Haman, while in the actual celebration the ornamenting of the graves is most unimpeachable testimony to the worship of the dead once connected with it. As the Greek translation, according to the colophon, appears to have been made and brought to Egypt to introduce the Purim feast for the first time among the Jews living there in the year 45 B.C., the Book of Esther and the institution of the festival among orthodox Jews in Palestine cannot have been much older. Whether the feast of the capture of the Akra (1 Macc. xiii. 50-52), no longer celebrated in the time of Josephus, likewise grew out of a nature festival cannot be determined. Equally unknown is the origin of the Feast of Wood-Bringing (Josephus, *Bel. Jud.* ii, 17, 6) and of the Feast of the Rejoicing of the Law.

The attitude of Jesus to the feasts of His people seems to have resembled that of the earlier prophets. Concerning one of them only, the Sabbath, has His opinion been recorded. But His defense of His disciples when charged with breaking the Sabbath clearly reveals His position. "Man was not made for the sake of the Sabbath, but the Sabbath for the sake of man; therefore man has also authority over the Sabbath," is an assertion utterly at variance with the prevailing estimate of the day. Whether His last meal with His disciples was the paschal meal cannot be determined with certainty. These disciples no doubt continued to keep the Jewish festivals. Only as Christianity began to make converts outside of Judaism did the question of their observance become an important one. In the Epistle to the Galatians, Sabbaths, new moons, and other sacred days are regarded as shadows of the coming reality, and done away with in Christ, and the insistence upon Sabbath keeping is looked upon as a sign of apostasy from the liberty of the gospel. In the profound philosophy of the Fourth Gospel the festivals of the Jews find a symbolic interpretation. In Jewish-Christian circles, however, the Sabbath continued to be observed, as the *Apostolical Constitutions* and

the canons of the Council of Laodicea show. A second-century gospel fragment in Coptic indicates that even the Jewish Passover was kept by Christians in Egypt. But gradually a number of Christian festivals came into vogue. It is not known how early the first day of the week began to be celebrated in honor of the resurrection. There is no trace of such an observance in the New Testament. For neither 1 Cor. xvi. 2, where each person is bidden to lay by him, i.e., in his own house, as he is prospered, on the first day of the week; nor Acts xx. 7, where there is a breaking of bread on the last day of Paul's stay in Troas, as probably on the preceding ones; nor Rev. i. 10, where the Lord's Day may refer to the great judgment day, can be quoted as showing that the first day was distinguished from other days as having a sacred character. What day Pliny refers to in his letter to Trajan is uncertain. In Barnabas xv. 9 some kind of celebration may be implied in the words "therefore we rejoice in the eighth day on which Jesus rose from the dead and having shown himself ascended to heaven." The first evidence of religious services upon the first day, because on it "God made the world and Jesus Christ rose from the dead," is found in Justin Martyr's *Apology*, written in 150 A.D. Whether the "venerable day of the sun" was first associated with the resurrection through the Mithra cult cannot yet be determined; but Constantine's decree, by which it was made a holiday for the Roman Empire, is couched in language that presupposes its general recognition as a sacred day. (See SABBATH; SUNDAY.) Through the Quartodeciman struggle a separate Christian festival distinct from the Passover developed in the second century, even though the Easter ritual preserved many features of the Jewish festival. (See EASTER.) While Origen still speaks of Pentecost as the whole season of seven weeks following Easter, the celebration of the outpouring of the Spirit was in course of time placed at the end of this period. Clement of Alexandria is the first to mention the festival of the Epiphany. That of the Nativity was later. Both Jews and other nations were accustomed to celebrate the winter solstice. Christmas may therefore go back either to the Dedication Feast, to the Roman Saturnalia, or to the great winter festival of the Mithra cult. Subsequently it united with the Germanic Yule. The feast of the Ascension is not older than the fourth century. The great number of pagans entering the church at that time, and the new character of Christianity as a state religion, caused many combinations of old festivals with the new ones. In the beginning of the sixth century attendance at church was made obligatory at Easter, Christmas, Epiphany, Ascension, Pentecost, Nativity, and St. John, and later Annunciation, Purification, Assumption of the Virgin, Circumcision, Michael, and All Saints were added. Soon after, the ecclesiastical year was arranged in three cycles: Advent, Easter, and Pentecost. The process of assimilating pagan festivals still continued. According to the direction of Gregory the Great, feasts as well as temples were to be appropriated. Thus, the Yule of the Germanic peoples and the Holiada of the Slavs were merged into Christmas, the feast in honor of the goddess Ostara united with the Passover, the Slavonic Kupulo feast blended with the midsummer festival in honor of St. John the Bap-

tist, and the Celtic carnival and Brandon feasts continued under the Christian régime. The Greek church multiplied festivals in honor of the saints even faster than the Roman church. It instituted the special day for the celebration of all the saints of the old law. The Coptic church adopted seven great festivals: Christmas, Epiphany, Annunciation, Palm Sunday, Easter, Ascension, Pentecost. Towards the end of the Middle Ages earnest protests were made by leaders in the church as well as by dissenters against the increase of festal days, both for economic and religious reasons. The partial or complete cessation of work took a disproportionate amount of time from every form of labor, and in spite of religious observances and prohibition of certain amusements, the leisure and gayety of these days naturally had a tendency to lead to excesses of different kinds.

The modern tendency in the Roman Catholic church has accordingly been to reduce the number of holidays of obligation, i.e., those on which servile work is prohibited; not counting Sundays, there are only six in the year in the United States. On the other hand, there has been a great increase in the total number of festivals, with the development of certain devotions and the gradual enlargement of the calendar. They are divided ritually into doubles, semidoubles, and simples, the first being those in which the antiphons at lauds and vespers are doubled, and including doubles of the first and second class, greater and lesser doubles. Doubles of the first class are frequently accompanied by octaves, i.e., the seven days after the feast are kept with corresponding ritual observances.

The only feast day retained by all the churches of the Reformation was Sunday (q.v.). The Church of England made fewer changes in the calendar than any other, retaining in addition to Easter, Christmas, Ascension, and Whitsunday, Trinity Sunday, the Circumcision, the Epiphany, the Purification and Annunciation of the Blessed Virgin, the Nativity of St. John the Baptist, All Saints, St. Michael, and All Angels, feasts of all the Apostles and Evangelists. Lutheran churches retained the feasts of the New Year, Epiphany, Annunciation, Palm Sunday, Easter, Ascension, Pentecost, St. John the Baptist, and Christmas. At Easter, Pentecost, and Christmas two days are kept. Presbyterians and other reformed bodies recognized no holy day, except Sunday, which is regarded as the Christian Sabbath. The Westminster Assembly of 1645 declared that there is no warrant in the Word of God for any other festival.

At the time of the French Revolution an attempt was made to reform the calendar by substituting a 10-day week for that of seven days, and the celebration of other events, personalities, and virtues for those emphasized by the church. But it had no permanent success. The separation of church and state in the United States, and the principle of religious liberty widely recognized in Europe, during the last century have raised many new questions concerning the sacred days. Where civil society can no longer take cognizance of the conceived sanctity of any day, but only guarantee that no citizen shall be disturbed at any time in his religious exercises, new grounds must be found for legislation affecting holidays. While absolute cessation from labor cannot be enjoined without infringing upon the liberties of the in-

dividual, the duty of society to protect its weaker members has been invoked to justify legislative measures securing to all the privilege of periodic rest. In some countries the public libraries, museums, art galleries, and theatres are open on holidays; in others, the labor necessarily involved is urged as the reason for prohibiting all educational and artistic exhibits. It is held by many sociologists that, as only a regularly recurring period of rest and recreation seems to be required, all legitimate needs may be met, without interruption of the world's work, its educational opportunities, and its artistic enjoyments, by an alternation of working forces.

See CALENDAR; FAST.

FESTOON' (Fr. *feston*, ML. *festus*, festal garland, from *festum*, feast). In architecture, a sculptured wreath or garland of flowers, leaves, or fruit, bound with fillets or ribbons, frequently used as an ornament in Roman and Renaissance buildings. It owes its origin to the practice of decorating the altars and the victims of festal sacrifices with such garlands and ribbons and was first used in permanent sculptured form on the altars, suspended from the *bucranes* (q.v.), and was later applied to the decoration of temples. The festoon occurs along with bulls' heads on the frieze of the temple of Vesta at Tivoli. The festoons are often represented, both in Roman and Renaissance art, as borne by infant figures, as on the tomb of Ilaria del Caretto by Giacompo della Quercia (q.v.), instead of animals' heads.

FESTU'CA. See FESCUE.

FESTUS. A city in Jefferson Co., Mo., 30 miles southeast of St. Louis, on the Mississippi River, the Frisco Line and the Mississippi River and Bonne Terre Railroad (Map: Missouri, F 3). Its industries are influenced by the large deposits of silica sand in the neighborhood, which is of an unusually pure variety. There are manufactories of plate glass and glass bottles. The electric-light plant is owned by the municipality. Pop., 1900, 1256; 1910, 2550.

FESTUS. A dramatic poem by Philip James Bailey (1839).

FESTUS, PORCIUS. Procurator of Judea from 58 to 62 A.D., though as regards these dates, especially that of the appointment, there is considerable discussion. (See *NEW TESTAMENT CHRONOLOGY*.) Festus succeeded Felix (q.v.) and was in turn succeeded by Albinus. His term of office was not marked by any events of note beyond (1) the settling by the Emperor against the Jews of the dispute between the Jewish and Syrian inhabitants of Caesarea regarding their civic privileges—a dispute which had come over from the time of Felix, of whose removal from office, in fact, it had been the cause (see *FELIX*); and (2) the controversy between Agrippa II and the priests in Jerusalem regarding the wall erected at the temple to break the view of the new wing of Agrippa's palace—a controversy in which Festus took the side of Agrippa, but which was appealed to Rome by the priests, Festus dying before the decision was known. In both these events, but especially in the former, Jewish hostility to Rome was greatly inflamed, and feelings were aroused which played an important part in the closely following Jewish War of 66 A.D.

It was before Festus that Paul, who had been left a prisoner by Felix, had his final hearing. On this occasion Festus, for the sake of pleasing the Jews, sought to induce Paul to go to Jerusalem for trial, in opposition to which suggestion the Apostle appealed to the Emperor. This appeal resulted in Paul's deportation to Rome in the autumn of 58 A.D. (Acts xxv-xxvi). See *PAUL*.

FESTUS, SEXTUS POMPEIUS. A Latin lexicographer of the latter part of the second or third century of our era, and one of the most important ancient authorities we have on the Latin language. He made an epitome of the great work of Verrius Flaccus, *De Verborum Significatu*. This compilation, which was arranged alphabetically in 20 books, was still further abridged in the end of the eighth century by Paul, son of Warnefried, commonly called Paulus Diaconus (q.v.). The great work of Flaccus has unfortunately entirely perished, and of the abridgment made by Festus only a single manuscript, and that in a deplorably imperfect condition, has survived. It came from Illyria and fell into the hands of Pomponius Lætus, a distinguished scholar of the fifteenth century. It ultimately passed into the library of Cardinal Farnese at Parma and is now preserved at Naples. The work, in spite of all its imperfections, is a storehouse of knowledge on points of mythology, grammar, and antiquities. All previous editions of Festus were of little value compared with that of Müller (Leipzig, 1834; 2d ed., 1880), but this is now superseded by the later edition of Thewrewk de Ponor (Budapest, 1889), unfortunately never completed, and that of Lindsay (Leipzig, 1913). Consult Lindsay's *Præfatio*, and Teuffel, *Geschichte der römischen Literatur*, § 261, 5 (6th ed., ib., 1910).

FETI, really *SHENSHIN*, *AFANASY AFANASOVICH* (1820-92). A Russian lyric poet. He was born in the Government of Orel. Of noble parentage, he entered first the faculty of law and later that of philology in the Moscow University, completing the latter course in 1844. The following year he joined the army and served in the Russo-Turkish War of 1853-56.

Owing to difficulties with the family papers, he assumed his mother's name, Fet, under which he was known until 1874, when officially allowed to resume his real name, Shenshin. His first volume of poems, the *Lyric Pantheon* (1840), though well received at the time, was not very successful. Another collection of his verse which appeared 10 years later, however, met with considerable success. In 1860 he bought a country estate and became an agriculturist. Then for nearly two decades he only occasionally contributed articles on agriculture under the title *From the Country*. In 1877 he settled in the Government of Kursk and published a series of masterly translations of the Roman poets (Horace, Vergil, Catullus, Ovid, Tibullus, Propertius, Juvenal), translating also into Russian Goethe's *Faust* and Schopenhauer's *The World as Will and Idea*. In 1883 a third collection of his poems was published under the title of *Fires of the Night*. His *My Reminiscences* (2 vols., 1890) and *The Early Years of my Life* (a posthumous work) supply an abundance of biographical data.

FÊTE NATIONALE, fât nâ'syô'nâl'. The national holiday of France. Since 1880 the government has set apart July 14, the anniversary of the fall of the Bastille, as a day of national rejoicing. Military parades are held everywhere, public banquets and receptions, while every patriotic Frenchman decorates his house with the tricolor of the Republic. In 1892 a second fête nationale was officially decreed, the 22d of September, upon which day a republican form of government was established.

FETERITA, fêt-êr-ê'te. A variety of non-saccharine sorghum of the durra group, native to the Sudan. Its somewhat juicy stems are rather slender and vary from 4 to 7 feet in height. Under favorable conditions the plant readily produces suckers and branches which are later in maturing than the initial stems, thus causing unevenness in ripening. In habit of growth feterita differs from milo and white durra mainly in having erect heads and producing somewhat larger seeds. It ripens fully as early as dwarf milo and two to three weeks earlier than standard blackhull kafir and also compares favorably with these and other sorghums in drought resistance. The culture requirements are the same as for the grain sorghums generally. It is planted in rows 40 to 44 inches apart and from two to three weeks later than corn, to insure rapid sprouting of the seed, which requires a warm soil. The crop prefers a good, firm seed bed and may be planted with a lister or an ordinary corn planter. It is cultivated like corn and is also best harvested with the corn harvester and placed in shocks in the usual manner. When grown for grain and forage it is harvested just before the grain hardens, but when grown for the grain alone it should stand until the earliest heads are fully ripe. The heads are mowed from the stems and thrashed with an ordinary grain separator suitably adjusted. The forage is equal in value to that of milo, but not quite equal to that of kafir and the sweet sorghum. More than 50 bushels of grain have been produced per acre. Feterita was introduced into the United States by the United States Department of Agriculture in 1906.

FETI, fî'tâ, *DOMENICO* (called *MANTUANO*, from the fact that his chief works were executed at Mantua) (1589-1624). An Italian

painter, born in Rome. He was a pupil of Lorenzo Cardì, called Cigoli. Ferdinand Gonzaga, Duke of Mantua, appointed him court painter. He painted a number of frescoes and works in oil in the cathedral there and then went to Venice, where he died, the victim of his intemperance. Feti inclined to the naturalism of Caravaggio, and in Mantua imitated Giulio Romano. He had considerable ability; but his pictures, though in many cases powerful in coloring, possess little style, being often ill-managed as to light and shade, and the vulgarity of his nature prevented his religious works from being of a high class. His paintings are well distributed through the galleries of Europe; Dresden has 11 of them, including "David with the Head of Goliath"; Vienna 10, among them, "The Flight into Egypt"; and the Louvre 4, including "Melancholy," one of his best efforts.

FETIALES, fě'shī-ā'lēz (Lat., speakers, from *fari*, Gk. *phāvai*, *phanai*, to speak). Roman priests who acted in international affairs as heralds in the announcement of war to a foreign state, and who presided over the solemnities attending the return of peace. Their duties were discharged with much ceremony. They were anciently citizens of high birth, were chosen for life, and were called *patres patrati*. Consult Livy, i, 24; i, 32; and also Frank, "The Import of the Fetal Institution," in *Classical Philology*, vii, 335-342 (Chicago, 1912); Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

FETID WOOD WITCH. See FUNGI, EDIBLE AND POISONOUS.

FÉTIS, fě'tās, FRANÇOIS JOSEPH (1784-1871). A Belgian composer and writer on music. He was the son of an organist and played the organ in his native town (Mons) when only 10 years of age. He received his musical education in Paris and then traveled in Germany and Italy, studying the works of the great masters. In 1806 he returned to Paris, married a wealthy woman, and was enabled to devote his time to studying the history of music. In 1813 financial misfortunes compelled him to accept the position of organist and instructor in Douai. In 1821 he became professor in the Conservatory of Paris and published three years later his *Traité du contrepoint et de la fugue*. In 1827 he founded the *Revue Musicale*, a journal devoted to musical criticism. In 1833 he was appointed director of the Royal Conservatory of Brussels, which post he held until his death. He wrote much sacred and instrumental music and seven operas. His principal works are: *Biographie universelle des musiciens et bibliographie générale de la musique* (8 vols., 2d ed., 1860-65); *Histoire générale de la musique* (5 vols., 1869-75), reaching down to the fifteenth century only; *Traité complet de la théorie et de la pratique de l'harmonie* (11th ed., 1875). (Consult Alvin, *Notice sur F. J. Fétis* (Brussels, 1874).)

FETTERLOCK (from *fetish*, Fr. *fétiche*, from Portug. *feticço*, artificial, from Lat. *facticius*, made by art, from *facere*, to make; the term was originally applied by Portuguese pioneers in western Africa to artifacts adored by the natives and supposed by them to possess magical potency). A form of belief and fiducial practice in which supernatural attributes are imputed to material objects, especially objects of artificial character; the practice includes sorcery, thaumaturgy, or magic, with various at-

tendant ceremonies and minor observances. The fetish is usually a figure modeled or carved from clay, stone, wood, or other material in imitation of some deified animal or other object; frequently it consists of fur, feathers, hair, bone, or tooth of a tutelary animal; sometimes it is the animal itself, or some tree, rock, river, or place associated with the tutelary in the mind of the devotee; and in certain cases the belief is so definitely crystallized about the object itself that the customary connection with the tutelary eludes detection—when the belief may be said to grade into idolatry. First noted by Portuguese travelers in Africa, it is now recognized that fetishism is by no means confined to western Africa, but prevails among the primitive peoples of all lands; also that the belief does not represent a fairly definite stage in the development of fiducial notions and practices preceding, say, a totemic stage. Tylor limited fetishism to the doctrine of potencies (or spirits) attached to, or conveying influence through, material objects, in contradistinction from animism, which he defined as the doctrine of spirits in general, and also indicated the way in which fetishism grades into idolatry. However, according to recent data, West African fetishes need not be connected with spirits, except in so far as they are employed to counteract the activities of malevolent beings. Any natural object or artifact becomes a fetish when invested with supernatural power by appropriate incantations, rites, and a coating of magical substances. Fetishes therefore may assume various forms, and the occasional restriction of the term to effigies of human beings or animals is unwarranted by the facts. Significant vestiges of the early belief persisted among the ancient Greeks, who revered trees and sacred places; the Romans, who cast clods of native earth on the site of the sacred city; the Druids of England, who adored oak and mistletoe; the early Germans and Celts with faith in fairies, and many other peoples. See MAN, SCIENCE OF; SORCEROLGY.

FETLOCK, or **FETTERLOCK**. In heraldry, a form of padlock. Edward IV of England adopted this as a charge after the battle of Mortimer's Cross in 1471.

FEU, fū (from OF. *feu*, *fiu*, *fied*, *fief*, *fee*, from ML. *feudum*, property held in fee). In the law of Scotland, a right to the use and employment of lands, houses, or other heritable objects, in perpetuity, in consideration of an annual payment in grain or money, called *feu duty*, and certain other contingent burdens called casualties of superiority. Though "feu" was, like "feud" and "fee" in English law, formerly used to express any kind of tenure by which the relation of lord and vassal was constituted, in its narrower meaning which we have here indicated, and which is that in which it is now almost exclusively used, it was opposed, on the one hand, to those tenures in

which the return consisted of military or other personal service and, on the other, to those in which the return was illusory, the only object of which was to preserve the relation of superior and vassal. A feu, in short, was a perpetual lease—a feu farm, as it was often called—by which the tenant became bound to pay a substantial consideration, and his rights under which he might forfeit, as the penalty of non-payment. In the present day the disposal of land in feu is practically a sale for a stipulated annual payment, equivalent to chief rent. It is in this light, accordingly, that feus are generally regarded in Scotland; and though feus resemble English freeholds in substance, their forms agree mostly with copyhold tenure. See Paterson, *Compendium of English and Scotch Law* (2d ed., Edinburgh, 1865).

FEUCHTERSLEBEN, foik'tērs-lā'ben, ERNST, BARON VON (1806-49). An Austrian physician, philosopher, and poet, born in Vienna. He studied in the university of that city, became lecturer in medicine there in 1844, and was made Undersecretary in the Ministry of Public Instruction in 1848, but resigned in the same year. His *Lehrbuch der ärztlichen Seelenkunde* (1845) was translated into English, and others of his attractively written medicophilosophical works enjoyed a high reputation. He is, however, best known by his *Zur Diätetik der Seele* (1838), which is still widely read. His nonmedical works, with a biography (7 vols.), ed. by Friedrich Hebbel, were published in 1851-53. Some of his lyric and didactic verses appear in most anthologies. His best-known poem, *Es ist bestimmt in Gottes Rat*, set to music by Mendelssohn-Bartholdy, has become a *Volkslied*.

FEUD (AS. *fēhp*, enmity, from *fah*, hostile, OHG. *fēheda*, Ger. *Fehde*, hatred, OIr. *fiogh*, enemy, Lith. *piptas*, bad, OPruss. *popaiki*, he deceives). A war waged by one family or small tribe on another, to avenge the death or injury of one of its members. It prevailed extensively among the nations of northern Europe, and it was only by gradual steps that the practice was first restricted and then abolished. The laws of the Emperor Rudolph I recognized the right of private war. At last partial associations were formed, the members of which bound themselves mutually to settle their differences by courts of arbitration and compensation without going to war. The practice, however, continued in many parts of the world and has survived to the present day in the feuds of the Kentucky and Tennessee mountains in America and in the Corsican *vendetta*. See **FEUDALISM**.

FEUD (IN LAW). See **FEU**.

FEUDAL ARCHITECTURE. A term applied to architecture during the feudal age, i.e., from about the tenth century to the fifteenth. (See **GOTHIC ARCHITECTURE**; **ROMANESQUE ART**.) It is generally used in reference to the military architecture of that period, which will be found treated in the article **CASTLE**.

FEUDALISM (Fr. *féodalisme*, Sp., Portug., It. *feudalismo*, from ML. *feudum*, Eng. *feud*, from OHG. *fihu*, AS. *feoh*, cattle, Lat. *pecu*, Skt. *paśu*, cattle). The name used for a group of customs, embracing the political and economic sides of life, which gave to society its characteristic shape during the greater part of the Middle Ages. The rise of the institutions which we call feudal became noticeable shortly after the Ger-

manic invasions, and they attained their highest development from the ninth to the thirteenth century. With the beginning of the fourteenth century certain nonfeudal institutions appeared, and gradually a more modern type of society began to take form. These changes, slow at first, became more rapid and fundamental until eventually the feudal system, as such, was quite overthrown, though certain customs lingered far down into modern times and in some few respects still exercise considerable influence in various countries. Feudalism, therefore, must be studied in its origin, its period of highest development, and its decline; and in the examination of the chief features of the system attention must be paid to the way in which it affected (1) personal relationship, (2) landholding, and (3) the distribution of political power.

The Origins of Feudalism. 1. *Personal Relationship*.—Amid the disorders and insecurity of the early mediæval period it became very usual for men of low rank and little strength to "commend" themselves to men of higher position and greater power. This "commendation" might be to the King, in which case an additional and closer bond was created than that between ruler and subject; or it might be to a noble or a church corporation, or even merely from one freeman to another. Commendation tended to become a formal procedure accompanied by an oath of fealty and service from the inferior to the superior. The relationship thus established was known as that between vassal and suzerain, or man and lord, and the ceremony as "homage and fealty."

2. *Landholding Relationships*.—Landed estates were frequently granted by kings, or other possessors of extensive landed property, to persons who should hold these estates for their own use, but should, in acknowledgment of having received them, perform certain services, or make certain payments, to the grantor. In early times such grants do not seem to have been considered as hereditary, but they tended to become so. Rulers obtained lands to be thus disposed of by conquest and confiscation; men of lower rank received such extensive royal grants that they were in a position to make similar grants on a smaller scale to others. During the same period many holders of land in full ownership gave it to powerful persons or bodies, especially to the Church, taking it back for possession during their own lifetime or during the lives of a certain number of heirs. Such a grant was called a "precarium" and was often held in practically hereditary tenure by the original donor and his successors, although the ultimate title to it was vested in a third person or corporation. In these ways there came to be but little land that was actually owned by the person who occupied it, and but little that was directly claimed by the person who received payments from it. Land had come to be "held" by one man from another, and land "tenure" had taken the place of land "ownership." A piece of land held in this way was called at first a "benefice," later a "fief," a "fee," or a "feud"; the procedure by which it was granted was known as "enfeoffment," and the relation between the person holding it and the person from whom it was held as that between landlord and tenant. See **FEU**; **FEOFFMENT**.

Next, it is to be noted that the personal bond of homage and fealty and the relation of landlord and tenant tended to run together. Men

usually commended themselves to the lord from whom they held their land; a person receiving a fief from the King was both his tenant and his vassal; and when a landholder enfeoffed a tenant he usually received an oath of homage and fealty from him. The conception of vassalage and tenancy became inseparably bound up together. Sometimes, it is true, a fief consisted of something else than land. It might be an office or even a regular income, held on condition of fealty, homage, and feudal service; but after the tenth century, in most western countries of Europe, the possession of any considerable holding of land without the accompaniment of personal homage and fealty to some lord was almost unknown.

3. *Powers of Government.*—Large monarchies, under the conditions existing in the early Middle Ages, could only be governed by placing their different sections or provinces under governors or viceroys. In the Empire of the Franks these were known as counts; in England, as ealdormen; later, earls. When the King was a strong man, and his government well organized and orderly, the governors were appointed officials with limited powers and a temporary, or at most a life, tenure of office. During the disorders of the ninth and tenth centuries, however, the provincial rulers obtained extensive local powers. They exercised such functions of government as taxation, the raising of military forces, the administration of justice, and the coinage of money. Moreover, their positions came to be looked upon and treated as hereditary. In many cases their power was strengthened by the fact that the district over which the count ruled had been occupied earlier by an independent race or tribe and had been brought into the monarchy only by conquest or annexation. The surviving race feeling, therefore, now attached itself to the local ruler. In addition the semi-independent political powers of these rulers over whole districts were closely combined with the personal and landholding relationships already described. Men naturally commended themselves to the nearest powerful lord and performed the services due for their land to him. Ecclesiastical bodies, bishops, and abbays, which were the holders of such a large proportion of the land, and whose estates were considered as being held feudally, were naturally dependent upon the good will of the local ruler to defend them from the attacks of others and to refrain from aggression upon them himself. These rulers also had lands in their possession which they granted out as fiefs to be held from themselves by persons who were thus alike their subjects, their tenants, and their vassals. Thus, in the case of these great lords of whole districts, political powers, the rights of a feudal landlord, and personal lordship were inseparably combined. It is this close union of the powers included under the modern conception of government with a system of landholding and with personal relations of fealty that forms the fundamental character of feudalism and lies at the base of the legal institutions of the Middle Ages. In the great lordships, at first, a fief involved not only the possession of land and of personal claims and duties, but of most of the important rights of government over the persons dwelling on the land.

In the course of time the same conditions came to prevail in a partial degree in smaller lordships too. When the King gave away land, he

frequently granted to the new holder all kinds of claims which he possessed over the people dwelling on the land. In the ninth and tenth centuries, e.g., the King in many cases, especially in land granted to the Church, promised that royal officials should not intrude, in the future, upon the land for purposes of taxation, administration of justice, or military levy. This left it open to the landholder to exercise those rights upon his tenants, who thus became practically his subjects as well. Such royal grants were known as "grants of immunity," or "immunities." In England similar grants were made in late Anglo-Saxon times, reciting the privileges of "sac and soc," "toll and team," and other franchises now imperfectly understood. Sometimes only partial rights of government were given in the immunities, as where the King granted all pecuniary profits from court jurisdictions over a certain district, but did not give any other powers. Ultimately, as feudal conditions became so nearly universal, it was considered that landholding in itself involved the possession of certain political rights over the tenants of the land, the extent of these rights being dependent on the customs or circumstances of each particular case; and in this manner, in the lower as well as in the higher grades of holding of landed estates, there was the same union of proprietorship of the land, lordships over vassals, and rights of sovereignty over inhabitants. In the creation of this complex mass of personal and territorial relations, there was much that was a matter of voluntary choice, but still more that was the result of the exercise of compulsion. The early Middle Ages were a period of violence and disorder, and feudalism was rather a resultant from the conflict of different forces than any planned or logical scheme. Nevertheless a certain equilibrium was reached, if it was only the recognition of the common interests of oppressor and oppressed, of the powerful and the weak; in spite of a thousand variations, from country to country, from estate to estate, from person to person, there was a certain amount of uniformity. It is this degree of consistency which has suggested and partially justified the use of the term "feudal system," and, taking it in this sense, it is possible to give an approximate description of this general body of feudal customs.

The Feudal System. About the thirteenth century a number of treatises or codifications of feudal law and customs were drawn up, such as that of Beaumanoir and other similar *Customiers* in France, the *Sachsenspiegel* and *Heinrichspegel* in Germany, and the *Libri Feudorum* in Italy. The appearance of these feudal codes, as well as other facts arising from a direct study of institutions, seems to point to the thirteenth century as the culminating period of feudalism, though the course of its development was very different in different countries. From the point of view of landholding, feudalism was most complete in England, owing doubtless to the occurrence, just in the constructive period of feudal institutions, of the Norman Conquest with its accompanying confiscations and regrants. Independent political powers were developed most completely in Germany or Italy, but, on the whole, feudalism may be said to have had its most symmetrical development in France, and it is there studied most satisfactorily as a complete system.

The base of the whole structure was the fief.

A fief was a body of land; it might be made up of a large stretch of contiguous territory or of many separate tracts, or it might be a single estate, or even possibly a comparatively small number of acres in a certain manor or township, which a tenant held from his lord on condition of certain "feudal" services. When the fief was first granted, or when it was obtained by inheritance, or when a new lord succeeded to the suzerainty, a ceremonial "investiture" took place according to the traditional forms of the ceremony of fealty and homage. The tenant kneeled before the lord, placed his clasped hands between the hands of his lord, and in this attitude swore to be his man and to preserve fidelity to him in all things. The lord accepted the fealty and homage by kissing the tenant and inferentially promising him his protection and patronage, and by conveying to him, frequently by some symbolic action, the fief of which the vassal now became possessor.

The services owed by the tenant were of the following general classes: Military service was the duty of serving his lord in war with a certain number of men for a certain time; according to a widespread custom, once a year and for 40 days. So general was this duty that feudal tenure is frequently called military tenure. Court service was the twofold duty of coming when summoned to be a member of a body to decide in cases concerning one of his "peers" or fellow vassals of the same lord, and of submitting himself to the jurisdiction of such a court or of his lord. "Wardship" is the term applied to the right of the lord to assume the guardianship of the minor heir of a deceased tenant and the income from the estate during the minority, with the requirement, however, that the proper support and education of the heir be provided for from the estate. "Marriage" similarly was the right of the lord to control the choice of a husband for the heiress or the widow of a tenant and frequently of a wife for the heir. These last two forms of service reduced themselves practically to the imposition of a money fee proportionate to the value of the estate concerned. Military service also was frequently transformed into a money payment. There were other direct money payments, although usually at quite uncertain intervals. Of these, "relief" was a money fee due from an heir on the acquisition of his property. It was very commonly estimated at a sum equal to the value of one year's income of the estate. "Aids" were payments of an amount settled by custom under certain contingencies; the three most generally recognized were: (1) to defray the expenses of knighting the lord's eldest son; (2) of the marriage of his daughter; (3) of his ransom in case he were captured in war. These were not usually exacted by any feudal lord except the King, and by him only from his direct tenants or tenants in chief; but these in such a case might call upon their tenants to reimburse them for what they had paid to the King. Finally, "escheat" and "forfeiture" were the conditions in which the fief could be taken back by the lord—the former in the case where there was no heir, the latter in the case where the tenant had failed in the performance of his feudal obligations. "Subinfeudation" is a term used to describe the grant of a portion of a tenant's holding to another person, to hold from him on terms similar to those on which the first tenant holds from his lord. Generally speaking, all the land of a country

was held from the King by a comparatively small number of direct tenants, known as tenants *in capite*, or *in chief*. Many of these had very large fiefs, consisting of a vast number of estates. They granted some portions of their holdings, as lesser fiefs, to others, and these a still further portion to others below them, and so on till there were frequently six, eight, or more *mesne* or "mean" lords between the actual tenant of a certain estate and the King from whom it was ultimately held. All tenants below those *in capite* were known as "subtenants."

Feudal Society. The people were divided, according to contemporary writers, into three classes: those who did the fighting, the nobles; those who did the praying, the clergy; and those who did the work. The nobles were necessarily warriors. In order to be able to devote themselves to fighting, they were obliged to have an income sufficient for their support, and for equipping themselves and their followers when they went to battle. They were the holders of the estate, which will be described below when the workers are treated of. The rank of a noble depended upon the extent of his possessions. The rulers of provinces who could lead immense bands to war were designated as dukes, marquises, or counts. Below these were barons and knights, who held varying amounts of property which enabled some to lead large troops of followers to battle; others were under the necessity of serving in the following of some more wealthy noble, usually the one from whom they held their fief. Lowest of all were the squires, or attendants upon the knights, who at first had no land, but later acquired large estates. They formed the great mass of the nobility in the thirteenth century. The home of the noble was his castle. There he lived as a petty monarch, exercising authority over his vassals and tenants. When he was not engaged in war, he devoted himself to the management of his fief or to hunting. The management involved more than merely looking after the property; for the lord had the executive, judicial, and administrative powers all in his own hands. He had to hold courts, administer justice, and police his fief. Hunting was not merely a pastime, but one of the chief means of supplying food for the table.

The noble's wife (*châtelaine*) had charge of the household and superintended the work of the maids, who did the spinning and weaving. She had to know something of medicine and nursing, as the care of the wounded and sick devolved upon her. In her husband's absence she was obliged frequently to take his place in defending the castle or administering the fief. In her leisure moments she might embroider tapestries or play chess; such are the occupations generally depicted in the *chansons*; but in reality the lady usually was busy with her household duties or in making clothes. The bunch of keys which she wore at her girdle was the fitting emblem of her duties. The education of the daughter of a noble was devoted wholly to giving her a knowledge of the duties which she would be expected to perform. (The education of the son has been discussed under *CHIVALRY*.) With the acquisition of wealth, after the twelfth century, games, minstrelsy, and tournaments became common. Prodigality was the prevailing characteristic of the age and soon impoverished most of the nobles. Even in this age, which is glorified by the poets, luxury and lack of com-

fort went hand in hand. At the gorgeous festivals in the castles many things which we now consider necessities were wholly lacking.

The members of the clergy were originally either nobles or peasants. Their duty was to pray, and to care for the moral welfare of the society. As a rule, they were somewhat better educated than the other members of the community. The bishops and the abbots were great landholders and had the same responsibilities as the lay nobles, from whose life their own often differed but little. At the other extreme of the clerical body were the village priests, who had sprung from the people and shared the lot of the latter.

Those who did the work were the peasants. They were obliged to support not merely themselves, but also the nobles, by whom they were generally despised as inferiors. They lived usually in villages, about which stretched the lands which they cultivated. Some of the peasants were freemen; others, serfs. In fact, there were many gradations in social rank according to the amount of freedom which each class possessed. Here we can notice only the two general classes. The freemen held land from the lord of the fief which could not legally be taken from them. For this they paid a fixed rent which could not be increased by the lord. The serfs also had holdings of lands which could not be taken from them; but as payment for their lands they owed personal services and a part of their crops to the lord of the fief. He, or his representative, lived in a castle or fortified house a little apart from the village. Near the castle was a tract of land which the lord kept in his own possession, to be worked by the peasants for his profit. The remainder of the land was divided into long, narrow strips held by the peasants, no peasant, however, being allowed to hold a number of adjacent strips. The cultivation of the land was carried on in common by the holders of neighboring strips. The villagers were bound closely together by their common work and mutual responsibility, for each village was collectively responsible for the order within its limits. See **MANOR**.

Some of the villages grew into towns by the erection of fortresses or because of their favorable location for trade. The towns were, like the villages, the property of some lord or lords. But the townspeople were usually engaged in manufacturing or trade and thus obtained wealth. Consequently they were able to form effective associations (see **GUILDS**), which bought or usurped the rights which the lords possessed to collect payments from them. Many obtained charters of liberties and became almost self-governing communities. Individual merchants acquired wealth and vied with the nobles in luxury and ostentation. The members of the "third estate," as the townspeople came to be called, secured representation in the national assemblies and gradually emerged from their despised condition to become the real backbone of the nations.

Military Organizations. The element of personal relationship, which is the main characteristic of the feudal system, affected to a marked degree the organization even of the mediæval army. The fighting force under feudal conditions was marked by four main characteristics: (1) its members were a military class; (2) they fought as cavalry; (3) they were grouped in small irregular units; and (4) they

fought almost without strategy or tactics. The first of these characteristics arose from the fact that all military service was provided as a return made by a vassal for the grant of land. When land was granted by kings and great nobles to vassals on condition of military service, the capacity to furnish this service when demanded was requisite, and therefore men with military training and equipment were a necessity. Military service was also doubtless a source of pleasure and a matter of pride, since the fighting class was also the landholding and the ruling class. (2) The fact that a feudal army was a mounted body arose from the nature of the times in which feudalism arose. In the ninth and tenth centuries Northmen, Magyars, and Saracens were in the various parts of Europe making rapid forays into the old settled regions, and to meet them successfully it was necessary to have a force that could move as rapidly as they. Therefore the counts and kings who were engaged in defending their territory against these invaders substituted mounted troops for the foot soldiers employed formerly in the civil wars or in the invasions of the Roman Empire. There were some foot troops usually included in a feudal army, but their employment in fighting was quite subordinate. An important exception to this, however, was the case of England, where the archers from a very early time constituted a valuable part of the field forces and repeatedly showed themselves superior to the chivalry of France. (3) The third characteristic, the lack of a hierarchy of leaders, and of a series of divisions and subdivisions of the parts of an army, arose from the way in which it was recruited. Each count, baron, or gentleman brought with him a smaller or larger group of knights and continued to act as the leader of his group during the fighting. The only regularity was in cases where the lesser knights and esquires were brought to an engagement in squads under the leadership of royal officials. But in most countries these were only a small part of the whole body of fighting men. Any such arrangement as the modern divisions of brigades, regiments, and companies was entirely unknown and inapplicable to the prevalent style of fighting. (4) With this organization, or lack of organization, there could be no system of tactics. There was usually some crude grouping of the whole body of troops into two or three "battles," under different leaders; but as a matter of fact the fighting men usually began the onset as soon as they came in sight of the enemy, and the engagement rapidly became a mere mêlée, or series of separate encounters. Fine personal valor and great personal skill and strength were often displayed in such contests; but the army as a whole was very ineffective. Similarly strategy or planning for a large campaign usually consisted simply in passing into the enemy's country and, while rather languidly seeking an engagement, burning and plundering the property of the enemy's subjects. The great feudal weapons were the lance and the battle-axe, with some use of the sword. (See **BATTLE-AXE**.) There was a development of body protection from the mere coat of mail and headpiece to full plate armor. See **ARMOR**; **BREASTPLATE**; **CHAIN MAIL**; **HELMET**; **SHIELD**.

Such feudal armies were characteristic of the eleventh, twelfth, and thirteenth centuries. The Crusades made less change in warfare than

might have been anticipated, the Western armies remaining much the same in organization. By the fourteenth century, however, some new elements were grafted on this system. Hired bands of mercenaries were largely employed (see BRABANÇONS; CONDOTTIERI), and these were somewhat better organized and handled. Certain new troops were used, or old forms brought into a new prominence. The Swiss pikemen and halberdiers, fighting in a solid phalanx, frequently overwhelmed a more purely feudal army of armored cavalry, especially when the fighting was in a mountainous country. The English bowmen, armed with the rapidly discharged and effective longbow, were used in connection with heavy-armed cavalry and men at arms. Their rapid and deadly flight of arrows threw into confusion any stationary body of feudal troops opposed to them and put this body at the mercy of the knights whom the archers were supporting. If the opposing cavalry force was charging, the arrows retarded their advance so much as to make its onset ineffective. The effort to meet these new conditions or to utilize them to the best advantage, along with the other influences of the time, gradually led to a diversification of tactics and eventually to the organization of the modern type of armies. The invention of gunpowder and its gradual introduction in warfare was rather an element in the development of modern military systems than a source of any sudden change.

The Decay of Feudalism. Feudalism was in its very nature anarchic. The possession of military power was an incitement to its use in the settlement of private feuds; the imperfect subjection of vassals only slightly less powerful than their lords led to frequent resistance on their part; the absence of a strong central government, resulting from the possession of sovereign rights by the nobles, diminished the salutary power of enforcing order from above. The feudal castle, fortified and guarded, held in the name of the ruler, but frequently used as a base of operations to despoil and tyrannize over the surrounding country, and to wage petty warfare with other feudal nobles, was as characteristic an element of feudalism as were the legal and economic features which have been described above. During the latter part of the Middle Ages, from the thirteenth century onward, other institutions were being developed which did not fit into the feudal system. Town life, trade, and commerce, a well-to-do free middle class, and strong centralized monarchies grew up in the various western countries, so that feudalism became restricted to a less and less extensive proportion of human interests. Even in those fields in which feudalism had been dominant, in landholding, personal relations, and the powers of government, fundamental changes were taking place. Land came to be generally held on condition of mere pecuniary payments and became a subject of purchase, sale, and bequest. Contractual relations, and those of subject and sovereign, took the place of the personal bond of earlier times. Military powers, the right of taxation, the right of coinage, even the right of court jurisdiction, were withdrawn by the national governments from the feudal barons. During the thirteenth century in England, the fourteenth in France, and the fifteenth in Germany, the kings were able to put an end to private warfare and to reduce feudal jurisdiction to a definite inferi-

ority to that of the King. Notwithstanding the decay of feudalism in these respects, however, class distinctions based upon it, certain privileges of taxation, and peculiarities of landholding continued to exist until in France they were swept away by the Revolution, in 1789, while in Germany and England traces of their influence may still be found.

Bibliography. The older works are of little use now. The following general works are especially valuable in themselves, and also contain many references to monographs treating different phases of feudalism: Luchaire, *Manuel des institutions françaises* (Paris, 1892); Esmein, *Cours élémentaire d'histoire du droit français* (ib., 1901); Seignobos, *Feudal Régime*, trans. by Dow (New York, 1908); Secrétan, *Essai sur la féodalité* (2 vols., Lausanne, 1858); Flach, *Origines de l'ancienne France* (3 vols., Paris, 1866-1904); Viollet, *Histoire des institutions politiques* (2 vols., ib., 1890-98); Abdy, *Feudalism: Its Rise, Progress, and Consequences* (London, 1890); Stubbs, *Constitutional History of England*, vol. i, 6th ed., ib., 1897; Pollock and Maitland, *History of English Law* (2 vols., Cambridge, 1895); Gautier, *La chevalerie* (Paris, 1895; Eng. trans., London, 1891); Schultz, *Das höfische Leben zur Zeit der Minnesinger* (2 vols., Leipzig, 1879-90); Prutz, *Age of Feudalism and Theocracy* (Philadelphia, 1905; vol. ix of *History of all Nations*); Munro, *Seigniorial System in Canada* (New York, 1907); *Feudal Aids*, vol. v (London, 1909); Round, *Feudal England* (ib., 1909); Petersen, *Über den Kurländischen Adel im 17. Jahrhundert* (Berlin, 1911).

FEUDAL SYSTEM. See FEUDALISM.

FEUDAL TENURE. The system by which land was generally held in western Europe during the Middle Ages. It allowed one man to hold the title, while the use belonged to some one else. The former was known as the lord or suzerain, while the latter was the vassal and owed service for the land. If the vassal was a noble, his service was generally of a military nature, while if he was a villein, his service was usually in the form of work on his lord's estate. The noble's land was known as a *fief* (see FEE), and there was nothing to prevent him from holding of several lords, but the one to whom he owed service primarily was known as *liege lord*. In some parts of Europe the feudal system had made little or no headway. Here property was held in fee simple, which was known as allodial tenure, and the separate estate was the allodium. See FEUDALISM.

FEU DE JOIE, *fé de zhwi* (Fr., fire of joy). A form of musketry fire reserved for the celebration of some joyful event, as, e.g., the observance of the King of England's birthday in the British army. The troops are formed in line, in two ranks, at open order. On the command *present*, rifles are brought to that position, with the muzzles pointing upward, care being taken to secure a uniform angle of elevation. On the command *fire*, the right-hand man of the front rank discharges his rifle, followed at scarcely perceptible intervals by the men on his left successively. When the extreme left of the front rank is reached, the left-hand man of the rear rank immediately follows, the fire being similarly continued until the extreme right is attained, when the round is completed. Three rounds, as a rule, are fired on such occasions. The random or independent discharge

of firearms in the air, common to Indians and other uncivilized bodies of warriors, might be termed a *feu de joie*.

FEUERBACH, *foi'ér-büç*, ANSELM VON (1829-80). A German historical painter. He was born at Speyer, Sept. 12, 1829, the son of the archaeologist Anselm Feuerbach (1798-1851). His artistic proclivities having been early awakened in the course of his education at Freiburg (1836-46), he went to Düsseldorf in 1846, where he studied under Schadow and Rethel, and later to Munich, to work under Rahl. In order to perfect himself in color, he proceeded to Antwerp in 1850 and thence to Paris. Under the guidance of Couture he acquired that minute finish of form and broad coloristic treatment which are characteristic of his works. The first of these was "Haliz at the Inn" (1852). Leaving Paris in 1853, he painted at Karlsruhe the "Death of Pietro Aretino" (1854) and in 1855 went to Italy, with a stipend from the government; working first in Venice, where he made a masterly copy of Titian's "Assumption," and painted a "Colossal Figure of Poetry" (1856), now in the Karlsruhe Gallery. From 1856 to 1872 he was in Rome, where, absorbed in the enthusiastic study of the great Italian masters, he developed his individual style. The first fruit of this tendency was his "Dante with the Noble Ladies of Ravenna" (1858), which is distinguished by golden glow and depth of color. In Rome Feuerbach found a munificent patron in Baron von Schack, who acquired a number of his canvases for his famous collection in Munich, foremost among them the impressive "Pietà" (1863), besides "Francesca da Rimini and Paolo" (1864), "Ariosto with the Ladies at Ferrara," "Haliz at the Fountain" (1866), "Laura and Petrarch at Avignon," "Idyl from Tivoli." From his sojourn in Rome also dates the charming "Madonna Surrounded by Angels Making Music" (1860, Dresden Gallery). More and more he confined his choice of subjects to the antique world, striving to give expression to his ideal—the cult of beauty—in serious and lofty themes. He understood, better than any other modern artist, the noble and simple dignity of antique art; but he lacked the joyousness of the antique spirit. A tinge of asceticism pervaded his works, mingling an intensely personal note with their grave majesty. In Rome his glowing color became cooler and his efforts were concentrated upon psychic expression. Thus originated "The Banquet of Plato" (1867, in Karlsruhe Gallery), in a second conception of which, on a larger scale (1873, National Gallery, Berlin), he reaches the greatest heights of classical inspiration; "Medea Preparing for Flight" (1870, New Pinakothek at Munich); "The Judgment of Paris" (1870, Hamburg Gallery), one of his most forceful compositions; "Iphigenia in Tauris" (1871); and the "Battle of the Amazons" (1873, Nuremberg Gallery). In 1873 Feuerbach was appointed professor at the Vienna Academy, but, embittered by lack of appreciation, he resigned in 1877 and retired to Venice, where he died Jan. 4, 1880. His last works were the exquisite though unfinished "Concert of Venetian Girls" (1878, National Gallery, Berlin), and the "Fall of the Titans" (1879, Vienna Gallery). Feuerbach's subtle personality is revealed to us in his autobiographical work, *Ein Vermächtnis von Anselm Feuerbach* (Vienna, 5th ed., 1902). Consult

Pecht, in *Zeitschrift für bildende Kunst*, viii (Leipzig, 1873) and the monographs on Feuerbach by Allgeyer (Stuttgart, 1904), Heyck (Bielefeld, 1905), and Ulnde-Bernays (Stuttgart, 1913).

FEUERBACH, LUDWIG ANDREAS (1804-72). A German philosopher, fourth son of Paul Johann Anselm Feuerbach. He was born at Landshut. After studying theology for two years at Heidelberg under Paulus and Daub, in 1824 he was attracted to Berlin for the purpose of hearing Hegel, and soon afterward he abandoned theology to devote himself entirely to philosophy. In 1828 he became privatdozent in the University of Erlangen, but in a few years quitted the academical life on account of the offense he had given by the publication of an anonymous book attacking the belief in immortality (*Gedanken über Tod und Unsterblichkeit*, 1830). He now gave up his whole time to literary labor, residing at Ansbach and then at Bruckberg near Bayreuth till 1860, when he settled near Nuremberg. During the next few years he published three works on portions of the history of philosophy, treating the period from Bacon to Spinoza, and the theories of Leibnitz and of Bayle. But these historical works only paved the way to a critical investigation into the nature of religion and its relation to philosophy. The most celebrated result of this is his work on the nature of Christianity (*Das Wesen des Christentums*, 1841), which was translated into English by George Eliot under the title *The Essence of Christianity*. This was followed in 1845 by *Das Wesen der Religion*. Starting from the Hegelian doctrine that the absolute comes to consciousness in humanity, Feuerbach denies to God any existence except as an idealized object of human consciousness. The conception of God is thus merely the projection by man of his own ideal into the objective world. All authority above man is regarded as a delusion proceeding from man himself, and the highest good is explained as that which is, on the whole, most pleasurable. Yet even this highest good is further explained as consisting in resemblance to that ideal humanity which man creates for himself and worships as God. In a later work he says that man is only what he eats (*Der Mensch ist was er isst*). In the last years of his life he devoted himself to ethical studies, which he pursued in a hedonistic spirit. (See HEDONISM.) Although the impulse towards pleasure is for him the basis of all morality, the pleasure of others must be considered as of equal importance with one's own pleasure. (See UTILITARIANISM.) Feuerbach was a man of high ideals in spite of his philosophical materialism. He made numerous friends both at home and abroad, and his writings were very popular. The works of Feuerbach were collected and published in 10 vols. (Leipzig, 1846-66). A later edition has been published, *Sämmtliche Werke* (10 vols., Stuttgart, 1905-06). For his life, consult: Grün (Leipzig, 1874); Beyer (ib., 1873); Starcke (Stuttgart, 1885); Jodl, *Ludwig Feuerbach* (ib., 1904). For his philosophical system, consult Engels, *Ludwig Feuerbach und der Ausgang der klassisch-deutschen Philosophie* (ib., 1888), and Bolin, *Ludwig Feuerbach und seine Zeitgenossen* (ib., 1891).

FEUERBACH, PAUL JOHANN ANSELM VON (1775-1833). A distinguished German jurist, born near Jena, Nov. 14, 1775. Brought up at

Frankfort-on-the-Main, where his father was an advocate, and educated in the gymnasium there, he went in 1792 to Jena, where he studied law and philosophy. In 1798 he appeared as a criminal jurist in a work entitled *Philosophisch-juristische Untersuchung über das Verbrechen des Hochverrats*, and in the following year he began to deliver lectures in the University of Jena. In his lectures and published writings he introduced into criminal jurisprudence a new method of treatment, which was systematized in his compendium of German penal law (*Lehrbuch des gemeinen in Deutschland geltenden peinlichen Privatrechts*, Giessen, 1801; 14th ed. by Mittermaier, 1874). This celebrated work placed Feuerbach at the head of the school of jurists who maintain that the decision of the judge in every case ought to be determined solely by a literal application of the penal law, never by his own discretion, and who on that account obtained the name of "rigorists." In 1801 Feuerbach was appointed full professor in Jena, but in 1802 accepted a call to Kiel. In 1804 he removed to the University of Landshut; but the next year, having received a commission to prepare a penal code for Bavaria, he was transferred to Munich, and in 1808 he was appointed Privy Councillor. The new penal code which he planned for Bavaria (*Strafgesetzbuch für das Königreich Baiern*, München, 1813) received the royal approval and was taken as a basis for the emendation of the criminal law of several other countries. During this period also he published his "Remarkable Cases in Criminal Law" (*Merkwürdige Kriminalrechtsfälle*, 2 vols., Giessen, 1808-11), which first led the way to a deeper psychological treatment of criminal cases. In 1812 he published a work on trial by jury, to which a second volume, on the judicial procedure of France, was added in 1825. In 1814 he became second president of the Court of Appeals in Bamberg, and in 1817 first president of the Court of Appeals at Ansbach. In 1832 he published a work on Kaspar Hauser, whose mysterious fate had strongly attracted his interest. He had just edited a collection of his miscellaneous writings, when he died at Frankfort-on-the-Main, May 25, 1833. An interesting life of Feuerbach was written by his son Ludwig, *Leben und Wirken Anselm von Feuerbachs* (2 vols., Leipzig, 1852).

FEUERKRÖTE, foi'ér-krō'te (Ger., fire toad). A common and curious frog (*Bombinator igneus*) of Europe, called "fire-bellied" because of the vivid flame color, marbled with black, of its underparts. The abdominal surface is smooth, but the upper surface, which is olive green, is extremely warty and toadlike. Two varieties (or perhaps species) are recognized, the orange-bellied of the lowland marshes and the yellow-bellied of mountainous regions. It extends eastward into temperate Asia, but is not known in Great Britain. It is essentially aquatic. The female utters a high-pitched cry and is exceedingly shy; the tadpoles grow to an unusually large size, especially in respect to their tail fin. These frogs are interesting as representatives of the peculiar family *Discoglossidae* (q.v.) and also for the remarkable way in which, when they think themselves in danger, they assume an erect, stiffened attitude intended to display the bright "warning colors" of their bellies. This is correlated with the fact that their skins yield an exceedingly poisonous secretion, so that no known bird or

mammal eats them. Consult Gadow, *Amphibia and Reptiles* (London, 1901).

FEUERSNOT, foi'ers-nōt' (Ger., The Lack of Fire). An opera by Richard Strauss (q.v.), first produced at Dresden, Nov. 21, 1901.

FEUILLANTS, fe'yain'. The name applied to (1) a religious congregation, springing out of the Cistercian Order and taking its name from the mother house of Feuillant, Lat., Fulium, near Toulouse. Its founder was Jean de la Barrière, who was abbot of this monastery from 1562. Protestantism made inroads upon his community and the ancient discipline was relaxed. Finally, after courageous efforts at enforcement of the rule, he was deserted by nearly all his monks and himself accused as an innovator before the General Chapter at Cîteaux. He defended himself so successfully that a number of the old monks put themselves under his guidance, and he instituted a severer mode of life than had of late been customary in Cistercian houses. They came to Paris in 1587, protected against the Huguenots by a troop of cuirassiers, to take possession of the convent founded for them by Henry III. The reform was confirmed as a separate congregation by Sixtus V in 1589. In 1630 Urban VIII divided them into two branches—the Italian, known as Reformed Bernardines, and the French, who still kept the name of Feuillants, each under a general of its own. At the Revolution they possessed 24 abbeys in France. Cardinal Bona and other famous theologians have belonged to this order. Barrière also founded a community of women, and Cardinal Rustico did the same at Rome, placing his under the direction of the Feuillant fathers. Anne of Austria founded a house for them in Paris in 1662.

2. A faction in the assembly of the clergy in Paris (1755), which discussed the execution of the constitution *Unigenitus*. At this time Cardinal de la Rochefoucauld, Archbishop of Bourges, was appointed Minister of Public Worship (*de la Feuille*, hence the name) and took the lead of a sort of ministerial party, Gallican and half Jansenist in tone, which formed a small majority of the assembly. See GALLICAN CHURCH.

3. A political club in Paris during the early years of the French Revolution, originally known as the Society of the Friends of the Constitution, or the Club of 1789. It met in the ancient convent of the Jacobins and comprised a majority of the members of the Constituent Assembly. With the progress of radical ideas the friends of monarchy in the society grew discontented, and in July, 1791, more than 300 deputies, among them Barère, Lanjuinais, Sieyès, Lafayette, and the Lameths, seceded, taking up their home in the convent of the Feuillants in Rue Honoré. (See above.) Those who remained came to be known specifically as Jacobins (q.v.). The Feuillants lost rapidly in numbers and influence; as a group of well-fed men who believed in a constitutional monarchy, they were hated alike by Jacobins and Royalists. In the Legislative Assembly they numbered only 162 out of a total of 745, and from conservative they became, in the course of time, reactionary. The Jacobins repeatedly impeached them before the Assembly; in December, 1791, they were compelled to abandon their meeting place in the Feuillants, and in August, 1792, the papers of the club were seized

and their members listed as suspects. It died peacefully.

FEUILLET, fē'yā', OCTAVE (1821-90). A popular French novelist and mediocre dramatist, born at Saint-Lô, Normandy, a favorite of the court and society of the Second Empire. He began his literary life as a collaborator of the elder Dumas, but presently deserted the romantic group and set up as a purveyor of novels and plays that should seem proper for general reading. His early dramas, such as *Le roman d'un jeune homme pauvre* (dramatized from his novel of the same name, in 1858), are fundamentally unhealthy growths of hothouse sentiment. His dramatic works (*Théâtre complet*) were collected in 5 vols. (1892-93). No novelist has painted so well the high-strung, neuropathic society woman, and in this he contributed an essential element to the growth of realism in fiction, although as a writer he stood midway between the romantic and the realistic schools. On the fall of the Empire he grew more sternly realistic in his treatment of the hard, selfish cynicism of the French upper class. It is curious to contrast in this regard *Monsieur de Camors* of 1867 with *Julia de Trécarur* of 1872, and this again with the *Histoire d'une parisienne* (1881) and *Les amours de Philippe* (1887). Consult L. Deries, *Octave Feuillet* (Saint-Lô, 1902).

FEUILLETON, fē'yo-tōn' (Fr., leaflet). A name given first to the literary portion of a French journal, usually occupying the lower third of the first page, "below the line" as it is technically called. The idea originated with the elder Bertin, editor of *Le Journal des Débats* (1800-41). The space was originally occupied, as it is often still, by criticisms, essays, and tales; but in the early thirties, first perhaps by Eugène Sue, the feuilleton began to be used for continued serial stories, often of portentous length. As each day demanded its copy, hasty production became the rule, unity of construction was sacrificed to the independent interest of each fragment, the attention of the reader was directed to details, and the whole suffered from the accentuation of its parts. This will account for the literary defects in such still popular novels as Dumas's *Monte Cristo* (Paris, 1845); Sue's *Le juif errant* (ib., 1845); and *Les mystères de Paris* (ib., 1843). The greatest purveyors of feuilleton were the elder Dumas, Sue, Soulié, Souvestre, Karr, Bernard, Paul de Kock, and Junin. Their most popular successors have been Ponson du Terrail, Xavier de Montépin, and Jules Mary.

FÉVAL, fē'vāl', PAUL HENRI CORENTIN (1817-87). A prolific French novelist, best remembered for his sensational *Mystères de Londres* (11 vols., 1844), which rivaled for a time Sue's *Mystères de Paris* and was dramatized and several times translated. Among other novels dramatized with success the more noteworthy are *Le fils du diable* (1847), and *Le bossu*, with Sardou (1858). There are translations of other novels with the titles *The Lover of Paris* (1846), *The Duke's Motto* (1863), *The Woman of Mystery* (1864), and *Thrice Dead* (1869). Consult Ch. Buet, *Mémoires et Œuvres* (Paris, 1885).—His son, PAUL FÉVAL (1860-), followed his footsteps very creditably with *Nouvelles* (1890) and *Chantépe* (1896) as well as with several successful plays.

FEVER (AS. *fefer*, OHG. *fiebar*, Ger. *Fieber*, from Lat. *febris*, fever, from *ferere*, to be hot). A rise in the body temperature attending most

acute and some chronic diseases. The temperature is estimated according to the state of the internal parts rather than the external. The term "fever" is also applied to certain diseases in which high temperature is a prominent symptom, as typhoid fever, scarlet fever, yellow fever. Fever is a constant accompaniment of these diseases, as well as of pneumonia, which was formerly called lung fever. In most such diseases there is first a feeling of weakness, apathy, loss of appetite, and a chill, with pains in the body and limbs, and rapid pulse, constituting the period of *invasion*. Succeeding this comes the period of *domination*, during which the pulse remains rapid, the surface becomes flushed and hot, the temperature rises still higher; thirst, headache, restlessness, and rapid breathing exist; the skin is very dry, and the urine is scanty. During the *decline* of the fever the temperature falls, perspiration breaks out, the rate of respiration diminishes, pains cease, and the patient falls asleep. All fever is dependent upon a morbid process which is due partly to chemical changes which occur in the cells and partly to irritation of the nervous system by toxins produced by the disease. There are no "self-originating" or "spontaneous" or "idiopathic" fevers. Fevers are named according to prominent features, supposed or real causes, or localities in which they are commonly found. Thus, we have scarlet and yellow fevers, malarial fever, ship (or jail) fever, Mulla fever, spotted fever, dengue (or dandy) fever, etc. If a fever is protracted for several days during which the temperature remains above the normal (98.6° F.), the type is called *continued*; if the temperature drops to be normal and rises again, after intermissions of a few hours, a day, or two days, the fever is called *intermittent*; if the temperature falls to a point above the normal and ascends again, oscillating in this way for several days, the fever is styled *remittent*. A certain fever decreases after several days till the temperature reaches the normal, and then after an interval of a few days it returns. This is styled *relapsing* fever. An intermittent (malarial) fever in which the intermission is one day, or two days, or three days, is respectively termed a quotidian, tertian, or quartan type. A rise of temperature due to fatigue, teething, or to vaccination, or a local heat due to an infected sore or a boil, is not called a fever, though probably with a larger knowledge of the pathological conditions of tissue during fever the name might be applied even to these cases.

In treating cases of fever it is customary to record at certain intervals each day the degree of temperature reached by the clinical thermometer, placed in the mouth or rectum of the patient. This record of temperature is plotted on a special chart, with lines connecting the points reached by the temperature, and the resulting diagram is called the "fever curve." For convenience' sake the rate of pulse and of respiration, morning and evening, is recorded on the chart as well as the defecation and urination in certain cases. For ardent fever, see HEAT STROKE; for autumnal fever, see TYPHOID FEVER; for ship fever, jail fever, or camp fever, see TYPHUS FEVER; for spotted fever, see MENINGITIS (paragraph *Cerebrospinal Meningitis*); for bilious fever (an improper term), see MALARIA and TYPHOID FEVER. Many other febrile disorders are described under their own names.

FEVER BLISTERS. See HERPES.

FEVER BUSH (so called as being sometimes used for intermittent fevers), *Lindera æstivalis*, or, as formerly known, *Benzoin odoriferum*. A shrub common in the northern United States, remarkable for its graceful form and beautiful leaves. It is from 4 to 15 feet high and grows best in moist and shady places. The bark is aromatic and tonic, and a decoction is used as a stimulant in fevers. The berries, which are bright scarlet in autumn, have occasionally been used as a substitute for allspice, and sometimes the shrub is called spicebush and wild allspice.

FEVERFEW (AS. *feferfuge*, from Lat. *febrifugia*, century plant, from *febris*, fever + *fugere*, to put to flight, from *fugere*, to flee), *Chrysanthemum parthenium*. A perennial plant belonging to the Compositæ, found in waste places and near hedges in America and many parts of Europe. It is botanically allied to chamomile and still more nearly to wild chamomile (*Matricaria chamomilla*) and much resembles these plants in its properties, but differs in appearance, the segments of its leaves being flat and comparatively broad, and its flowers smaller. Its habit of growth is erect, its stem much branched and about 1 to 2 feet high. It has a strong, somewhat aromatic smell. It was once a popular remedy in ague and from time immemorial has been used as an emmenagogue. It is employed in infusion and is stimulant and tonic. A double variety is not uncommon in gardens. A related genus is the mayweed or dog fennel (*Anthemis cotula*), with leaves more resembling those of chamomile, but almost scentless, and large flowers, with white rays and yellow disk, very common in grain fields and waste places in America and throughout Europe. A form without the white rays is not uncommon.

FEVER TREE. See PINCKNEYA.

FEVERWORT (fever + wort, root, AS. *wyr*, OHG. *wurz*, Ger. *Wurz*; connected with Lat. *radix*, root), HORSE GENTIAN, or WILD COFFEE, *Triosteum perfoliatum*. A perennial plant of the family Caprifoliaceæ. It has an erect, round, hairy, fistular stem, from 1 to 4 feet high, opposite ovate-lanceolate entire leaves, and axillary whorls of brownish-purple flowers. It is a native of North America, occurring in rich woods from Canada to Alabama and west to Iowa. Its dried and roasted berries have been occasionally used as a substitute for coffee; but it is chiefly valued for its medicinal properties, its root acting as an emetic and mild cathartic. It is sometimes called *Tinker's root*, being named after Dr. Tinker, who first brought it into notice.

FEWKES, fûks, JESSE WALTER (1850-). An American ethnologist, born at Newton, Mass. He graduated at Harvard in 1875, took his degree of Ph.D. there in 1877, and pursued the study of zoölogy at Leipzig (1878-80). He was an assistant at the Museum of Comparative Zoölogy, Harvard, from 1881 to 1889, and secretary of the Boston Society of Natural History from 1889 to 1891, and edited the *Journal of Ethnology and Archaeology* from 1890 to 1894. He directed the Smithsonian archaeological expedition to Arizona, and in 1895 became an ethnologist in the Bureau of American Ethnology. He was in charge of the excavation and repairs of Casa Grande, Ariz., and of Spruce Tree House, Cliff Palace, Colo. (1903-09). His writings comprise pamphlets on marine zoölogy and American archaeology and eth-

nology, including a report on the ceremonies of the Moqui Indians.

FEYDEAU, fâ'dô', ERNEST AIMÉ (1821-73). A French sensational novelist, a mediocre dramatist, and an antiquarian scholar of some distinction, born in Paris. In 1858 he sprang into notoriety with *Fanny*, a daringly realistic study of the psychology of jealousy, to be associated with Constant's *Adolphe*. He wrote also an unfinished *Histoire des usages funèbres et des sépultures des peuples anciens* (1857-61); *Le secret du bonheur* (1864; trans., 1867); sketches of Algerian life: *L'Allemagne en 1871* (1872), a clever but bitter view of Germany; and a splendid life of *Théophile Gautier*. Consult Barbey d'Aureville, *Les Œuvres et les hommes au XIXe siècle* (6 vols., Paris, 1892-99).—His son, GEORGES FEYDEAU (1862-), became known as a brilliant writer of monologues and witty one-act plays.

FEYEN-PERRIN, fe-yân'-pe-rân', FRANÇOIS NICOLAS AUGUSTIN (1826-88). A French genre painter, born at Nancy (Meurthe). He studied under Yvon and Cogniet at the Ecole des Beaux-Arts. A very versatile artist, he chose his subjects from everyday life, such as "A Lesson in Anatomy" (1864, Tours Museum), from history, as "The Finding of the Body of Charles the Bold," and from literature, especially Dante. He also painted studies of the nude, but his series of Breton pictures show him at his best. He has rendered the atmosphere of the sea with fine effect; but his figures, especially his women, are too pretty and elegant for hard-working peasants. Among the most popular of these studies are "Return of the Oyster Fishers" (1874; Luxembourg); "The Winnower" (1867); "Return from Fishing at Low Tide." He received medals at the salons of 1865 and 1874 and the Legion of Honor in 1881.

FEYJÓO Y MONTENEGRO, fâ'-hō'ô & mōn'-lá-nâ-grô, BENITO JERÓNIMO (1678-1764). A Spanish monk, critic, and scholar, born at Casdemiro, a small hamlet in the District of Santa María de Molins, near Orense. He entered the Benedictine Order and lived all his life at one of the monasteries of the order at Oviedo, where he died. He studied not only religion, but mathematics, philosophy, and medicine, and was almost the first to appreciate how far Spain was behind other European countries in these matters. Feyjóo's works included the *Teatro crítico universal para desengañar de errores comunes* (1726-39), which appeared in eight volumes. The *Teatro crítico* has been compared to Addison's *Spectator*, but it is of a weightier quality. Feyjóo wrote about the position of women; the manners of the clergy; the scientific discoveries of Galileo, Bacon, Pascal, and Newton; popular fallacies concerning comets and eclipses; and other matters. In 1739 he ceased to publish the *Teatro crítico*. In 1742 he began *Cartas eruditas y curiosas* (1742-60), which continued the leavening process begun by the other. His complete works were published in Madrid (1780). Despite his obvious faults of style and a general lack of genius, and although he made no great discovery, it would be difficult to exaggerate the importance of his influence in awakening Spain to a realization of her situation and arousing her to interest in educational matters.

FEZ. One of the capitals and the chief city of Morocco, situated about 100 miles south of the Strait of Gibraltar in a valley surrounded

by high hills (Map: Africa, D 1). The city lies on both banks of the Wad Fas, a tributary of the Wad Sebu, which divides it into the two parts of Fez el-Bali, the old town, and Fez el-Jedid. It is a very ill-built town, with narrow, filthy streets, with no sanitary arrangements, which, together with a humid climate and an inadequate water supply, make it unhealthful. The streets are, however, occasionally washed by closing the ordinary exits of the conduits and opening lids which permit the river water to flow into the streets and carry off the accumulated refuse. In its flourishing days Fez had about 90,000 dwelling houses and 800 mosques. Of the latter only about 100 are left. Of these the most important are Muley-Edris, containing the tomb of Edris II (the reputed founder of Fez), and Jama-Karubin, to which is attached one of the highest educational institutions of the Mohammedan world, and which contains a large library of Arabian works on theology. Fez has also a number of minor schools and is still regarded as an important educational centre. The industries are considerable, the products including leather, rugs, shawls of silk, and the red "fez" caps. It was formerly the chief place of manufacture of the red fez cap, the color of which was produced from a dye made from the juice of a berry grown in that vicinity, but the same shade is now produced elsewhere. In point of commerce Fez is the most important city of northwestern Africa. It is the distributing centre for European products from Marseilles and London, while its caravans travel as far as Timbuktu. The population of Fez, formerly about 400,000, is now estimated at 100,000, consisting chiefly of Moors, and with some Arabs, Berbers, and about 10,000 Jews. The foundation of Fez is usually believed to have taken place at the end of the eighth century (793) and is attributed to Edris II. The city was held in high veneration by the Mohammedans and attracted numerous pilgrims. In the thirteenth century it became the capital of an independent state, when it prospered greatly. In the middle of the sixteenth century it passed to Morocco, and since then it has gradually declined.

FEZ. A red brimless felt or wool cap, fitting closely to the head, ornamented with a long tassel, worn in Turkey, Persia, Greece, Albania, Egypt, and on the shores of the Levant generally, and designating a Turkish subject, even if not a Mussulman. This cap has long been the Turkish national headdress. The name was derived from the town of Fez in Morocco, where such caps were first made. In Africa it is called also *turbash*.

FEZZAN, fēz-zān'. A political division of the Italian Province of Tripoli (q.v.) in north Africa. Prior to the annexation of Tripoli by Italy in 1912 it was a lieutenant governorship of the Turkish Vilayet of Tripoli (Map: Africa, F 2). It is an extensive group of oases occupying the southern portion of the vilayet, with a total area of about 156,000 square miles. The greater portion of the surface consists of hills of black quartz sandstone, among which the most prominent are the Jebel-es-Soda, or Black Mountains, running from east to west for a distance of about 170 miles and not exceeding 3000 feet in altitude. The northwestern part of the country is an elevated waterless plateau known as Hammada-el-Homra, while the southern portion is a desert. The rivers are insigni-

ficant, and vegetation is found mainly along the wadies, or dried-up river courses, where also are located the chief centres of population. The chief of these wadies are the Shati, lying between lat. 27° and 28° N., and the Sherki, situated south of the Shati, the centre of the most fertile section of Fezzan. The climate is hot and dry in the summer and cold in the winter. Not more than a tenth of the area is cultivable. In the neighborhood of the villages, which are situated mainly in the wadies, wheat, barley, etc., are grown partly with the aid of artificial irrigation. The date is the principal article of food. Large numbers of camels and horses are raised. The population is estimated at a little over 70,000. The inhabitants are a mixed race, of a brown color, generally well formed, and in many respects resembling the negro. The original inhabitants belonged to the Berber family, but since the invasion of the country by the Arabs the traces of this native north African element have gradually disappeared. The chief elements in the population are Tuaregs, Arabs, Moors, and negroes. The language spoken is a corrupt mixture of Berber and Arabic. The capital is Murzuk (q.v.). Fezzan is the Phazania of the ancients, and was conquered in 19 B.C. by the Romans under the proconsul L. Cornelius Balbus. Christianity was introduced at the end of the sixth century, but with the conquest of the territory by the Arabs at the end of the seventh century Mohammedanism took its place. The territory was governed by its own princes under the suzerainty of the Arabs and subsequently became a tributary state of Tripoli. With the extinction of its dynasty of rulers, Fezzan became, after a period of internal uprisings and usurpations, a dependency of Tripoli. On the annexation of Tripoli by Italy in 1912 Fezzan was considered a part of that territory, and portions of its area were occupied by the Italian army in 1913 without serious opposition on the part of the inhabitants.

FIACRE, fyā'kr', or **FIACHRACH**, SAINT (†-c.670). A monk of France in the seventh century. He was born of noble parents in Ireland. He became an anchorite and then left his native country with some companions for France. They were kindly received by Faro, Bishop of Meaux, who gave him a residence in the forest of Breuil, in Brie, the region south of Meaux, where Fiacre built a cell and gave asylum to such strangers as fell in his way. Many stories were told of his miracles, and after his death his shrine had the reputation of working miracles, and pilgrimages to it began. His festival day is August 30. St. Fiacre is the patron saint of gardeners. The proprietor of the Hôtel de Saint-Fiacre, in the Rue Saint-Martin, Paris, opened the first livery stable in Paris in 1640. A statue of the saint stood over the door, and this circumstance gave the name *fiacre* to a public carriage in France.

FIALA, fē-ā-lā, ANTHONY (1869-). An American Arctic explorer, born in Jersey City, N. J., and educated at Cooper Union and the National Academy of Design, New York City. In early life he was engaged in various employments—as lithographic designer, chemist, cartoonist, head of the art and engraving department of the Brooklyn *Daily Eagle* (1894-99), and correspondent for that paper while serving as a trooper in the Spanish-American War. In 1901-02 he accompanied the Baldwin-Ziegler

polar expedition as photographer; in 1903-05 he was in command of the expedition sent out by Ziegler from Tromsø in July, 1903. The party reached 82° 4' N., and surveyed the Franz Joseph Archipelago, but lost their ship, *America*, in Teplitz Bay and failed to reach the pole. A relief party sent out under William S. Champ found Fiala and his men at Cape Dillon in July, 1905, and brought them home. In 1914 Fiala accompanied Theodore Roosevelt on his expedition into hitherto unexplored parts of Brazil. He wrote *Troop "C" in Service* (1899) and *Fighting the Polar Ice* (1906).

FIALIN, J. G. V. See PERSIGNY, DUC DE.

FIAMMETTA, fyám-mët'tá. The name given by Boccaccio to his ladylove, believed to be Maria, daughter of Robert, King of Naples.

FIAMMINGO, PIETRO. See VERSCHAFFELT.

FIASCO (a flask or bottle). A term borrowed from the Italian theatre, signifying a failure to please on the part of an actor or singer. The word has been extended to cover any ignominious failure or disappointment. Its application, however, is not quite clear.

FIAT (Lat., let it be). In English legal procedure, an indorsement of a judge, master, or registrar upon an application for an order or rule, which serves in lieu of a formal order. The purposes for which it may be employed are strictly limited, and it is chargeable with a smaller fee than an order which is drawn up in due form. The term is also applied to the formal leave of the Attorney-General to take certain proceedings, indorsed upon an application. It is best known in connection with bankruptcy proceedings, the order of the court directing that a commission in bankruptcy issue having long been known as a "flat in bankruptcy." Its use in this sense has, however, been abolished by statute.

FIAT MONEY. Inconvertible paper money, not even containing a promise to pay, but issued by the state with the bare assertion of its identity with true money, although no provision is made for its exchange for specie. Fiat money was issued by the American Colonies to a considerable extent, and the history of its rapid depreciation and final worthlessness is well known. When a government is forced to this measure, the state of its finances is virtually bankruptcy. The name "flat money" was first given to irredeemable paper currency during the Greenback agitation in the United States after the Civil War, from the claim of the Greenback party that the fiat of the government could give value to a circulating medium.

FIBICH, fě'bik, ZDENKO (1850-1900). A Bohemian composer. He was born at Všebořic, near Opatowitz, Dec. 21, 1850. His musical talent showed itself very early, so that even before his fourteenth year, and before having taken up music as a serious study, he wrote a symphony. From 1865 to 1867 he studied at the conservatory in Leipzig under Moscheles, Richter, and Jadassohn, and also came strongly under the influence of Schumann's music. After a year in Paris he went to Mannheim in 1869 and studied a year with Vincent Lachner. Returning to his native country, he established himself as a teacher at Wilna, until in 1876 he became conductor at the National Theatre in Prague, which post he resigned in 1878 to accept the position of chorus master of the Russian church in the same city. In 1881 he also

gave up this place in order to devote his entire time to composition. He died in Prague, Oct. 10, 1900. Among the Czech composers Fibich occupies a foremost place, being surpassed only by Smetana and Dvořák. The number of his works reaches 700, many in large forms. Among the more important are the operas *Bukorin* (1874), *Blaník* (1881), *Die Braut von Messina* (1884), the melodramatic trilogy *Hipodamia* (1891), *The Tempest* (1895), *Sárka* (1898), *Der Fall Arconas* (1900); four symphonies in G minor, F, E♭, and E minor, the symphonic poems *Othello*, *Toman* and the *Nymph*, *Vesna*, *Zahoj*, *Staroj* and *Luděk*, *Vigilie*; several overtures and choral works with orchestra; chamber music; about 400 pieces for piano, and a large number of songs. Consult C. L. Richter, *Zdenko Fibich* (Prague, 1899).

FIEBIGER, fě'bī-gēr, JOHANNES HENRIK TAUBER (1821-97). A Danish divine and poet, born at Nykjøbing on the island of Falster. His poetic works include: *Johannes den Døber*, a biblical drama (1857); *Kors og Kjerlighed*, a tragedy of domestic life (1858); *Nogle Sagn*, stories in verse (1865); *Den evige Strid*, a tragedy (1878), quite popular; *Graubroderen*, a narrative in 16 cantos (1882); and a collection of poems (1884); His autobiography appeared in 1898.

FIBONACCI, fě'bō-nā'ché, LEONARDO, called LEONARDO PISANO. One of the greatest mathematicians of the Middle Ages. He flourished at the opening of the thirteenth century, but little is known of his personal life. He early acquired a love for mathematics and science and perfected his knowledge on his journeys to the Barbary coast, Egypt, Syria, Greece, and Sicily. Following are his chief works: *Liber Abaci*, composed in 1202, of which only a second edition is extant; *Practica Geometrie*; *Liber Quadratorum*; *Flos*, treating of the cubic equation; a letter to Theodorus, philosopher to the Emperor, relating to indeterminate analysis and to geometry. Fibonacci's name attaches to a certain series, important in the theory of numbers, viz., 0, 1, 1, 2, 3, 5, 8, 13 . . . , in which $u_{n+2} = u_{n+1} + u_n$. This series has many interesting properties; e.g., (1) the sum of the first $n + 1$ terms, $u_0, u_1, u_2, \dots, u_n$, increased by 1, equals u_{n+2} ; (2) the square of any term is one unit less than the product of the two adjacent to it. The works of Fibonacci were published by Prince Boncompagni (2 vols., Rome, 1857-62). Consult: Lucas, *Recherches sur plusieurs ouvrages de Léonard de Pise et sur diverses questions d'arithmétique supérieure* (ib., 1877); Bonaini, *Memoria unica sincera di Leonardo Fibonacci* (Pisa, 1858) and *Iscrizione collocata nell' archivio di stato in Pisa a onore di Leonardo Fibonacci* (ib., 1867); Milanese, *Documenti inediti e sconosciuti intorno a L. Fibonacci* (Rome, 1867); Boncompagni, *Intorno ad alcune opere di Leonardo Fibonacci* (ib., 1854).

FIBRE (Lat. *fibra*, filament). A term of very common use as applied to objects of a stringy or threadlike character, whether of the animal, vegetable, or mineral kingdom. Minerals are often described as of a fibrous structure or appearance, in which there is, however, no possibility of detaching the apparent fibres from the general mass, or in which they are inflexible, and brittle if detached; but a more perfect example of mineral fibre is found in amiantus, a variety of asbestos. For the scien-

tific use of the term "fibre" with regard to the animal kingdom, see the article **MUSCLE AND MUSCULAR TISSUE**; for its scientific use with regard to the vegetable kingdom, see **VEGETABLE TISSUE**; **WOOD**. In its more popular but perfectly accurate use it includes the hair or wool of quadrupeds, the silken threads of the cocoons of silkworms and other insects, the fibres of the leaves and of the inner bark of plants, and the elongated cells or hairs connected with the seeds of plants, the ordinary materials of cordage, and of textile fabrics.

Of mineral substances, amiantus alone has been used for textile fabrics, and that only to a very limited extent. Animal and vegetable fibres have, from the earliest ages, supplied man with cordage and with cloth. How the invention took place can only be matter of conjecture. It is noted as an interesting fact that the most valuable commercial fibres of to-day were the prominent fibres of ancient times. Cotton, flax, hemp, as well as the common animal fibres, as hair, wool, and silk, were known and used in past ages.

The animal fibres used for textile purposes are chiefly of the two classes already mentioned, (1) the wool or hair of quadrupeds and (2) the silk of the cocoons of insects. To these may be added (3) the byssus of mollusks, but this class contains only the byssus of the pinna (q.v.) of the Mediterranean, an article of ancient and high reputation, but more of curiosity than of use. The skins and intestines of animals, although sometimes twisted or plaited for various uses, can scarcely be reckoned among the fibrous materials afforded by the animal kingdom. For information regarding the fibres obtained from the cocoons of insects, see **SILK**; **SILKWORM**. It is to the first class that the greater number of different kinds of animal fibres used for textile purposes belong; and the wool of the sheep far exceeds all the rest in importance. But the wool or hair of other quadrupeds is also to some extent used, as that of the goat, the alpaca, the camel, the musk ox, and the yak, all of which are, like the sheep, ruminants. The hair of comparatively few animals is sufficiently long for textile purposes or can be procured in sufficient abundance to make it of economic importance. The warmth of clothing depends much on the fineness of the hair, and on other characters in which wool particularly excels. See **SHEEP**; **WOOL**; **GOAT**; **ANGORA**; **ALPACA**; **CAMEL**; **MUSK OX**; **YAK**.

The useful vegetable fibres are far more numerous and various than are the animal. They are obtained from plants of natural orders very different from each other. They are obtained also from different parts of plants. Wood cells are found in the bark, and are longer, finer, and tougher than those found in the wood. They form the principal part of the fibrous bark or bast layer of cells. These give toughness and flexibility to the structure, and the extracted bundles of cells form the filamentous product known as flax, hemp, and jute, derived from dicotyledonous plants. In monocotyledons the fibrous cells are built up with others into a composite structure known as fibrovascular bundles. Such fibre occurs in the palms and in the fleshy-leaved agaves, the bundles being found, not as in bark, but throughout the stem or leaf forming the supporting structure. These filaments, when separated from the soft cell mass by which they are surrounded, may be

known as structural fibre, of which the fibre of sisal hemp is an example. The simple cells produced on the surfaces of the seeds of endogens, such as cotton and coconut, constitute a fibrous material, to which the name "surface fibre" has been given. For illustrations, see **PLATE OF FIBRE PLANTS** under article **HEMP**.

The fibre bundles, therefore, whether occurring as bast fibre or structural fibre, or whether in the form of simple cells, as surface fibre, may be regarded as the spinning units—aggregations of bundles purified and cleansed of all extraneous matter and simply twisted together. The mass of cellular structures separating the fibres is removed in the process of cleaning. The fibres of the leaves of endogens, being parallel to each other, are easily obtained of sufficient length for economical purposes; while the reticulated fibres of leaves of exogens, even if long enough, which is comparatively seldom the case, cannot be separated for use. The best fibres of exogens, however, are often of sufficient length and easily separated. The separation is generally accomplished by steeping in water or by frequent dampening with water so as to cause a partial rotting of the other parts of the bast and of the bark which covers it. Since the fibres of endogens are in general discolored and injured by this damp process to a much greater degree than are those of exogens, mere mechanical means are usually preferred for their separation, such as beating, passing between rollers, and scraping. The fibres of many leaves are separated by scraping alone. The fibres of seeds, as cotton, exist in nature attached to the seed, like the wool or hair of animals, and require merely to be collected and cleaned.

A method of separating animal and vegetable fibres in woven materials is based upon the fact that alkalis destroy the former, and have little effect upon the latter. The alkali used is generally caustic potash of 5 per cent strength. If a wool-cotton or a silk-cotton mixture is boiled in this solution for about 15 minutes, the wool or silk is destroyed and the cotton is little affected. The test may be made quantitative. The most accurate results are obtained by removing dressing or finishing substances from the material before applying the test.

There are two natural groups of fibres—the commercial species and the vast group of the so-called native fibres. Among the uncivilized races many species of fibre plants which civilized man cannot afford to employ commercially have become most useful for utensils, cords, and clothing. While 30 or 40 species of plants supply the world's demand for commercial fibres, hundreds of fibrous plants could readily be enumerated. The list of commercial fibres may be increased from time to time. Of those now important there are six bast fibres, as follows: Flax (*Linum usitatissimum*); China grass (*Bahmeria nivea*); hemp (*Cannabis sativa*); jute (*Corchorus capsularis* and *Corchorus olitorius*); Sunn hemp (*Crotalaria juncea*); and Cuba bast (*Nibiscus tiliaceus*). There are two surface fibres: Cotton (*Gossypium* spp.) and raffia (*Raphia pedunculata*). The list of structural fibres numbers 15, representing agaves, palms, and grasses as follows: Cordage fibres—Sisal hemp (*Agave rigida* var.); Manila hemp (*Musa textilis*); Mauritius flax (*Persea gigantea*); New Zealand flax (*Phormium tenax*). Brush fibres—Lampico or istle (*Agave*

heretacantha); Bahia piassaba (*Attalea funifera*); Para piassaba (*Leopoldinia piassaba*); Mexican whisk, or broom root (*Epicampes macroura*); cabbage palmetto (*Sabal palmetto*). *Upholstering and matting fibres*—Crin végétal (*Chamaecrops humilis*); Spanish moss (*Tillandsia usneoides*); saw palmetto (*Serenoa serrulata*); coconut fibre (*Cocos nucifera*). *Paper manufacture*—Esparto grass (*Stipa tenacissima*), a substitute for bath sponges; and vegetable sponge (*Luffa aegyptica*).

The sources of supply of these fibres are as follows: Flax is produced chiefly in Belgium, Russia, Austria-Hungary, Holland, Italy, Great Britain and Ireland, the United States, and Canada; China grass, or ramie, comes from China; hemp is obtained from Russia, United States, France, Belgium, Germany, Austria-Hungary, Italy, and the Netherlands; jute from India and Cuba; bast from the West Indies; cotton is chiefly produced in the United States, Egypt, and Peru; raffia comes from Africa; sisal hemp is produced in Yucatan, Cuba, and the Bahamas; Manila hemp is a product of the Philippine Islands; Mauritius, or aloë, fibre comes from Africa; New Zealand flax from the country indicated by its name; Tampico, or istle, is a Mexican product; Bahia or Para piassabas, or "bass" fibres, are collected from Brazilian palms, other species of bass from African palms; broom root is a Mexican product; the two palmetto fibres are produced from species of Florida palms; crin végétal is derived from an allied palm, growing in Algeria; vegetable hair from Spanish moss is prepared in South Carolina and the Gulf States; coconut fibre comes from the East Indies; esparto grass is produced in Algeria, Spain, and Portugal; vegetable sponge largely in Japan. Other fibrous substances appear in the form of straw plait from Italy, Japan, and China chiefly. The Eastern floor mattings and basketry are made from various fibres.

The highest use for which fibre may be employed is in the manufacture of cloth or woven fabric. The next higher uses are in the manufacture of threads, twines, cords, and ropes known as cordage. A third use is in the manufacture of brushes and brooms, for which a different class of fibre than either the fabric or cordage fibres is employed. Fourth, fibres are used in the manufacture of many plaited or coarsely woven articles employed in domestic economy, some of which are of commercial importance, while the greater number are "native" productions. A fifth form of utility is the employment of fibres or fibrous substances in mass as filling material, for stuffing pillows, cushions, mattresses, furniture, etc., or as packing substances. A sixth and exceedingly important use is in the manufacture of paper. For further information, consult: Watt, *Dictionary of Economic Products of India* (Calcutta, 1889); Morris, *Commercial Fibres* (London, 1895); "Vegetable Fibres," *Kew Royal Gardens* (ib., 1898); Dodge, "Useful Fibre Plants of the World," *United States Department of Agriculture, Fibre Investigations, Report No. LX* (Washington, 1897); Georgievics, *Chemical Technology of Textile Fibres* (New York, 1902); Matthews, *Textile Fibres* (3d ed., ib., 1913); Mitchell and Prideaux, *Fibres Used in Textiles and Allied Industries* (ib., 1911). See FLAX; JUTE; RAMIE.

FI'BRIN (from Lat. *fibra*, fibre). A proteid

substance somewhat similar to myosin and globulin (see GLOBULINS), from which it may be readily distinguished by its insolubility in dilute acids and alkalies as well as in dilute solutions of common salt. By the action of pepsin or of trypsin fibrin is converted into certain forms of globulin. Fibrin may be obtained from blood by beating or stirring with a bundle of twigs, to which the fibrin adheres in strings. The impure substance thus obtained is rinsed with water and may be boiled with alcohol and ether, to remove fatty matters. The properties of fibrin depend to some extent on the manner in which this method of preparation is carried out, and Denis succeeded in obtaining three distinctly different forms of fibrin. Fibrin has the peculiar property of decomposing peroxide of hydrogen without itself undergoing any chemical change.

FIBRIN'OGEN. See GLOBULINS.

FI'BROLITE. A variety of sillimanite, noted for its fibrous structure. The name was formerly used to denote the entire species.

FIBRO'MA. See TUMOR.

FI'BROSARCO'MA. See TUMOR.

FI'BROVASCULAR BUNDLE (*fibro*, from Lat. *fibra*, fibre + *vascular*, from Lat. *vasculum*, little vessel, dim. of *vas*, vessel). A strand of conducting tissue in ferns and seed plants, which are therefore called vascular plants. The bundle usually comprises both wood (xylem) and bast (phloem) in various relations to each other. The term "fibrovascular" was given because there are usually some fibres associated with the vessels; but now the bundles are called simply vascular bundles, because the fibres referred to are of different origin and are not characteristic. See MORPHOLOGY OF PLANTS; FIBRE.

FIB'ULA. See LEG.

FIBULA. The name given by the Romans to the brooch. See FIBULA PRÆNESTINA.

FIBULA PRÆNESTINA (Lat., Præneste brooch). A gold brooch found in 1886 at Præneste. It bears a retrograde inscription in Old Italic characters, which is the oldest extant specimen of Latin, dating probably from the sixth century B.C., and which is important as showing *fh* for *f*, *s* for later *r* between vowels, the reduplicated perfect, the use of the dative singular ending *-oi* and the early use of the accusative ending *-ā*. The inscription reads: MANTOS MED FIEFHAKED NUMASIOI, which is equivalent to classical Latin *Manius me fecit Numasio* or *Numario* (Manius made me for Numasius or Numarius). Consult *Corpus Inscriptionum Latinarum*, xiv, 4123 (Berlin, 1887), and Egbert, *Latin Inscriptions* (New York, 1896).

FICHEL, fê'shêl', EUGÈNE (1826-95). A French genre painter, born in Paris. He was a pupil of Paul Delaroche and at first painted historical subjects, such as "Harvey Demonstrating the Circulation of the Blood to Charles I" (1850). He subsequently adopted the miniature style of Meissonier with its great care in finish and archaeological exactness, combining with it a kind of delicate humor. Among his numerous works are: "The Arrival at the Inn" (1863); "The End of Dinner" (1872); "The Council of War" (1890); "The Breakfast" (Lille Museum); "Amateurs Visiting a Painter" (Grenoble); "The Chess Players," and "The Encyclopædists" (Amsterdam).

FICHET, fê'shâ', GUILLAUME. A French

scholar of the fifteenth century. In 1467 he was elected rector of the University of Paris, and he installed in the Sorbonne the first printing press ever set up in France, with the aid of three printers who came from Mainz to assist him in this work. The first book printed was *Lettres de Gasparino* (1470). Some of Fichte's own books followed, such as *Fichti Guillelmi Artium et Theologiae Doctoris, Rhetoricorum libri III* (1470), and *Fichti Guillelmi Epistolae* (1471). Consult Philippe, Guillaume Fichte, sa vie et ses œuvres: Introduction de l'imprimerie à Paris (Annecy, 1892).

FICHTE, fik'te, IMMANUEL HERMANN VON (1797-1879). A German philosopher, son of Johann Gottlieb Fichte. He early devoted himself to philosophical studies, being attracted by the later views of his father, which he considered essentially theistic. He also attended the lectures of Hegel, but felt averse to what he deemed to be his pantheistic tendencies. Occupied at first as a teacher, Fichte was appointed professor of philosophy in Bonn in 1836, and from 1842 to 1867 held a chair in the University of Tübingen. The most important of his many works are: *Beiträge zur Charakteristik der neuern Philosophie* (1829; 2d ed., 1841); *System der Ethik* (1850-53); *Anthropologie* (1856); *Die theistische Weltansicht und ihre Berechtigung* (1873). The great aim of his speculations was to find a philosophic basis for the personality of God, and for his theory on this subject he proposed the term "concrete theism." The regeneration of Christianity, according to him, would consist in its becoming the vital and organizing power in the state, instead of being occupied solely, as heretofore, with the salvation of individuals. Consult Seherer, *Die Gotteslehre von I. H. Fichte* (Wien, 1897), and a centennial article by Eucken in 1897 in the journal Fichte had founded in 1837, *Zeitschrift für Philosophie*.

FICHTE, JOHANN GOTTLIEB (1762-1814). An illustrious German philosopher. He was born, the son of a ribbon weaver, at Rammenau, in Upper Lusatia, May 19, 1762. As a lad of promise, he attracted the attention of a neighboring nobleman, Baron von Miltitz, who assisted him in his early education. In 1780 he entered the University of Jena, where, as subsequently at Leipzig, he studied theology and philosophy, supporting himself by tutoring. During the years 1784 to 1788 he acted as tutor in various Saxon families. From 1788 to 1790 he taught in private families at Zurich, where he became acquainted with Pestalozzi. He then returned to Leipzig and in 1791 obtained a tutorship at Warsaw, in the house of a Polish nobleman. The situation, however, proved disagreeable, and the philosopher next proceeded to Königsberg, where he had an interview with Kant, of whom he had become an ardent disciple. He submitted his *Versuch einer Kritik aller Offenbarung* (A Tentative Critique of all Revelation) to that philosopher, who praised it highly and advised him to publish it. The following year it appeared anonymously and was credited to Kant, who then made known its authorship. This incident established Fichte's fame as a philosopher. In 1793 he married Johanna Maria Rahn, a niece of Lavater, and the following year he was appointed to the chair of philosophy at Jena, where he began to expound with extraordinary zeal his system of "transcendental idealism." In 1795 he pub-

lished *Ueber den Begriff der Wissenschaftslehre* (Concerning the Idea of the Theory of Science), and followed it almost immediately with *Grundlage und Umriß der gesamten Wissenschaftslehre* (Foundation and Outline of the Entire Theory of Science), in which he clearly broke away from Kant, whose speculations did not seem to him sufficiently thorough. In 1796 he published *Grundlage des Naturrechts* (Foundation of Natural Law); in 1798, *System der Sittenlehre* (System of Ethics), and in the same year an article in a philosophical journal, which cost him dear. It was entitled "Ueber den Grund unsers Glaubens an eine göttliche Weltregierung" (The Basis of Our Belief in a Divine Government of the World). For views therein expressed he was charged with atheism, inasmuch as he had characterized God as the moral order of the world. In vain did he deny the atheistic nature of this doctrine; the *odium theologicum* was too strong for him, and he was compelled to relinquish his chair. The feeling against him had extended far beyond the Grand Duchy of Saxe-Weimar. Indeed, Prussia was the only German state that had not joined in demanding his resignation from Jena. Accordingly Fichte went in 1799 to Berlin, where he delivered lectures to audiences composed of men of distinction, and where he made friends of such men as Schlegel, Schleiermacher, and Tieck. In 1805 he was appointed to a professorship in Erlangen. The approach of the French army drove him in 1806 to Königsberg, and in 1807-08 he delivered his famous "Addresses to the German Nation" (*Reden an die deutsche Nation*) in Berlin. These addresses were full of the most exalted enthusiasm. The Prussian King appreciated the zeal of the eloquent metaphysician, and on the restoration of peace appointed him to a professorship in the newly founded University of Berlin. In 1810 the university was opened with a host of brilliant names—Fichte, Friedrich August Wolf, Wilhelm von Humboldt, De Wette, Schleiermacher, and Savigny. By the votes of his colleagues Fichte was unanimously elected rector. In 1813 the War of Liberation broke out, and the hospitals of the Prussian capital were soon crowded with patients. Fichte's wife was one of the first to offer her services as a nurse. For five months she tended the sick with all the patient tenderness and devotion of her nature. At last she was seized with typhoid fever, and after a fearful struggle she recovered; but her husband caught the infection, and died Jan. 27, 1814.

The fundamental notion of the idealism set forth in Fichte's writings, at least in the earlier of them, is the sole reality of the conscious self or ego, which gives rise by its activity to the not-self or non-ego, inasmuch as self-knowledge is possible only in contrast with knowledge of a non-ego. The significance of this view in the history of philosophy can be understood only by comparing it with Kant's (q.v.), from which it was developed. Kant had taught that experience arose from the concurrent action of sensation and thought, sensation being the product of things in themselves as they affect the mind, while thought is the spontaneous activity of the conscious self. Thus, experience for Kant is dualistic. This dualism is what Fichte sought to overcome, and he set about it by denying that the sense element in experience is traceable to the action of objects independent of the percipient subject. The non-

ego is the creation of the ego. This creation is not accomplished at the instigation of some external stimulus. It is an original, uncaused, free activity of the self. The first result of this activity is sensation. The act of giving rise spontaneously to sensation is an unconscious act; its effect is the first object of consciousness. Because the act is unconscious, its result seems to be obtruded upon consciousness from without, a well-known characteristic of sensation. Why does the self create a sense object? In order to give free play to its activity. It sets up an object as a limit only to transcend this limit. This is done in the successive stages of knowledge, beginning with perception and ending with the categorical imperative, which is the termination of the process, because at this point the self is conscious of *itself* (not of some apparently alien obtrusion), as *giving to itself* all its determinations. The ego, in so far as it is determined by knowledge, is the intelligent ego, and, as such, the subject of theoretical science; the ego, on the other hand, as determining the non-ego, is the subject of practical science. To recapitulate, Fichte makes that which, from the standpoint of ordinary consciousness, we call the world, merely a product of the ego; it exists only through the ego, for the ego, and in the ego. The ego, however, is not held by Fichte to be the phenomenal self—i.e., the limited temporal self which each person takes himself to be. On the contrary, the creative ego is a universal self common to all finite selves. Abstraction must be made from the finitude of our individual selves, for finitude is itself a self-imposed limit to be transcended. The universal self thus reached is God. A popular exposition of his philosophy is given in his *Anweisung zum seligen Leben*. It is set forth in a strictly scientific manner in the lectures published in the *Nachgelassene Werke*, edited by I. H. Fichte (3 vols., Bonn, 1834-35), in which his *Speculative Logik* and his revised theory of law and morals are particularly deserving of attention. Although Fichte never, strictly speaking, formed a school, and although his system has been adopted only by a few, such as J. B. Schad, Mehmel, Cramer, Schmidt, and Michaelis, his influence upon the subsequent development of German philosophy has been very important, especially through the influence he exerted upon Hegel (q.v.). But of recent years there is a tendency among many idealists to go back to Fichte, discarding Hegel's dialectic. Of this tendency Münsterberg (q.v.) is the best-known representative in America. Fichte's collected works were published by his son, I. H. Fichte (1845-46). His popular works have been translated into English. Their titles are: *The Destination of Man; The Vocation of the Scholar; The Way to the Blessed Life; The Characteristics of the Present Age; Outlines of the Doctrine of Knowledge*. A. B. Kroeger translated: *The Science of Knowledge* (1889); *The Science of Rights* (1869; 2d ed., 1889); *The Science of Ethics as Based on the Science of Knowledge* (1897). Some of the shorter works have appeared in translations from time to time in the *Journal of Speculative Philosophy*. Consult: Kuno Fischer, *Geschichte der neuern Philosophie*, vol. v (Heidelberg, 1897 et seq.); id., *Fichte's Leben, Werke und Lehre* (ib., 1900); Adamson, *Fichte* (London, 1881); Everett, *Fichte's Science of Knowledge: A Critical Exposition* (Chicago, 1884); Carrière, *Fichte's Geistes-*

entwicklung u. s. w. (München, 1894); Schneider, *Johann Gottlieb Fichte als Socialpolitiker* (Halle, 1894); Lindau, *Fichte und der neuere Socialismus* (Berlin, 1900); Weber, *Fichte's Socialismus und sein Verhältniss zur marx'schen Doktrin* (Tübingen, 1900); Léon, *La philosophie de Fichte* (Paris, 1902); Gutman, *Fichte's Sozialpädagogik* (Bern, 1907); and the leading histories of philosophy, such as Erdmann's, Ueberweg-Heinze's, Windelband's, and Falckenberg's.

FICHELGEIRGE, fik'tel-ge-bér'ge (Ger., Fir Mountains). A mountain range of Germany, situated in Upper Franconia, Bavaria (Map: Germany, D 3). It occupies a central position between the northwest-southeast ranges of the Thüringer Wald, Franken Wald, and Böhmer Wald, and the ranges of the Franconian Jura, Elstergebirge, and Erzgebirge, which have a northeast-southwest trend. The Fichtelgebirge is the eroded remnant of an old plateau, which at present has an extreme elevation of about 3400 feet and occupies an area of 380 square miles. Schneeberg, the highest peak, is about 3450 feet above sea level, while Ochsenkopf, Nusshardt, and Farnleite are more than 3000 feet. The main chain is bordered on the north and south by the small groups of the Waldstein and the Weissenstein. Geologically the Fichtelgebirge consists of granites, gneisses, and schists of Archæan and Paleozoic age. Rich deposits of copper, lead, and iron ores were the bases of an important metallurgical industry at one time, but they are now practically exhausted. In the more elevated portions the climate is raw and moist and suited only to the cultivation of the hardier grains and to pasturage, but in the lower parts there are delightful watering places, as Alexandersbad. Cut stone, lumber, and cotton and woolen manufactures are the principal products. The range forms the watershed between the Eger, the Main, and the Naab, and is thus drained by the great river systems of the Elbe, Rhine, and Danube.

FICINO, fĭ-chĕ'nō, MARSTILO (1433-99). An Italian philosopher of the Renaissance. He was born in Florence, the son of the principal physician of Cosmo de' Medici, and to the liberality of this Prince he owed the classical culture which inspired his future career. After some years of enthusiastic study he appeared as a public teacher of Platonic philosophy and was chosen by Cosmo to preside over his newly founded Platonic Academy. He translated into Latin Plato's own works and those of the Neoplatonists Plotinus, Iamblichus, and Proclus, with commentaries. His most important original work was his *Theologia Platonica de Animorum Immortalitate*, in which he gave a systematic presentation of his beliefs. His whole life was devoted to the study and teaching of the Platonic philosophy, which he believed to be, while not perfectly Christian, yet the nearest to the Christian principles, and therefore calculated to win back to Christianity minds which had been led astray by a false philosophy. His collected works, including his translations of Plato and Plotinus, were first published at Basel (2 vols., 1561-76), and his biography by Corsius at Pisa (1771). Consult Symonds, *Renaissance in Italy: The Revival of Learning* (New York, 1888).

FICK, ADOLF EUGEN (1829-1901). A German physiologist. He was born at Cassel and was educated at Marburg and Berlin. He was

lecturer and professor at Zurich from 1852 to 1868 and from 1868 to 1899 professor at Würzburg. His publications include *Die medizinische Physik* (3d ed., 1885) and *Kompendium der Physiologie* (4th ed., 1891).

FICK, AUGUST (1833–). An eminent German philologist. He was born at Petershagen, Westphalia, and studied under Benfey at Göttingen from 1852 to 1857, and then taught in the gymnasium there until his appointment in 1876 to an extraordinary professorship of comparative philology in the university. In 1887 he became professor at Breslau. His greatest work is the *Vergleichendes Wörterbuch der indogermanischen Sprachen*, vols. i, ii (4th ed., 1890–94). Other works are: *Die griechischen Personennamen* (2d ed., 1894); *Die ehemalige Spracheinheit der Indogermanen Europas* (1875); *Die homerische Ilias, in der ursprünglichen Sprachform wiederhergestellt* (1886); *Gesammelte Schriften* (4 vols., 1903–06); *Vorgriechische Ortsnamen* (Göttingen, 1905); *Haltiden und Danabier in Griechenland; weitere Forschungen zu den Vorgriechischen Ortsnamen* (ib., 1909); *Die Entstehung der Odyssee und die Versabzählung in den griechischen Epen* (ib., 1910). His pupils and friends issued a volume entitled *Tópas* in honor of his seventieth birthday (ib., 1903).

FICKER, ADOLF (1816–80). An Austrian statistician, born at Olmütz. He was educated at Vienna and in 1873 was appointed president of the Central Bureau of Statistics, of which he had previously been secretary (1853–64) and director (1864–73). He also rendered important services as referee for real-schools and gymnasia in the Ministry of Education. His principal works are: *Die Bevölkerung der österreichischen Monarchie* (1860); *Die Bevölkerung Böhmens* (1864); *Völkerrstämme der österreichisch-ungarischen Monarchie* (1869); *Geschichte, Organisation und Statistik des österreichischen Unterrichtswesens* (1871). He was also the founder of the *Statistische Monatschrift* (1875), now published by the Imperial Bureau of Statistics, Vienna.

FICKER, JULIUS (1826–1902). A German jurist, born at Paderborn and educated at Bonn, Münster, and Berlin. In 1852 he became professor of history and jurisprudence at Innsbruck. He became a member of the Vienna Academy of Sciences in 1866 and retired in 1879. His most important work is entitled *Forschungen zur Reichs- und Rechtsgeschichte Italiens* (1868–74). He wrote also: *Rainald von Dassel, Reichskanzler und Erzbischof von Köln* (1850); *Vom Reichsfürstenstande* (1861); *Beiträge zur Urkundenlehre* (1878).

FICORONI (fē'kō-rō'nā) **CIST, TIME**. The most celebrated of the ancient *ciste* (jewel or toilet caskets) found in Italy. It was discovered near Palestrina (see **PRENESTE**) in 1738. It came into the possession of the Italian antiquarian Ficoroni and was by him presented to the Museo Kircheriano at Rome. The casket is of cylindrical form, about 18 inches high and 12 to 14 inches in diameter, and bears representations of scenes from the story of the Argonauts—the arrival of the Argonauts in Bithynia, and the conquest of Amycus by Polux in a boxing match. These representations are of the finest Greek workmanship. The figures are deeply incised. There are also two inscriptions, which date from the third century B.C., which give the names of the owner and

of the artist. Consult Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909).

FICQUELMONT, fē'kēl'mōn', **KARL LUDWIG, COUNT** (1777–1857). An Austrian statesman and general, son of a Frenchman in the Austrian army. He was born at Dieuze, Lorraine, and entered the military service of Austria in 1793. He participated in all the campaigns against France, rose to the rank of major general, and was Ambassador Extraordinary to Sweden (1814), Tuscany and Lucca (1820), Naples (1821), and Russia (1829), where he was an extremely influential agent of Metternich. In 1839 he was recalled to Vienna to assume the duties of the Foreign Office during the absence of Prince Metternich. After the revolution of March, 1848, he was again in charge of the Department of Foreign Affairs, and had become premier pro tem, when popular feeling against him compelled him to resign (May 3), partly because he had a kinsman, Count Baillet von Latour, in the War Ministry. The following are his principal works: *Aufklärungen über die Zeit vom 20 März bis zum 4 Mai, 1848* (2d ed., 1850) and *Die religiöse Seite der orientalischen Frage* (2d ed., 1854).

FICTION. See **ENGLISH LITERATURE**; **NOVEL**; **ROMANCE**.

FICTION OF LAW (Lat. *factio*, a fashioning, a feigning, from *fungere*, to fashion, to feign). A legal assumption that something is true which is known not to be true or which may be false. The term "legal fiction" is used by Sir Henry Maine in a wider sense than that given to it in the Roman law or by most English-speaking lawyers. He employs it "to signify an assumption which conceals, or affects to conceal, the fact that a rule of law has undergone alteration, its letter remaining unchanged, its operation being modified." In this sense it includes every modification of existing rules of law by judicial decision. It is to this process of changing legal rules by the fiction that judges are simply declaring the law, when, in fact, they are changing it in order to make it conform to the new standards of morality or to the enlarging needs of society, that English common law owes its elastic and progressive character.

Examples of legal fiction, using the term in its narrower sense, are found in the old forms of pleading. In the action for the *conversion* (q.v.) of goods the plaintiff's declaration alleged that he had lost the goods in question and that the defendant had found them. This allegation was generally untrue, but the defendant was not permitted to deny it, the form of action employed, known as the action of *trover* (Fr. *trouver*, to find), being based on the assumption that the defendant was unlawfully detaining chattels of the plaintiff which he had found. By a fiction of pleading the courts of King's Bench and Exchequer came to share in the jurisdiction of the Common Pleas. Originally (as has been pointed out under **COVER** and **EXCHEQUER**, **COVER OF**) the King's Bench was a criminal court exclusively, and its jurisdiction over civil actions was obtained by permitting the plaintiff to allege falsely that the defendant was in the custody of the King's marshal for a breach of the peace. Having brought the defendant before the court on this fictitious charge, the plaintiff was allowed to proceed against him for the civil wrong of which he had actually been guilty, even though

this had involved no breach of the peace or other criminal wrong, the defendant not being permitted to dispute the allegations which gave the court jurisdiction. In a similar manner the Exchequer extended its jurisdiction over civil actions by permitting a plaintiff to allege that he was a debtor of the King and was prevented from paying his debt by the defendant's wrongful act or default. "And these fictions of law," Blackstone observes, "though at first they may startle the student, he will find them upon further consideration to be highly beneficial and useful, especially as this maxim is invariably observed, that no fiction shall extend to work an injury, its proper operation being to prevent a mischief or remedy an inconvenience that might result from the general rule of law." Consult Maine, *Ancient Law* (London, 1887), and the authorities referred to under CONSTITUTIONAL LAW; CUSTOM; JURISPRUDENCE.

FICTOOR, fīk'tōr, JAN. See VICTORS, JAN.

FIGUS. A genus of plants of the family *Moraceæ*, comprising about 600 mostly tropical species, very diverse in habits of growth and in products useful to man. *Ficus elastica* is the rubber plant of greenhouse and conservatory. See BANYAN; FIG; LAC; RUBBER.

FIGUS CAMPUS. See FĒCAMP.

FIGUS RU'MINALIS. The sacred fig tree which protected Romulus and Remus when they were abandoned on the banks of the Tiber. It stood near the Lupercal, at the base of the Palatine Hill (see LUPERCALIA), and, according to the tradition, was miraculously conveyed by the augur, Attus Navius, to the Comitium. Beneath it stood the famous bronze statue of the wolf. The tree is said by Tacitus to have shown no signs of decay until 841 years after it had sheltered the twins. Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed., New York, 1911).

FIDDLE. See VIOLIN.

FIDDLER BEETLE. See FUNGUS BEETLE.

FIDDLER CRAB. A small crab of the genus *Uca* (or *Gelasimus*), enormously abundant on muddy shores along the eastern coast of the United States south of Cape Cod. "The males have one claw very largely developed; the other chela is small. The former is likened to a fiddle, the latter to a bow; and this, together with the waving motion of the large claw, gives them their popular name. . . . The female has claws of small and equal size." The largest, commonest, and most inland-ranging species is *Uca minax*, easily distinguished by having a patch of red at the joints of the legs. Another, extending its range around the Gulf of Mexico and throughout the West Indies, is *Uca pugnax*. A third species (*Uca pugilator*) is more marine, inhabiting sandbars and beaches. All are gregarious, congregating in the salt marshes in countless numbers and making burrows in the mud, just above the line of high tide. These holes are from ½ inch to 2 inches in diameter. The crabs occupy them as refuges, and *Uca minax* forms of pellets of mud an arched penthouse over its hole, in which it sits and watches what goes on. All the species wander about a good deal, and when alarmed scuttle sidewise with comical speed into the first burrow they come to. They are vegetarians, feeding on minute algæ, etc., which they scrape up and put into the mouth with the smaller claws. The burrowing of this crab often does serious injury to

embankments, particularly the levees near the mouth of the Mississippi. Consult Verrill, *Invertebrates of Vineyard Sound* (Washington, 1874), reprinted in Goode, *Fishery Industries*, Section I (Washington, 1884), and Arnold, *The Sea Beach at Ebb-Tide* (New York, 1901). See CRAB, and PLATE OF CRABS.

FIDDLER FISH. See GUITAR FISH.

FIDEICOMMISSUM, fī'dé-i-kōm-mis'sūm (Lat., committed to faith, bequest). At Roman law the *fideicommissum* was a trust bequest. During the republican period a valid bequest could be made only in the form of a legacy in a regular testament. It was, however, not unusual for a person, acting in contemplation of death, but not wishing to leave a testament, or not wishing to substitute a new testament for one already made, to charge the person who was to take the inheritance, whether by law or by testament, with the duty of paying a sum of money, or giving some particular thing or things, to a third person; or to charge the person who was to receive a legacy with the duty of transmitting the legacy or some portion of it or of its value to a third person. Such directions might be given in writing (*codicillæ*) or orally, before witnesses or without witnesses; but in no case, before the time of Augustus, was the duty imposed by such a charge anything more than a moral duty. Augustus made all such bequests, however informal, recoverable by action and instituted a special court for trust-bequest cases. During the early Imperial period it became usual to impose upon an heir, by such a trust bequest, the duty of handing over to a third person the entire estate or some fractional part of it (so-called "universal" trust bequest); and it was enacted by the Senate that in such cases the third person should be compelled to accept, in proportion to the share of the estate which he was to receive, the position and obligations of an heir or universal successor. The effect of this whole development was that testation was practically freed from all formalities. In the late Empire a reaction occurred in favor of greater formality; and in the Justinian law a codicil with five witnesses was required for the establishment of trust bequests. Justinian, indeed, enacted that an oral charge imposed upon the heir should be actionable, but excluded all evidence except that of the claimant and the heir, and provided that the heir should be freed upon taking oath that he had received no such charge. *Fideicommissa* were introduced and developed to accomplish ends that could not be accomplished at the Roman law by testament. By a trust of this sort it was possible, e.g., to leave the ownership of an entire estate or of a particular piece of property to one person for a definite term or for life, or subject to a condition subsequent, and then to another person (*substitutio fideicommissaria*). Arrangements of this character are permitted, with limitations, in the Spanish civil code (secs. 781-786) and in the French civil code (secs. 1048-74). In the German Imperial Code the same result is reached through what is termed postinheritance (*nacherbschaft*). In German law *fideicommiss* has become the technical term for an estate permanently entailed. Consult the authorities referred to in the article CIVIL LAW.

FIDEI DEFENSOR. See DEFENDER OF THE FAITH.

FIDELIO, fē-dē'lyō. An opera by Beethoven (q.v.), first produced in Vienna, Nov. 20,

1805; in the United States, Sept. 28, 1839 (New York).

FIDELITY INSURANCE. See **INSURANCE.**

FIDENÆ. An old and important city of Latium, situated on a hill (now Castel Giubileo) on the south bank of the Tiber, about 5 miles north of Rome, on the Via Salaria; it was supposed to have been founded by the Etruscans. It is said that no other city played so important a part in the history of early Rome as did this city. As early as the days of Romulus ill will, with frequent strife, existed between the two cities and continued, with short intervals of peace, until 496 B.C., when the Fidenates were forced to surrender. In 438 B.C. they revolted again, killing the Roman ambassador, and they were not subjugated until 426 B.C., when their city was taken, and they were sold into slavery. During the Republic and the Empire it was only a small country village, of some importance as a post station, but remarkable chiefly for a terrible calamity which occurred during the reign of Tiberius, when about 50,000 persons were killed by the fall of an amphitheatre during a gladiatorial contest. (Consult Tacitus, *Annals*, iv, 62, etc.) No ruins of Fidenæ exist beyond a few rock-cut tombs (pre-Roman) and drains. Consult: Dennis, *Cities and Cemeteries of Etruria*, vol. i (2d ed., London, 1883); Ashby, *Papers of the British School at Rome*, vol. iii (ib., 1906); Nissen, *Italische Landeskunde*, vol. ii (Berlin, 1902).

FIDUCIARY (Lat. *fiduciarius*, relating to a trust, from *fiducia*, trust, from *fidere*, to trust). A legal term designating a person in whom peculiar trust and confidence are reposed by another, or the relation which subsists between such persons, or a liability incurred by one of these persons towards the other. The most important examples of fiduciary relations are those of parent and child, of guardian and ward, of lawyer and client, of physician and patient, of trustee and cestui que trust, of principal and agent, of principal and surety, and of partners. When the relationship does exist, the rule obtains that the fiduciary—the person in whom a special confidence and trust is reposed—is bound to act towards the other party to the relation with the utmost good faith. If he receives a gift from the other, or enters into a contract with him, and its validity is challenged, the burden of proof is upon him to show that he took no advantage of his influence or knowledge, but, on the contrary, that the other acted with perfect freedom as well as with full knowledge of all the facts relating to the transaction. Indeed, in England a much stricter rule than this is applied to gifts from clients to legal advisers made during the continuance of the relationship: they may be set aside upon the application of the client or his personal representatives. In other words, the presumption of undue influence in such a case is conclusive. A trustee or an agent, charged with the sale of property belonging to his cestui que trust or his principal, is not allowed to become the purchaser or to make any secret profit out of the sale.

The term "fiduciary capacity" in the United States bankruptcy statutes has received a narrow construction. By these statutes debts contracted "in any fiduciary capacity" are excluded from the operation of a discharge in bankruptcy. It has been ruled by the United States Supreme Court that the term in this connection includes only debts contracted by technical trustees, i.e.,

trustees appointed by will or by deed or by order of a court, and does not extend to debts owing by agents or attorneys to their principals. Consult: Bigelow, *Elements of Equity, for the Use of Students* (Boston, 1879); Lowell, *The Law of Bankruptcy* (ib., 1899); and the authorities referred to under such titles as **AGENT**; **ETC.**

FIDUS ACHATES, fr'dūs ā-kā'tēz. See **ACHATES**.

FIEDLER, fē'dlēr, **MAX** (1850–). A German orchestral conductor. He was born at Zittau, where he received his first instruction on the piano from his father, a music teacher. From 1877 to 1880 he studied under Reinecke and Jadassohn at the Leipzig Conservatory. In 1882 he became a teacher in the Conservatory at Hamburg, and in 1903 director. At first he appeared as a pianist, but soon organized orchestral concerts of his own, the success of which led to his election as conductor of the Hamburg Philharmonic Society in 1904. In 1907 he appeared as "guest" conductor with the New York Philharmonic Society, and from 1908 to 1911 he was the regular conductor of the Boston Symphony Orchestra. After his return to Germany he resumed his post with the Hamburg Philharmonic Society, and appeared frequently in Berlin and St. Petersburg. As a composer, he made himself known through some chamber music and a symphony in D minor.

FIEF, fēf. See **FEE**.

FIELD (AS., OHG. *fēld*, Ger. *Feld*, field; connected with AS. *foldc*, Icel. *fold*, soil, and ultimately with Gk. *πλατὺς platys*, Lith. *platus*, Skt. *prthū*, broad, and with OHG. *flaz*, Icel. *flatr*, Eng. *flat*). In heraldry (q.v.), the whole surface of the escutcheon or shield on which the "charge" is displayed; sometimes also one of the divisions thereof.

FIELD, CYRUS WEST (1819–92). An American financier, the projector and promoter of the first submarine telegraph cable between Europe and America, born at Stockbridge, Mass. He was the brother of David Dudley Field, the eminent lawyer, and of Justice Stephen J. Field of the United States Supreme Court. At the age of 15, abandoning the idea of a college education, he removed to New York City. At the end of three years he removed to Stockbridge, but two years later he again removed to New York. He was at first in the employ of A. T. Stewart and afterward junior partner in a firm of paper merchants. A disastrous failure having ensued, Field effected a temporary settlement with the creditors and set up in an independent business. Close application finally rewarded his efforts; he took his brother-in-law into partnership, and on Jan. 1, 1853, at the age of 33, retired from active participation in the business, with a fortune of \$250,000.

A meeting with Frederick N. Gisborne (q.v.), a Canadian electrical engineer, in 1854, determined the channel into which Field's indomitable energy was to be turned. Gisborne was in New York attempting to interest capitalists in an undertaking to construct an overland telegraph line across Newfoundland, connecting Cape Ray and Cape Breton by fast steamships or carrier pigeons, and perhaps eventually by a submarine cable under the Gulf of St. Lawrence. Field took Gisborne's plans under advisement and, in studying up the matter, became convinced not only that the scheme was practicable, but that the time was opportune for organizing

a company to lay a transatlantic cable from Newfoundland to Ireland. He was not the first to entertain such an idea, but he was the first to put it into operation. With this more extended purpose in view, Field set to work to interest some of his friends, with the result that in May, 1854, was organized the New York, Newfoundland, and London Telegraph Company, with Peter Cooper as its president. In 1856 the United States government, at Field's request, sent Lieutenant Berryman in the *Arotic*, to take deep-sea soundings along the route of the proposed cable, with the result that the existence of the telegraphic plateau was confirmed. A British expedition under Lieutenant Dayman, sent also at Field's solicitation, further confirmed this fact. In August, 1857, the first attempt at laying the cable was made from Valentia, on the Irish coast. It failed, but in June, 1858, attempts were resumed. Time and again a start was made, but always unsuccessfully, 200 miles being the greatest length laid.

In spite of these disheartening failures Mr. Field did not despair, and in July another attempt was made, this time with success. On Aug. 16, 1858, the first message was transmitted from Queen Victoria to President Buchanan. But even while the success of the undertaking was being celebrated the cable broke. Mr. Field's firm had failed as a result of the panic of 1857, and he was now compelled to go into bankruptcy. Still he did not lose heart, nor give up his faith in the ultimate success of a transatlantic cable. A contract was let to an English construction company, a new cable was constructed, weighing 300 pounds to the mile instead of 107 pounds, the weight of the old cable, and the *Great Eastern*, the largest steamship afloat, was chartered to lay it. On July 23, 1865, the *Great Eastern*, with Mr. Field on board, started westward from the Irish coast, near Valentia, but the cable broke within 600 miles of the Newfoundland coast. On July 13, 1866, the *Great Eastern* started from Valentia on her second, and this time triumphant, voyage. The Newfoundland coast was reached on July 27 without a mishap, and the land connection was successfully made. From this time on communication with Europe by telegraphic cable was undisturbed. The succeeding years were spent by Mr. Field in railroad development. He was one of the original projectors of the elevated railroad system in New York City, resigning its presidency and that of the Wabash, St. Louis, and Pacific Railway in 1880, on retiring from active participation in business. Business reverses troubled his last years. Consult: Isabella Field Judson (his daughter), *Cyrus W. Field: His Life and Work* (New York, 1896); also H. M. Field, *Story of the Atlantic Telegraph* (ib., 1878; 1903); Reid, *The Telegraph in America* (ib., 1878); Bright and Bright, *Life of Sir Charles Tilston Bright* (London, 1898); Russell, *The Atlantic Telegraph* (ib., 1898).

FIELD, DAVID DUDLEY (1781-1867). An American Congregational clergyman and historical writer. He was born in East Guilford, now Madison, Conn., graduated at Yale in 1802, and held pastorates at Haddam, Conn., and Stockbridge, Mass. He wrote *A History of the Town of Pittsfield, in Berkshire County, Massachusetts* (1844), and a *Genealogy of the Brainerd Family* (1857). His four remarkable sons (David Dudley, Stephen Johnson, Cyrus West, and Henry Martyn Field) are separately treated.

FIELD, DAVID DUDLEY (1805-94). An eminent American jurist and law reformer, son of David Dudley Field (q.v.), a Congregational clergyman. He was born at Haddam, Conn., graduated at Williams College in 1825, studied law first in Albany, N. Y., and afterward in New York City, and was admitted to the bar in 1828. He commenced practice in New York and speedily acquired a leading position at the bar. This was due quite as much to his extraordinary energy and public spirit and to his zeal for law reform as to his unusual learning and skill as a lawyer. Though possessed of a large professional practice, he devoted all the time which he could spare from pressing engagements for 40 years to the reform of the law. He began the movement by writing articles in reviews and papers and pamphlets, showing the urgent necessity of a reform in methods of legal procedure. Having been appointed in 1847 a commissioner on practice and pleading by the Legislature of New York, he devoted himself first to the preparation of a code of civil procedure which was promptly enacted into law. The design of the new system was to wipe out the distinction between the forms of action and between legal and equitable remedies, in order that all the rights of the parties in relation to the subject of legislation could be decided in one and the same forum and in a single action. This system has been adopted in most of the American States and is the basis of the reformed procedure established in England by the Judicature Act of 1873 (36 and 37 Vict., c. 66). The same commission framed a code of criminal procedure, which has also been adopted in most of the States. In 1837 Mr. Field was placed at the head of a new commission to prepare a political code, a penal code, and a civil code, which were finished and reported in 1875, but which, owing to the bitter opposition of the bar of the State, and especially of New York City, has never been adopted by the State of New York, though the civil and penal codes were passed by the two Houses, almost unanimously, in 1879, and failed only for want of the Governor's signature to become the law of the State. They have been of great service, however, in the legislation of many of the States, especially in California and Dakota, where they were adopted with a few alterations that were necessary in order to adapt them to local conditions.

Mr. Field's interest in reform was not confined to the civil or municipal law, but embraced the field of international relations. In 1866 the British Association for the Promotion of Social Science held a meeting at Manchester, at which Mr. Field made a proposal for a general revision and reform of the law of nations, similar to that aimed at in his labors for the reform of the civil and criminal law. Acting on his proposal, he completed in 1873 a work entitled *Outlines of an International Code*, which he presented to the social science congress of that year, and which met with very favorable criticism from eminent jurists all over the world. In 1873 he was elected first president of an association for the reform and codification of the law of nations, formed at Brussels in that year.

Mr. Field was a lifelong Democrat in his political convictions, but belonged to the Free-Soil and antislavery wing of that party before the Civil War and during the war was a staunch supporter of the administration of Lincoln. The

only party office ever held by him was that of Congressman, which he occupied by appointment for a short time in 1876 to fill a vacancy. Though distinguished in many ways, his fame rests chiefly on his achievements as a law reformer, in which field of high and disinterested service he occupies a foremost place. Many of his principal papers on law reform are included in his *Speeches, Arguments, and Miscellaneous Papers* (New York, 1884-90).

FIELD, EUGENE (1850-95). An American poet and journalist, born in St. Louis, Mo. During several years of his childhood he lived in Massachusetts and Vermont, and, though he completed his collegiate education in Missouri, he showed in his work traces of New England and Western elements which coexisted rather than blended in his nature. At 23 he began newspaper work, and 10 years afterward he became associated with the *Chicago Daily News*, with which he was for 12 years identified through his column "Sharps and Flats." Far the largest part of his literary production first appeared here. It is of varied manner and quality, prose and verse, detached paragraphs and continued narratives, by turns quaint, grotesque, delicate, Rabelaisian, farcical, and pathetic. He seemed to have equal sympathy with the wild life of the prairie and with classic culture, for irresponsible Bohemian life and quiet domestic felicities. He is probably most widely known as a poet of childhood, but most admired as a humorist. His first publication, *The Dancer Tribune Primer* (1882; reprinted in 1901 as *The Tribune Primer*), is one of the cherished rarities of the book collector. *A Little Book of Western Verse* (1889) and *A Little Book of Profitable Tales* (1889) are characteristic of his best original literary achievement. *Echoes from the Sabine Farm* (1893), in which he collaborated with his brother, R. M. Field, shows how fully he had absorbed the spirit of Horace. *The Love Affairs of a Bibliomaniac* contains his most delicately humorous essays; *With Trumpet and Drum* (1892) and *Poems of Childhood* (1904) well represent him as a children's poet. Several of his poems have been set to music, some of which may be found in *Musical Poems for School, Kindergarten, and Home*; music by Caro S. Seymour (1906). Consult Thompson, *Eugene Field: A Study in Heredity and Contradictions* (2 vols., New York, 1901).

FIELD, FREDERICK (1801-85). An English clergyman, born in London. He graduated at Trinity College, Cambridge, in 1823, became fellow of Trinity (1824), and was rector of Reepham, Norfolk, from 1842 to 1863. His scholarship was a rare combination of Greek and Semitic. He edited the Greek text of St. Chrysostom's *Homilies on Saint Matthew* (1839); St. Chrysostom's *Interpretation of the Pauline Epistles* (7 vols., in *Bibliotheca Patrum*, 1845-62); the Septuagint version of the Old Testament, according to the Alexandrian codex (subsequently revised and rearranged for the Foreign Translation Committee of the Society for Promoting Christian Knowledge); and Origen's *Hexapla* (2 vols., 1867-75). In 1870 he became a member of the Old Testament revision company. Consult the brief autobiography in his preface to Origen.

FIELD, GEORGE WILTON (1863-). An American biologist, born at North Bridgewater, Mass. In 1887 he graduated from Brown University (A.M., 1890), where he was later as-

sociate professor of cellular biology (1893-96), having in the meantime studied also at Johns Hopkins University (Ph.D., 1892), at the Naples Zoological Station, and in Munich. He was biologist of the Rhode Island Agricultural Experiment Station from 1896 to 1901, instructor in economic biology at Massachusetts Institute of Technology (1902), and in 1903 became biologist, and in 1904 chairman, of the Massachusetts Commission on Fisheries and Game. He became a director of the Massachusetts Audubon Society and in 1911 was president of the National Shellfish Association. His publications consist of reports and papers on original biological investigations and also *Lobsters and the Lobster Problem* (1910).

FIELD, HENRY MARTYN (1822-1907). An American clergyman, editor, and author, born at Stockbridge, Mass., a son of Rev. David Dudley Field and brother of the jurist of that name, as well as of Justice Stephen J. Field and Cyrus W. Field. He graduated at Williams (1838), studied theology, and from 1842 to 1847 was pastor of a church in St. Louis. Then, after three years of European travel, he became pastor of a church in West Springfield, Mass. (1851-54). After this he took up his residence in New York as editor and later, till 1890, as sole proprietor of the *Franglist*, an influential Presbyterian paper, visiting Europe frequently, and making a tour of the world in 1877. His numerous volumes are chiefly stories of travel. Of these *From the Lakes of Killarney to the Golden Horn* (1876), *On the Desert* (1883), and *Old Spain and New Spain* (1888) are typical. He also wrote a life of his brother, David Dudley Field (1898), and *Story of the Atlantic Telegraph* (1878; 1903).

FIELD, JOHN (1782-1837). An English composer, born in Dublin. He was the immediate precursor and probable model of Chopin and the modern school of pianoforte composition. Field came of musical stock. His father was a violinist, and his grandfather, of whom he took his first lessons, an organist. Subsequently, when the family removed to London, he was apprenticed to Clementi, who then had a pianoforte business, and who, recognizing the youth's remarkable gifts, taught him and employed him to show off pianofortes to customers. With Clementi he went in 1802 on an extended concert tour, visiting Paris, Germany, and Russia, where his pianoforte playing was greatly admired. On a second visit to St. Petersburg in 1804 he remained there as a much admired teacher and virtuoso. He did not return to London until 1832, appearing there most successfully in concert. A subsequent tour in Italy proved a failure. Under the effects of disappointment and dissipation he broke down at Naples, where, nine months later, he was taken out of the hospital by a Russian family with whom he returned to Moscow. But he never recovered his health, and died in Moscow. Field's works that have survived are his *Nocturnes*. They were the first successful efforts at composition unrestrained by classical form and offering the composer freedom of poetic fancy. In their name, their romantic and subjective treatment, as well as in their technical aspect, they clearly indicate the starting point of Chopin and of the modern romantic school. His works include 7 concertos (No. 4 of which was the most popular), 4 sonatas, 2 airs en rondeau, 4 romances, 18 nocturnes, and numerous other pieces

of kindred type. An essay on Field by Liszt and reminiscences of him in Spohr's autobiography will be found interesting. Consult H. Dessauer, *John Field, sein Leben und seine Werke* (Langensalza, 1912).

FIELD, JOSEPH M. (1810-56). An American actor and dramatist. He was born in London, came to America when very young, and for several years traveled through the country writing plays and acting them without attaining much reputation. In 1852 he assumed the management of a theatre in St. Louis, Mo., where he was also later principal owner and an editor of the *Reveille*, a daily newspaper. At the same time he became widely known for his humorous sketches signed "Straws" in the New Orleans *Picayune*.

FIELD, KATE (c.1840-96). An American journalist, lecturer, and actress, of eccentric talent. She was born in St. Louis, Mo., the daughter of Joseph M. Field (q.v.), was educated in New England and in England, and prolonged her stay in Europe as correspondent of various American newspapers, writing also for magazines. On her return she gave lectures and public readings and in 1874 appeared as Peg Woffington at Booth's Theatre, New York. She afterward abandoned the regular comedy for dance, song, and recitation, but achieved no striking success. In 1882-83 she headed a Coöperative Dress Association in New York, which achieved a conspicuous failure. In 1889 she established *Kate Field's Washington*, a weekly journal published in the capital. After 1868 she published numerous volumes of miscellaneous contents, no longer noteworthy.

FIELD, MAGNETIC. See **MAGNETISM**; **DYNA-MO-ELECTRIC MACHINERY**.

FIELD, MARSHALL (1835-1906). An American merchant, born in Conway, Mass. In 1856-60 he was clerk in Chicago in a wholesale dry-goods establishment, in which he was a junior partner from 1860 to 1865. In 1865 he became a member of the firm of Field, Palmer, and Leiter, which, in 1881, became Marshall Field and Company. Under his direction the firm obtained the largest wholesale and retail dry-goods business in the world, with headquarters in Chicago and branches in France, Germany, and England. He gave to the University of Chicago land valued at \$200,000, with a gift of \$1,000,000 founded in Chicago the Field Columbian Museum as a permanent repository for many exhibits of the World's Columbian Exposition of 1893, and bequeathed \$8,000,000 for the endowment and maintenance of the museum upon the expressed condition that within six years after his death there should be provided, without cost to it, a suitable site.

FIELD, MICHAEL. The pseudonym of two English women collaborators, the Misses Katherine Bradley (d. 1914) and Edith Emma Cooper (d. 1913), who wrote several poetic dramas and many lyrics. Among the most popular of their publications were: *Callirrhoe and Fair Rosamond* (1884); *The Father's Tragedy* (1885); *Camote the Great* (1887); *The Tragic Mary* (1890); *Long Ago* (1889); *Sight and Song* (1892); *Under the Bough* (new ed., 1893); *Attila, my Attila!* (1895); *Anna Ruina* (1899); *The Race of Leaves* (1901).

FIELD, RICHARD (1561-1616). A Church of England divine. He was born at Hemel Hempstead, Hertfordshire, Oct. 15, 1561, and graduated B.A. at Oxford in 1581. After a brilliant

university career as instructor and scholar, he became in 1594 rector of Burghclere, Hampshire, and there and at Windsor, where he was a prebendary after 1604, he chiefly resided thenceforth. In 1610 he was made dean of Gloucester. He attended the famous Hampton Court Conference in 1603 and enjoyed the special favor of King James. His fame rests upon his great work, *Of the Church* (London, 1606; modern ed., 1853), one of "the grandest monuments of polemical divinity in the language." His son prepared a *Life*, which was edited by Le Neve in 1716.

FIELD, STEPHEN DUDLEY (1846-1913). An American inventor, born at Stockbridge, Mass. Besides many minor patents, his inventions include a multiple-call distance-telegraph box (1874), an electric elevator (1878), a dynamo quadruplex telegraph (1880), and a fast stock ticker (1884). Field was the first to apply dynamo machines to telegraphy (1879) and also the first to use the quadruplex telegraph on an ocean cable (1909).

FIELD, STEPHEN JOHNSON (1816-99). A distinguished American judge, born in Haddam, Conn., in 1816. He was the second son of the Rev. David Dudley Field (q.v.). At the age of 13 young Field made a voyage to the East in company with a brother-in-law, who was a missionary, and he spent three years in Smyrna and Athens. Returning to this country, he graduated at Williams College, in 1837, with the highest honors. He then studied law in the office of his brother in New York City and, after his admission to the bar, became his brother's partner and devoted himself energetically to the practice of law until 1848, when he went abroad and passed a year in Europe. On his return, in 1849, he joined the tide then setting towards California and established himself there, at a place where now stands the city of Marysville. He was elected the first alcalde of the place, holding the office until the organization of the judiciary under the constitution of the State. Under Mexican law an alcalde had a very limited jurisdiction, but after the American occupation the jurisdiction exercised by him in the anomalous condition of society in California at that time was practically unlimited. In 1850 he was elected to the Legislature and was placed on the Judiciary Committee. He drew up a bill defining the powers of the courts of justice and judicial officers of the State, which was passed, and most of its provisions are still retained in the California code. He also secured the passage of a law giving effect to the usages and regulations adopted by the miners for the protection and working of the mines. The principles embodied in this law were adopted in other mining regions of the country, and finally by act of Congress became the mining law of the United States territories. In 1857 he was elected Judge of the Supreme Court of California, and in 1859 he succeeded David S. Terry as Chief Justice. When Mr. Field came to the bench, the titles to lands in the State were unsettled, and it was largely through the decisions in which he delivered the opinions of the court that the law of real property in California was placed on a permanent basis. In 1863 he was appointed by President Lincoln an Associate Justice of the Supreme Court of the United States, a position which he held with increasing distinction until his retirement by reason of age in 1897. Here he played a conspicuous and important rôle, expressing himself

with great force and freedom on all the great constitutional questions which came before the court for consideration during his long term of service, and being intrusted by the court with the duty of preparing many of its most important opinions. His opinions in the celebrated test-oath cases, in which the Supreme Court declared the invalidity of the "ironclad oath" imposed by act of Congress on all persons holding office under the government of the United States, and his dissenting opinions in the legal-tender, slaughterhouse, and income-tax cases were distinct contributions to American constitutional law and have become justly celebrated. In 1869 he was appointed professor of law in the University of California; in 1873, as one of a commission to examine and revise the codes of the State, he prepared important amendments which were adopted by the Legislature. He was a member of the famous electoral commission of 1877 which decided the presidency in favor of Rutherford B. Hayes, and he voted with the minority in favor of Samuel J. Tilden. As a judge, Field was noted for his independence of judgment and the strength of his convictions, as well as for the sanity and reasonableness of his views. He was a learned lawyer, but it was the breadth of his information and the range of his experience as well as the vigor of his mind which contributed most to his judicial equipment. His service on the bench of the Supreme Court, 34 years, the longest in the history of that tribunal, was also one of the most useful in its history.

FIELD ARTILLERY. The artillery which accompanies an army in the field. It may be classified as follows: (1) *Light Field Artillery* (guns of about 3-inch calibre; howitzers, 3.8 to 4.7-inch); (2) *Heavy Field Artillery* (guns, 4.7-inch; howitzers, 6-inch); (3) *Special Purpose Artillery*: (a) *Mountain or Pack Artillery* (calibre about 3-inch); (b) *Horse Artillery* (calibre about 3-inch). Calibres above 6-inch, used in siege operations, are classified as *Siege Artillery* guns, howitzers, or mortars. The development of field artillery and the field gun will be found in the historical sketch under **ARTILLERY** (q.v.), while under **HORSE ARTILLERY**, **HOWITZER**, **LIGHT ARTILLERY**, **MOUNTAIN OR PACK ARTILLERY**, and **SEIGE ARTILLERY**, these special branches will be considered. The present description is concerned with the modern field gun which is, indeed, a development of but a few years, but which played a most important part in the great European war of 1914.

The present quick-firing field gun, which permits the gun layer to maintain his position and sight on the target during the entire process of loading and firing, is the natural consequence of the introduction of smokeless powder. With the old ordnance the target was obscured by the smoke of discharge, and until this blew away the gun could not be re-laid. With the advent of smokeless powder, however, it was possible to keep the target in view, and some mechanical means by which the process of gun laying might be made continuous became a matter of concern. The solution was found in the hydraulic buffer or brake, and the stored energy by which the gun is returned to its firing position. This system was first utilized by the builders of naval ordnance, who introduced guns on this principle as a means of defense against the attack of small craft. (See **GUNS**, **NAVAL**.) It was not long, however, before the possibilities of this weapon

were recognized by army artillerists, for we find General Wille, in his *Field Gun of the Future* (Berlin, 1891), and General Langlois, in his great work *Field Artillery in Connection with the Other Arms* (Paris, 1892), advocating a gun and principles which have since been largely realized in the field gun as we now know it.

The first practical application of the principles laid down by these writers was made in the new *matériel* of the French artillery, which made its appearance in 1898. This *matériel* and the methods prescribed for its use were so immeasurably ahead of anything else then in existence that they may be said to have revolutionized the subject of field artillery. All other nations were compelled to rearm with a somewhat similar equipment, and to copy, to a greater or less extent, the new tactics of the French. It was not, however, without opposition, especially in Germany and England, that these methods were incorporated into the training of their armies, and as late as 1914 Germany prohibited the use of the covered position in many situations where it would have been employed unhesitatingly by the French or American artillerist.

Description of Light Field Gun. The modern light field gun, to which falls the bulk of mobile artillery work, is approximately 3 inches calibre (3.3 inches in England); about 30 calibres long, i.e., 30 times the diameter of the bore, and weighs, with its carriage (unlimbered), from 2000 to 2500 pounds; when limbered (limber filled with ammunition), the weight varies from 3000 to 4500 pounds. The latter figure is the weight of the British 18-pounder, which fires the heaviest projectile of all modern light artillery guns. The gun proper ordinarily consists of a steel tube, over which is shrunk a jacket with the necessary locking hoop, and recoil lugs or claps by which the gun is secured to the cradle. The jacket usually contains the recess for the breech block. This may be of the wedge type, in which the block slides transversely across the breech end of the gun, or the interrupted or stepped screw system, in which the block swings about a hinge pin and is locked to the gun by means of screw threads on both block and breech recess which are engaged by the rotation of the block. The former type is used by Krupp, while the latter system has been adopted by practically all other makers.

Material. Steel is now the only metal used in gun construction. Bronze was formerly much in favor, but Austria, the last nation to employ this substance, decided in 1912 to change to steel for all future manufactures.

Carriage. The carriage of the modern field gun is made almost entirely of steel and consists of the lower or traveling carriage (axle, trail, and wheels), the rocker, and the cradle. The rocker is simply a frame upon which the cradle is supported, and by means of which it is elevated or moved in direction so as to bring the gun upon the target. The cradle serves as a bed for the gun and as a housing for the recoil mechanism.

Recoil. Modern artillery differs from that of former years in the important particular that while the gun recoils the traveling carriage remains fixed, so that the piece does not require repointing after each shot, and the cannoneer need not step aside, as was formerly required. This is accomplished by introducing a hydraulic buffer or brake, which absorbs the energy of recoil by means of the passage of the liquid through small ports or openings in the piston.

At the end of recoil the gun is returned to its firing position by compressed air or by springs which have been compressed during the recoil. The former method, originally the secret of the French artillery, has been used in the guns manufactured by Schneider and Company for the Spanish, Servian, and Bulgarian artillery, and gave excellent service in both north Africa and the Balkans. The spring column is used in the product of Krupp, and in the American, English, German, and many other guns. The objection to this system is the tendency of the springs to lose their resiliency, and, moreover, they sometimes break. No trouble with the compressed-air system is known, and it is generally more favorably regarded by artillerymen.

Ammunition. The ammunition carried by modern field artillery consists of shrapnel, shell, and a composite projectile combining the properties of these two and variously described as combined shrapnel, high-explosive shrapnel, and universal shell. Great Britain, alone of the first-class powers, so late as 1914 carried nothing but common shrapnel with her light field guns, but, judging from comments in British prints, she, too, was likely to equip her field artillery with either shell or combined shrapnel. See AMMUNITION; SHRAPNEL; SHELL; PROJECTILES.

Propelling Charge. The propelling charge for the light field gun consists of approximately $1\frac{1}{2}$ pounds of smokeless nitrocellulose powder. See EXPLOSIVES.

Ranging. Two general methods are used to determine the range to the hostile target. The first, the one in which artillerymen have placed their greatest faith, consists of a process of ranging, or, more properly speaking, adjusting, since the length of fuse to explode the shrapnel or shell, and, in the case of indirect aiming, the deflection angles, must be determined as well as the range to the target. In this system the target is bracketed between two groups of shots, one of which is surely short of the target and the other surely beyond. The bracket thus obtained (usually 400 yards or meters) is reduced by halving until in most cases a 100-yard bracket is obtained. In the case of percussion fire the bracket is reduced to 50, or even 25 yards at the shorter ranges. During the ranging series the deflection angle and corrector are changed until the group of shots is brought to burst in air close to the ground and directly in line with their proper part of the target, so that the latter will be hidden by or silhouetted against the smoke produced by the bursting of the shrapnel. Thus, according to the United States regulations, a battery would open fire against a hostile battery, using the indirect method (sights directed on an auxiliary mark or aiming point) with a deflection of say 2000 mils,* a deflection difference of -10, corrector 25, and range 3000 yards. The shots of the salvo are observed to burst on percussion somewhat to the right of the target, which is measured (either by a graduated ruler, field glass, or telescope) and found to be 50 mils to the right. The four shots are also observed to burst on a front less than that of the target. The second

salvo would be fired with an increase of 50 in the deflection to bring the shots to the left, an increase of say 3 in the deflection difference in order to increase the width of the sheaf, and an increase of 5 in the corrector so as to get the burst into the air. Inasmuch as the first salvo burst considerably to the right of the target, it is not likely that the battery commander could have observed whether the range was "short" or "over," and he would probably repeat the range. Assume three of this second salvo to have burst in air and one on percussion, all short of and well distributed over the front of the target; for the next salvo the range would be increased 400 yards, the deflection, deflection difference, and corrector remaining unchanged. Suppose this to be over, and we have the 400-yard or long bracket; the next salvo would be fired with a range 200 yards less, which, if over, would cause a further reduction of 100 yards, which we will assume to be short, thus inclosing the target between 3100 and 3200. The corrector would be raised enough to give a burst 3 mils high (at which the maximum effect is obtained), and fire for effect is started with such speed and under such methods as the tactical situation and the ammunition supply suggest.

For infantry in the open a 200-yard bracket would probably be the smallest that could be obtained, in which case fire for effect would be delivered at different ranges within this bracket. For cavalry, a larger bracket, 400 or 500 yards, would be appropriate.

Registering the Terrain. Another method, countenanced largely by the French, consists of firing a number of shots with different deflections and elevations, and, by noting and recording where they strike, a battery is prepared to turn loose a sudden fire for effect without the loss of time necessary for ranging. This is particularly appropriate in the case of rapidly moving targets which are likely to disappear from view before the process of ranging can be completed.

Fire for Effect. Modern formations and tendencies towards concealment have given rise to the rafale or squall system of artillery fire, made possible by the rapid-fire gun and smokeless powder, in which each gun fires one or more rounds, as may be indicated in the commands. The French also use what they term progressive fire, in which each piece in the battery fires two rounds at each of four ranges, varying by 100 meters, all of which is executed at a single command, and the 32 shots are discharged in less than one minute. In progressive-fire sweeping three shots are fired at each range, thus covering an area of approximately 100,000 square meters with 48 shrapnel containing 13,916 balls, in less than $1\frac{1}{2}$ minutes. Progressive fire consumes great quantities of ammunition, and the French regulations have limited its use to the case of important fleeting target. This method, once taught in the United States artillery, has been abandoned in the regulations of 1911.

Another method is to subject the hostile target to a continued rain of projectiles at a uniform interval of discharge. This practice is not much favored, for the reason that the enemy soon learns to time the shots and can seek shelter accordingly, as was actually done by the Japanese during the Manchurian War.

These methods apply to shrapnel fire. As has been stated, the ammunition supply of field

* Artillery angles are usually measured in mils (a contraction of *millimes*, meaning thousandths). Thus, the chord subtending an angle of 1 mil is approximately $\frac{1}{1000}$ of the radius, or range. In order to make this ratio exact it would be necessary to divide the circle into 6283 divisions ($2\pi \times 1000$). This number is not convenient for division, so 6400, which obviates this objection and gives a ratio approximating $\frac{1}{1000}$, has been arbitrarily adopted.

FIELD ARTILLERY

UNITED STATES FIELD ARTILLERY AT PRACTICE

1. BATTERY IN ACTION. The battery commander on ladder is conducting fire against a target screened from the gun-layers by the trees in front.
2. FIELD BATTERY AT DRILL

FIELD ARTILLERY

EUROPEAN FIELD GUNS

1. KRUPP HEAVY FIELD HOWITZER UNDER TEST IN SOFT GROUND. Note the system of increasing the area of tread of tire on rear wheels.
2. KRUPP 7.5 CENTIMETER (2 95 INCH) 30-CALIBRE GUN IN TRAVELING POSITION.
3. THE SAME GUN IN FIRING POSITION. This is a general type in use in all armies.

artillery also includes explosive shell, and this projectile is used to drive troops out of stone buildings, from behind walls, from woods, and, for what artillerists believe to be its principal use, the destruction of hostile artillery *matériel*. The percussion fuse is employed, and the bracketing system is continued and narrowed until, long and short ranges being eliminated, direct hits may be expected. However, in this connection due allowance must be made for the accumulated error of gun, gunner, and ammunition, for, even with a perfectly adjusted firing, only about one shot in six can be expected to hit an exposed gun and caisson 3000 yards away. These are peace figures. War conditions would make the percentage of hits considerably smaller.

Positions. The most revolutionary and far-reaching development in the use of field artillery, introduced by the French in 1898, consists in the employment of guns from concealed or covered positions, usually behind a hill crest or even an intervening wood or a field of high grain. As the gun layers cannot see the target, they direct their sights on an auxiliary aiming point, making the necessary correction for the angle between the aiming point and the target. Telescopes with goniometric attachments form part of the battery equipment and are set up at a point in the vicinity of the guns from which the target can be seen. From that point the battery commander, by means of the numerical data in his commands, shifts the planes of fire of all the guns in his battery until they are brought to bear on the desired part of the target. When time is pressing, these angles can be measured with a small ruler held at arm's length or even with the width of the hands and fingers, which are duly calibrated. In order to follow this system it is necessary that all guns be provided with some kind of goniometer. That most in use is the panoramic sight, the object glass of which turns 360° about a vertical axis while the eyepiece remains stationary. By this means any point in the landscape is brought into view, and if the angle between the selected aiming point and the target be known, it is a simple matter to point the guns at the target by directing the sights upon the selected aiming point.

A considerable zone in front of the covering crest or mask lies beneath the path of the projectile that clears this mask. For this reason indirect fire is impracticable for the defense in the latter stages of the hostile advance, and then the guns must be brought up to the crest and fought according to the old direct methods in which the gunners actually see and aim at their separate targets.

Although the accounts of the Manchurian War seem to have clearly established the fact that exposed artillery stands little or no chance against concealed guns, a principle emphatically confirmed in the accounts of the Balkan War, yet there has been considerable opposition to the use of the concealed position. It is forbidden to the German infantry batteries. The Germans seem to prefer the semicovered position, in which the sight, raised above the gun by means of an extension rod, can just see over the crest. In order to make the flash invisible, the guns must be heated 12 feet below the covering crest, and this has come to be the position most preferred by the French, at least in the early stages of the action.

Manœuvres. The manœuvres of artillery

are confined to the evolutions necessary to get the guns into position. While marching on the road the carriages follow in a single column, and naturally move at the gait of the infantry with which they march. Preparatory to the occupation of a position the caissons, attached to the gun sections, ordinarily move alongside of their pieces, and the two carriages are manœuvred as a single element. During action the caisson remains alongside of the piece, and its shields serve as a protection to the cannoneers engaged in the process of serving ammunition. When moving to occupy position, its usual gait is the trot of 8 or 9 miles an hour. It is only in emergencies that the gallop is now used. Thus, when crossing a fire-swept area, the carriages would probably move singly at the greatest speed to which the horses could be urged. In approaching their chosen positions batteries utilize folds in the ground so as to conceal their approach. Artillery officers and scouts precede their batteries, which are carefully conducted to concealed positions by guides who have previously gone over the ground.

Tactics. Inasmuch as artillery has no independent rôle, its sole raison d'être is to assist the infantry. This it does by its fire action, although the moral support and encouragement arising from the mere action of the guns is not to be despised. It is a well-accepted principle of modern tactics that success is to be obtained only through offensive action. Even when taking up a defensive position, the question of counter attack is kept in mind. Now, offensive tactics imply an intention to advance and close with the enemy, and, if we except night attacks and bush warfare, this can only be accomplished after fire superiority has been gained. Both infantry rifles and the field guns are used to obtain this superiority, which, when won, permits a portion of the infantry line to cease firing and advance—two tasks it cannot do at the same instant. It is here that the artillery plays its part; for, by subjecting the hostile line to a well-directed shower of shrapnel, it will keep down the enemy's rifle fire and thereby relieve and assist its own infantry. But the hostile artillery also must be reckoned with. If left to its own devices, it will subject the attacking infantry to such a fire as the latter's guns are pouring into the defender's lines.

Assuming that the two artilleries are both ample and equally skillful, there is no relative gain to the infantry of either side. For this reason hostile artillery, especially when firing upon friendly infantry, must be engaged and, if possible, destroyed. This gives rise to the artillery duel, although in the modern practice of separating battalions and batteries, rather than establishing the guns in one line as was the custom during the last century, this will likely take the form of a number of separate although more or less coordinated artillery combats in which the success may vary at different parts of the line.

It is no longer practicable for the infantry to await the outcome of this artillery duel before starting its attack. Indeed, in many cases, especially on the part of the defense, the guns will remain silent—will not disclose themselves—until the infantry advances in force. Nor will there be much more reason for the premature opening of the attacker's guns, for it is doubtful if, prior to the advance of the attacking infantry, the defender's troops will have

disclosed themselves sufficiently to justify the expenditure of ammunition. All agree, however, that the point selected for the assault must be subjected to the heaviest possible artillery fire while the infantry advances to the attack.

It is now considered both normal and necessary for the artillery to fire over the heads of its own advancing infantry, continuing this fire until the last possible moment. If stopped too soon, the defender's infantry, freed from the

open to discussion, depending as it does much upon accuracy of armament and skill in the service of the gun. Both the French and German regulations mention 300 meters from the enemy as the probable limit. Bethell, an eminent English author, thinks that this is far too great, and that under favorable circumstances, as where the trenches are on a rising slope, fire can be kept up until the troops are within 50 yards. It must be borne in mind that the British gun, firing an 18-pound shrapnel, is re-

menace of shrapnel bullets which has caused them to hug the shelter of their trenches, or at least has materially reduced the effectiveness of their fire, will rise up and subject the oncoming infantry to the most deadly fire encountered during their advance. For this reason the Japanese infantry demanded that their artillery continue to fire beyond the limit of safety, preferring the smaller losses inflicted by their own guns to the deadly rifle fire which they knew would follow close upon the silence of the artillery.

At just what point of the infantry advance the artillery must cease its fire in order to avoid hitting its own attacking infantry line, is still

markedly accurate. According to the law of probabilities and the error of the gun and fuse, the German shrapnel, fired at a range of 2500 meters, may burst anywhere within a zone 210 yards wide. The United States gun, which occupies an intermediate position for accuracy, for the same range, will burst all shrapnel within a zone 153 yards wide, and 96 per cent of the total number within 115 yards. Both these figures should be increased to allow for the excitement of battle.

The various targets and situations arising on the battlefield give rise to a classification of batteries, according to the duties immediately required of them, into *counter batteries*, those

designated to engage hostile artillery, and *infantry batteries* (including accompanying batteries), whose objective is the hostile infantry. Another class, *decoy batteries*, should be mentioned. These purposely expose themselves with a view to drawing fire, thereby learning the location of hostile guns; but no example of this last class can be found in the accounts of either the Manchurian or the Balkan war. This classification, first used by the French, has been dropped from their regulations, although

aiming point is measured from the aeroplane at the moment it flies over the firing battery, and the result is communicated or signaled to the guns in some such way as by smoke flashes, messages dropped near the battery, or maybe by wireless telegraphy, in which latter method experiments have been made. The guns are then laid with different ranges, varying by 400 or 200 yards, say, 3000-3200, and fired at the instant the aeroplane crosses their line flying in the direction of the enemy, the flight

Germany:—126 rounds per gun, in addition to 103 rounds per gun with light ammunition column. Also 6 H.E. shells per gun are carried in the battery store wagon.

Holland:—The 6-gun administrative battery is fought as two 3-gun batteries.

Japan:—The figures given refer to the 1905 gun. This will be superseded by the 1907 Arisaka gun.

Norway:—The shield weighs only 56 lbs., and is carried on the wagon.

Russia:—The ammunition includes 45 rounds per gun in the store wagon limber.

Spain:—The proportion of ammunition to be carried has been fixed at 64% shrapnel, 16% common, and 20% high explosive.

the principle still exists with them, as it does to a greater or less extent with all other nations. These designations still appear in the drill regulations of the United States artillery.

The Conduct of Fire from Aeroplanes.
An important step in the development of artillery tactics has been the control of fire from aeroplanes. Several nations have made important developments along this line. In general, the practice is to direct the fire of concealed batteries against hostile artillery or other immobile troops so located and sheltered that they cannot be seen from the vicinity of the attacking guns. In this case the angle at the firing battery between the hidden target and some prominent

in that direction being continued long enough to note the point of burst or strike of the projectiles. The results are signaled back as both short, both over, or bracketing, the necessary deflection and fuse connections being noted also. The next salvo can be corrected in the proper sense by an appropriate amount, and the process continued until a bracketing salvo is secured. This can be reduced to the desired bracket (usually 100 for a battery in action), and the guns can pass to fire for effect. The methods are necessarily slow and dependent upon the weather and the perfectly coordinated action of all concerned. Nevertheless, if batteries in future lie quite concealed like beasts

waiting to spring unhindered upon advancing infantry lines, some method must be devised by which the attacking artillery can seek them out and cripple them before they in their hidden security play unmolested upon the advancing infantry. That this view is gaining ground is shown by the fact that German batteries in their manœuvres of 1913 took pains to conceal themselves from aviators by screening and covering the guns and *personnel* with boughs, and this was also the practice in the war of 1914.

A two-passenger machine is employed for the work, for it is beyond the power of one man both to pilot the machine and at the same time also communicate to the guns the results of the fire. It naturally follows that the observer should be an artilleryman, and it would seem that the battalion commander, because of his knowledge of the many technical and tactical considerations which will arise, as well as the fact that he is the commander of the tactical unit, the battalion, is the logical officer to be intrusted with this duty. The possibilities are great, and developments along these lines in the great war were watched with interest by artillerymen.

Several European manufacturers have produced a gun especially designed for the attack of air craft. One type (Krupp) is a 15-pounder with differential recoil and air recuperator mounted on portable platforms or motor cars. At 75° elevation it will send its projectile approximately 20,000 feet into the air. The use of the differential recoil so reduces the strains set up that a motor car can be used as the firing platform. Another and opposite type consists of a rapid-firing 6-pounder mounted on a swift motor car. This gun is designed to follow the air craft and by the swiftness of its movements and rapidity of its fire secure effect. The success of this type has been limited. A third and probably the most practicable type, at least the only one which has yet been incorporated into the armament of any nation, is a field gun with split trail which permits the breech to be depressed sufficiently to give the elevation necessary to attack air craft. The Italian (Deport) gun is of this type, and the United States in 1914 was engaged in the manufacture and test of gun carriages based upon this principle. This type fills the rôle of an ordinary field gun and in addition is suited for the attack on air craft.

Draft. Light field guns and howitzers are now drawn by six horses, as the experience of several centuries has demonstrated that three pairs of horses hitched in tandem mark the limit of economic artillery teaming. The width of roads and trails over which artillery must operate precludes hitching animals three abreast, as is done in commercial teaming; the pulling capacity of six horses determines the weight and, a priori, the power of the gun. Further experience has placed this capacity at 800 pounds per horse. So 4800 pounds must include the weight of the vehicle, implement, and members of the gun detachment. This limit is maintained in the case of the light guns and howitzers, but is not practicable in the case of the heavy guns and howitzers to which heavy horses are assigned. This latter type is not required to move with the speed of the light guns.

It would seem at first glance that the weight of ammunition carried in the limbers might be utilized in building a more powerful gun, but

this would place an excessive weight upon the gun wheels, which would sink farther into the ground and thereby greatly increase the work of draft.

The horse most favored for this work is a compactly built, muscular animal, about 15 hands, 3 inches high, weighing approximately 1200 pounds. He varies somewhat from the type formerly preferred when dashing movements were in vogue, and handy horses, necessarily smaller and lighter than those described above, met with the favor of the artilleryman. Now, when the artillery seldom moves faster than a trot, which it must be prepared to sustain for several miles, the heavier, more powerful horse that is not compelled to strain himself is preferred.

The harness in the United States is what is known as continuous draft; i.e., the traces are attached so as to make one direct pull from the lead horse to the singletree. The Germans and many other nations make use of the splinter-bar system, by which each pair is hitched to its own doubletree or splinter bar. The advantage of continuous draft is that it admits of quicker movement and closer turning. Its corresponding disadvantage is that it exerts a downward tendency on the necks of the wheel horses, making necessary considerable care on the part of the drivers to avoid sores.

The wheels are made as large as considerations of weight and stability in firing will allow, this in order to reduce the work of draft. On the continent of Europe the wheels are considerably smaller than in England and the United States, where the diameter has been fixed at 4' 8". The better roads of continental Europe admit of this saving in material and weight.

Organization and Command. Artillery is now organized into batteries and battalions and in most armies into regiments and brigades. The basic unit of artillery is the battery of four or six guns, ordinarily commanded by a captain and subdivided into platoons of two sections, each containing one gun and one caisson (or two caissons) each. In English writings platoons and sections are termed sections and subsections respectively. With the exception of England, Germany, Russia, Italy, and Turkey, all nations have settled upon four guns per battery, although the transition has not yet been effected in Austria and Japan. The Russian battery consists of eight guns, commanded by a lieutenant colonel, but it is often tactically divided into two half batteries of four guns each. A battery in the United States army at peace strength consists of 5 officers, 133 enlisted men, and 120 horses. The war strength is 5 officers, 171 enlisted men, and 157 horses.

The reduction of the number of guns in the battery (six was the universally accepted number before the advent of the hydraulic recoil brake) is based upon the fact that four guns can be handled and fought far more skillfully than six. This is particularly true in locating battery positions. The rapidity of fire which is characteristic of the modern weapon is such as to make a heavy demand upon the ammunition supply. With the 4-gun battery the men and horses and (what is also of considerable importance) the road space required for the two other guns are utilized in providing additional ammunition wagons. Thus, in the United

States service the 6 guns and 9 caissons which constituted the battery with the 3.2-inch gun, the immediate predecessor of the present weapon, have given place to 4 guns and 12 caissons, providing an ammunition supply of 358 rounds per gun, an increase of 127 rounds per gun.

Three batteries ordinarily constitute a battalion (British *brigade division*, French *group*, German *Abteilung*), under the command of a major, although the British brigade division is commanded by a lieutenant colonel. The regiment is composed of from two to four battalions and is commanded by a colonel. Two regiments constitute a brigade, the usual complement of a division in which there are from 12,000 to 16,000 infantry bayonets and which is the smallest complete army unit. In the British and Russian armies the artillery organization does not extend beyond the brigade division (battalion), and with the French it ends with the regiment.

For a useful bibliography of field artillery, including both modern works and historical treatises, consult article ARTILLERY. See ARMY ORGANIZATION; TACTICS, MILITARY; OBDRANCE; PROJECTILES; ETC.; also the paragraphs on Army in the articles on the various countries.

FIELD BUG. A pentatomid. See STINK BUG.

FIELD COOKING. The method of preparing soldiers' rations in the field. Field kitchens are of two general descriptions, each type including the many varieties necessary to meet successfully the many contingencies of campaign service. 1. Troops having good facility of transport carry with them apparatus more or less elaborate, with which, particularly in the case of the United States army, meals can be prepared little, if any, inferior to those prepared in permanent posts. 2. Under circumstances less favorable recourse is had to various forms of trench ovens and cooking. In most armies this forms a distinct branch of instruction and with the general advance of military science and hygiene is receiving more than ever before its proper share of attention. In the United States company commanders are responsible for the selection of cooks, the kitchen,

oven. There are two types: army field range, No. 1, weight 264 pounds, is designed to cook for 150 men; No. 2, weight 150 pounds, cooks for 55 men. Either may be carried on pack mules. Both are made of sheet iron. They are adapted for roasting, baking, frying, broil-

FIG. 2. WIRE TRENCH FOR FIELD COOKING, United States Army.

ing, or stewing, easy of transportation and capable of compact packing. Where these are not available, troops are trained in the construction and use of the many improvised trench ovens in general use throughout all civilized armies. In the United States army cooking fires are prepared as follows: When fuel is plentiful, a trench about 1 foot deep is dug to hold the fire. Green poles or irons, resting on uprights of suitable height, support the camp kettles. If fuel is scarce, the trench is made somewhat narrower than the diameter of the camp kettles; the latter then rest on the ground, and the intervening spaces are covered with stones or clay, forming a sort of flue. The draft may be increased by widening the opening towards the wind and by building a chimney of sod or stones at the leeward end. The trench should have a slight fall from the chimney for drainage. Four such trenches radiating from a common chimney afford good draft, whatever the direction of the wind. When bakeries or portable ovens are not available, suitable ovens are improvised. A simple expedient is to lay an empty barrel on its side in a depression, knock out one head, and plaster the barrel over with six to eight inches of clay, and then cover with an equal thickness of earth. A flue of clay is constructed at the closed end of the barrel, which is then burned out, leaving an oven of baked clay. Improvised incinerators, for the disposal of garbage, are constructed as follows: A pit is dug about 5 feet long, 2½ wide, 6 inches deep at one end and 12 at the other; the excavated earth is banked around the pit, and the latter is then filled with stones on which the fire is built. Liquid matter is evaporated on the hot stones; solid matter is burned in the fire. A good type of the trench cooker is the broad-arrow form of trench used by the British army. Two, three, or more trenches are constructed, each joining a common chimney at different angles, the mouths of which, spray-shaped, are about 18 inches in depth, the trench itself being graded from the mouth to about 4 inches at the chimney. Earth excavated from the trench is used in building the chimney and packing round the pans, which are placed bridgewise across the trench, confining the heat and securing good draft. The advantages of this system are its independence of transport, only a pick and shovel being required for constructive purposes; little or no skill required on the part of the troops; and,

FIG. 1. FIELD COOKING TRENCH, United States Army.

ens being under the direct charge of specially trained noncommissioned officers. The cooks and n.e.o. in charge are usually graduates of the SCHOOL FOR COOKS AND BAKERS (q.v.). On campaign troops are supplied by the quartermaster's department with the field range, a rectangular, boxlike adaptation of the Dutch

most important factor of all, a number of pans simultaneously served by one ordinary fire. The Army Service Corps of the British army kills and prepares the fresh beef, and bakes the bread used by the troops, regimental quarter-

British Army pattern.

masters receiving on requisition the rations which are prepared for consumption by the regimental cooks as above described.

The armies of continental Europe have methods similar to the United States, French troops being additionally equipped for marching purposes with a small coffee kettle, which, together with a bundle of dried brushwood, is carried by two men of each section or platoon. When fatigued and halted for any length of time, coffee is made by them for the men of their section. In most of the great armies cooking stoves and ovens, fireless cookers, and soup caldrons, carried on carts or in wagons, are operated while on the march, so that the hot food is ready for the men upon their arrival in camp. One of the best descriptive and comprehensive authorities on this subject is the *United States Manual for Army Cooks and Bakers*, published by the War Department (1910).

FIELD DOG. One of a distinct class of dogs which aid men in the capture of game birds afield; bird dogs. The group comprises pointers, setters, retrievers, and the Chesapeake Bay dog; also, incidentally, some spaniels (described under SPANIEL). The function of these dogs is to range the field in front of the hunter and to determine by scenting the presence of the birds sought. When a pointer has located a bird or birds, he will indicate or "point" it by stopping short with nose directed towards the spot where the game is, and he will not stir until the gunner comes up to him, when he will on order, if it be necessary, go yet nearer to the birds until they become so alarmed as to rise from their cover and expose themselves to the gun. If a setter is used, he will do the like, but, instead of maintaining an erect position, he will crouch or "set," as an indication of the bird's presence. The retriever is mainly sent into the cover after birds which have been shot but have fallen at a distance and are out of sight. He scents them out, gently picks them up, and brings them to his master.

The Setter. Three breeds of setters are recognized: 1. The English, which is white speckled dispersely with larger or smaller portions of black, each color standing out from the other well defined and distinct. The English setters are divisible into two main strains, the Laveracks and the Llewellyns. 2. The Gordon setter, which is a rich, glossy plum black, with deep sienna or dark mahogany-tan markings on lips, cheek, throat, and on feet and legs. 3. The Irish setter, which is uniformly colored a rich golden chestnut. The English setter has an authentic history as far back as 1555, when

Robert Dudley, Duke of Northumberland, is recorded as using the setter when netting birds. The date of the origin of the Irish is more doubtful, but Gervase Markham, writing his *Art of Fowling* in 1621 and dealing with the question of the setter's colors, does not mention it. The Gordon was produced in the kennels of the Duke of Gordon about the year 1820. The setters are handsome dogs, weighing from 48 to 60 pounds (the bitches 8 to 10 pounds lighter), with soft, silky hair on the body, fringing longer on the belly and behind the legs, and longer still (the "feather") on the under part of the tail, which tapers down, however, to a point. The hair may slightly wave, but never curl. In form they are exceedingly artistic and graceful and in temper obedient and gentle. The head of the setter is peculiar to itself—long and keen, with a good depth from the bridge of the nose to the lower part of the lip. The shoulders should not be so heavy as to interfere with their full and free action, yet the bones should be strong and the legs well muscled. Catlike feet, well covered with hair, are desirable. The tail, or "flag," is one of the most striking features. It should be carried straight out without the least inclination to turn up over the back.

The Pointer. There are many varieties of pointers—English, Spanish, Portuguese, Russian, French, and Dalmatian (see COACU DOG), varying only, however, in size from the heavy, huge Spaniard to the diminutive Frenchman. The English and American dogs are the typical pointers. Short-coated, rat-tailed, cat-footed, without an atom of hairy padding on them, strong-boned, tight-muscled, upright, bright, great goers, and keen-scented, they are models of all a field dog should be. Though not so large now as he was in earlier days, the modern pointer is of good size, weighing generally from 50 to 55 pounds. The points of a typical specimen of this breed should include a head moderately large, wide rather than long, with a high forehead and an intelligent eye; the muzzle should be square in front; the neck long and free from dewlap or ruff; the body should have a strong loin, wide hips, and a chest well let down: a tail strong at the root and growing finer to within two inches of the tip, when it decreases to a sharp point (an unfailing indication of true pointer blood). The shoulders should be long, slanting, and powerful, the legs strong, and the feet thick-soled; muscular haunches and thighs, well-bent stifles, and large, strong hocks. In color pointers vary very much. The most usual combinations are liver and white, yellow and white, and black and white. There are some whole-colored black ones, but a good admixture of white is preferable, so that the dog may be easily distinguished when he is ranging in cover.

The Retriever. This dog is most useful when the birds are aquatic or are such as haunt sloughs, from which he will gather in the killed or wounded with unerring nose. There are mainly two kinds, the English and the American, or Chesapeake Bay, dog. The English variety has been generated mainly by crossing two other breeds, such as the spaniel and Newfoundland, or the spaniel and poodle, one breed tough-skinned and stiffly coated, and both dogs of remarkable powers of scenting. The rest is a matter of training. There are two distinct strains of the English retriever, the curly-

coated black and the flat or wavy-coated. The latter has the appearance of a heavily made, somewhat clumsy setter, with more bone and substance than is required in a fast field dog. The former has the body covered with short curls, though the head is smooth. The curly variety may be either black or liver-colored. Each weighs from 55 to 68 pounds. As the function of this dog is to carry dead game, the jaws should be long and strong; and that his scenting powers may have full capacity the nose should be wide, the nostrils open, and its end moist and cool.

The Chesapeake Bay dog is the American retriever pure and simple. The origin is problematic, but he derives his name, like the Newfoundland, from the home where he first became famous. He is the finest retriever in the world. No sea is too boisterous, no water too cold, no bird too big, from a Canada goose to a swan, and no wounded bird, be he diving duck or crippled woodcock, can escape his nose and swimming skill. He is a large dog, weighing 65 pounds, with a thick, short, coarse, sedge-grass-colored coat about $1\frac{1}{2}$ inches in length, and with a tendency to wave over the shoulders, back, and loins, and underneath this a short woolly fur covering the whole skin. His legs are somewhat short, and he is provided with well-webbed feet.

Griffon. The Germans have a field dog which they consider superior to either the pointer or setter, inasmuch as he is capable of taking the place of both those breeds. It is called "griffon" and sometimes "basset griffon." It is a very robust dog, with a rough, hard coat that undoubtedly is a great protection to it in a district where the undergrowth is thick and low; stands rather higher than the setter, and in color is a grizzly liver. The griffon made its first show appearance in America at the Westminster Kennel Club's Show at New York in 1901. See Dog, and consult the authorities there mentioned; and Plate of HUNTING-DOGS.

Dog Breaking. The field dog is a hunter by nature, but before being required to exercise his faculties to scent and locate game and yet refrain from catching it, he must be specially trained. This training begins with yard breaking, in which the puppy is taught to remain quiet in confinement and to become accustomed to collar and chain. His subsequent field education will depend upon his breed. Spaniels, pointers, setters, and retrievers all have different functions to perform, viz., spaniels are expected to flush their game; pointers and setters not to do so, nor are they usually expected to retrieve it, as retrievers are employed for that purpose. The most important general principle is to establish the habits of obedience and confidence, after which the dog is taught to keep at the hunter's heel until, if he be a spaniel, pointer, or setter, he is sent forward. Then he must quarter or range over his field only within certain limits of the gunner, and on signal must not exceed this limit. The next step is to inculcate the knowledge that (except in the case of a spaniel) when he has located the birds he must not flush them. To teach him to "down" is a comparatively short process with the average well-bred dog, and keeping to heel is as easily learned. Most dogs will range when told; all they need is a direction as to where they should begin. The dog under training should be started always

against the wind, that he may catch the scent. The lessons to be impressed on him are to stop when signaled, to return, and to start again. When a puppy first flushes a covey of birds, he will usually proceed to chase them—a fault which is corrected by taking him back to the exact spot where he should have stopped and dropping him to hand; he will thus gradually learn to drop to wing. If a perfectly seasoned and steady dog is available when the puppy is being taught to back, it will be found to expedite the training greatly.

Field trials are competitions over definite areas, before competent judges, who follow the dogs and gunners over a game country and award prizes according to the points of merit established by each dog in the class for which it is especially fitted by nature and training. These trials include other dogs. The fox hound and the beagle as well are tried out after their respective quarries. Consult: Hutchinson, *Dog-Breaking* (London, 1865); H. H., *The Scientific Education of the Dog for the Gun* (ib., 1890); *Field-Dog Stud Book*, vols. i-v (New York, 1901-05); Hochwalt, *The Pointer and the Setter in America* (Cincinnati, 1911); Barton, *Sporting Dogs* (New York, 1910); id., *Gun Dogs* (London, 1913); Shaw, *Encyclopædia of the Kennel* (New York, 1913).

FIELD ENGINEER SCHOOL, UNITED STATES ARMY. See ENGINEERS, CORPS OF.

FIELDFARE (from AS. *feld*, field + *faran*, to go). A thrush (*Turdus pilaris*) of northern Europe, visiting Great Britain and the Mediterranean countries in winter and going in summer to breed in Scandinavia. The general color of the male is gray, the feathers tipped with a brownish-black elongated spot; the throat and breast reddish yellow, streaked and spotted with black; the fore part of the back and wings rich chestnut; the tail slightly forked and nearly black; the underparts white. It may generally be found in small flocks—in fields, if the weather is mild, feeding on worms, snails, etc., or in severe weather, about hedges, thickets, and woods, wherever haws and other such fruits or seeds are abundant. It is extremely plentiful in Norway in summer, where its nests are built in birches and firs, and, contrary to the ordinary habits of thrushes, in society, numerous nests being often found in the same tree. The fieldfare is easily tamed and sings well in captivity, the song being melodious but not brilliant.

FIELD GLASS. A small binocular telescope constructed so as to have considerable magnifying power and at the same time to be extremely portable. It is a Galileo's telescope with a large achromatic object glass to secure a brilliantly lighted image, and an achromatic eyeglass which is negative or concave. The magnifying power of the field glass is ascertained by dividing the focal length of the objective by that of the eyepiece; consequently the magnifying power of such a glass is limited by the length of tubes which can be used. To obviate long tubes field glasses are now constructed where, by an arrangement of reflecting prisms placed within the tubes, the ray traverses to and fro, and the advantages of a long focal length in small compass are obtained. Field glass is a term also applied to the lens interposed between the object glass and eyeglass of a microscope, which, receiving the diverging rays from the former before they form an image,

causes them to converge and thus contracts the dimensions of the image and increases its brightness, so as to render it of such a size and degree of distinctness that the whole of it may be viewed by means of the eyeglass. See MICROSCOPE.

FIELD GUN. See **FIELD ARTILLERY**; **ORDNANCE**.

FIELD'ING, ANTHONY VAN DYCK COPLEY, known as **COPLEY FIELDING** (1787-1855). A British water-color painter. He was born in Yorkshire and studied under his father, a portrait painter, and later under John Varley. He contributed very largely to the exhibitions of the Society of Painters in Water Colors, of which he was an influential member, and president from 1831 until his death. He is especially noted for his effects of light and mist and found an ardent admirer in Ruskin, who was his pupil. His best work is his landscapes of the Sussex Downs and storm scenes at sea, but his early drawings of Scottish, Welsh, and north English lake and mountain scenery were also very popular. As a teacher, he was much sought after. In later life his work declined, but he was, nevertheless, one of the most distinguished of English water-colorists. The South Kensington Museum contains 18 water colors and one oil painting by him.

FIELDING, HENRY (1707-54). An English novelist, not improperly called the father of the modern novel. The son of Gen. Edmund Fielding, he was born at Sharpham Park, near Glastonbury, in Somersetshire, April 22, 1707. He belonged to the younger branch of the earls of Denbigh, and his aristocratic spirit showed itself in many of the political controversies of later life. Life at Eton was followed, thanks to a youthful escapade, by two years' attendance at the University of Leyden, where he studied law. On returning to England it was necessary for Fielding to win his way for himself, as his father was richer in children than in more material treasure. He determined on play writing and for 10 years contributed generously to the stage, beginning with a few comedies of the Congreve school. Some 25 plays make up the total of this period, but none of them were striking examples of dramatic art. They did contain, however, sufficient political satire to give rise to the Lord Chamberlain's censorship of the drama. The interest of the dialogue in parts, and the humor which one so readily associates with Fielding, are not lacking in them, while the plots of many show that he had the story-teller's gift; but on account of a desire to adapt his plays to the taste of the times, and an inability to comprehend as well as to rise to the heights of dramatic possibility, his dramatic work is forgotten. *Love in Several Masques* has an historical interest, as it was the first to be produced (1728), and so introduced Fielding to the public; while *Don Quixote in England* is worth at least a mention, as it suggests his liking for Cervantes. To Cervantes Fielding looked back as afterward Thackeray looked back to Fielding, and as we read *Don Quixote*, *Joseph Andrews*, and, say, *Henry Esmond*, we note how the warm, genial, honest blood runs truly and similarly through the veins of these authors. All three have insight into men's characters, and power to see beneath the surface of life alike high and low; all three have the saving grace of humor, the sincere hatred of hypocrisy, the pleasant fac-

ulty of personal interpolation and friendly interpretation of men and things. The two Englishmen, indeed, lacked the genius for noble idealization which Cervantes possessed; but all three were optimists in a world whose evil they plainly discerned and described, and the winningness of their work is not lessened by that splendid power of satire which in Thackeray and Fielding was directed against the affectations and hypocrisy of their own times and society, exposing the ridiculous in life, while in Cervantes it dealt more nearly with what pessimists look upon as the satire of the universe, the seeming futility of ideal endeavor.

Fielding's reputation rests most firmly on four novels: *Joseph Andrews* (1742); *Jonathan Wild* (1743); *Tom Jones* (1749); and *Amelia* (1751). *Joseph Andrews* was planned to be a parody on Richardson's *Pamela*, the sentimental, moralizing novel in which the poor heroine is rewarded for her virtuous resistance to the nobleman, her lover, by the offer of marriage, which Fielding suggests may have been one of the motives of her chastity. Joseph Andrews, the handsome, pure-minded footman, was, as brother of Pamela, to parallel his sister's virtuous conduct; but before the story had progressed far the author became so interested in the characters he had set in motion that the parody purpose was set aside, and the novel developed as an original and independent work of fiction. Parson Adams, the stalwart, confiding, simple-minded, and high-minded curate, is one of the most engaging persons that eighteenth-century literature has bequeathed to us, while the description of the inns and of the life of the road, again reminiscent of Cervantes, are vivid to the point of reality. The faculty of description was Fielding's, and if often we miss the intense emotional treatment or the sympathetic delineation of the spiritual element in man's activity, it is still good to listen to the exposition and to the comments of one whose common sense allowed no dimming of his perception, and whose manly nature and warm heart would not permit poverty, the animosity of enemies, or sickness to warp his judgment. His writings are, therefore, graphic and illuminating, and though they are not loftily inspiring because of their lack of certain finer sympathies, a pervading healthiness of tone and a sense that we are receiving a full and frank report upon human nature as the author saw it, are a sufficient apology for the broad speech that so often rings unpleasantly in the sensitive modern ear. His own experience crops up unmistakably in his books, and Tom Jones has well been called "Fielding in his Youth," as Captain Booth is "the Fielding of later years." The looseness of many of the scenes and the coarseness of much of the language of his novels are indicative, therefore, not alone of a lax society, but also of a life in which there was a good share of rioting and carousal. The final words of praise to be said of Fielding's novels are that they possess the unity of plot which differentiates them from such structureless work as that of Smollett, while the remarks and criticisms embedded in them have much of the wisdom and the wit that one looks for and finds in Montaigne. It is the lack of opportunity in dramatic compositions for such personal running commentary and maxims that partially explains the comparative failure of Fielding as a playwright.

Fielding married in 1737. It did not take him long to use up his wife's fortune in extravagant living as a country squire, and so in 1740 the law was taken up as a means of livelihood. No success followed his legal studies, and the author went back to his pen and paper. *Jonathan Wild* (published in his *Miscellanies*, 3 vols.) appeared in 1743. It is a great book—a powerful satire, as unreasonably neglected as its literary descendant, Thackeray's *Barry Lyndon*. Saintsbury makes bold to compare it favorably with *The Tale of a Tub* and declares that, in his opinion, its author "has written no greater book" (introduction to *Jonathan Wild*, London, 1898). It was the year of the publication of this novel (1743) that saw also the establishment of the *True Patriot*, a semipolitical journal edited by Fielding, succeeded by the *Jacobite Journal*. The services of these journals 1745-48 to the Hanoverian cause resulted in the author's appointment to the position of justice of the peace for Westminster, a reward due to the good offices of Lord Lyttelton, a lifelong friend. Until his death at Lisbon, in 1754, Fielding administered the duties of his position honestly and zealously, as all may learn who will take up his *Journal of a Voyage to Lisbon* (published posthumously). Nor is this hard to understand, for he had himself tasted the many flavors of the cup of life; and such men are the best judges, unless they have grown bitter with the bitterness that is never wholly absent from the draft.

Though Fielding died comparatively early, his career was varied and his achievements lasting. Playwright, country squire, editor, novelist, man about town, stage manager, political pamphleteer, magistrate—all these parts he played, showing in them all the qualities which make it easy to understand the censure that has attended his life, but showing also those characteristics which justify the affection that all must feel for him whom Thackeray called "the manly, the English, Harry Fielding."

Bibliography. The first collected edition of Fielding was *Works* (London, 1762); other editions are those edited respectively by Scott and Roscoe (Edinburgh, 1840), by Browne (London, 1871), by Gosse (New York, 1898), and by Saintsbury (New York and London, 1902). Fielding's first biographer was Arthur Murray, whose essay on Fielding's life and genius was introduced in the first collected edition. (See above.) The best life is that of Austin Dobson (London, 1883). Consult: Lawrence, *Life and Times of Fielding* (ib., 1855); Leslie Stephen's admirable essay on Fielding in *Hours in a Library* (ib., 1874-79) and his article on Fielding in the *Dictionary of National Biography*, vol. xviii; Linder, *Henry Fielding's Dramatische Werke* (Dresden, 1895). Full and excellent critical introductions to each of Fielding's important works will be found in G. E. Saintsbury's edition of the *Works* (10 vols., London, 1898).

FIELDING, SARAH (1710-68). An English novelist, sister of Henry Fielding (q.v.). She wrote *The Adventures of David Simple* (1744), which in order of time is the third English novel of manners, and to which her brother contributed a preface. In 1762 she translated Xenophon's *Memorabilia* and *Apologia*; and she wrote also *The Governess* (1749), *Lives of Cleopatra and Octavia* (1757), and, with Miss Jane Collier, *The Cry: A Dramatic Fable* (1754).

FIELDING, WILLIAM STEVENS (1848-).

A Canadian statesman. He was born at Halifax, Nova Scotia, and was educated at the public schools of that city. In 1864 he became a reporter on the *Halifax Morning Chronicle* and later managing editor of that journal. He was elected a Liberal member of the Nova Scotia Legislative Assembly in 1882 and in the same year declined the provincial premiership offered to him by the Liberal Convention, but later became a member of the ministry formed by William Thomas Pipes. On the resignation of the latter in 1884, Fielding became his successor, retired from active journalistic work, and filled the position of Provincial Premier until 1896. In that year he was elected to the House of Commons and was appointed Minister of Finance in the Liberal administration of Sir Wilfrid Laurier. His tenure of that office for 15 consecutive years was unprecedented in Canada. In 1897 he introduced a measure which, while not repealing the moderately protective duties adopted by the Conservative party in 1879, imposed higher duties on luxuries and lower on necessities. Its most notable feature, however, was the preference whereby in 1900 certain kinds of British manufactured goods were admitted at rates lowered by 33⅓ per cent. Fielding also secured the arrangement of the tariff according to maximum and minimum schedules, and the enactment of an "anti-dumping" law preventing the entrance of foreign goods into the Canadian market at unfairly cheap prices. He was a delegate to the Colonial Conference in London in 1902 and to the Imperial Conference in that city in 1907. In the latter year, in conjunction with the British Ambassador at Paris, he negotiated the Franco-Canadian Commercial Treaty; in 1909 the Supplementary Treaty (with France); and in 1909-10 commercial arrangements with the United States, Germany, Italy, and Belgium. As Acting Minister of Railways, he had charge in 1903 of the negotiations resulting in the agreement to build the National Transcontinental Railway; he was appointed (1909) a member of the Royal Commission on improved trade between Canada and the British West Indies and was a delegate (1910 and 1911) to Washington in behalf of reciprocity with the United States. He procured various beneficial amendments to the banking and insurance acts. In 1901 he established a branch of the Royal Mint at Ottawa and in 1903 the penny-bank system. He declined knighthood in 1902. After the defeat of the Laurier administration in 1911 he remained the chief financial authority of the Liberal opposition.

FIELD KITCHEN. A military term denoting the place in camp where soldiers' rations are prepared. To what extent the kitchen will be furnished will depend on the permanency of the camp and the character of the undertaking or campaign. In the field the individual mess kit of a United States soldier is limited to one tin cup, knife, fork, and spoon, and meat can with handle, furnished by the Ordnance Department. The meat can may be used for individual cooking. The kitchen may be furnished as described under **FIELD COOKING**, or the camp may be sufficiently permanent in character to admit of the employment of field ranges and ovens. See **FIELD COOKING**.

FIELD LARK. In the United States, the meadow lark (q.v.). In Great Britain, the skylark or the pipit. See **TITLARK**.

FIELD MARSHAL. A military title of the highest rank in the armies of England, Germany, Austria, Russia, and Sweden. The rank is more nominal throughout continental Europe than in Great Britain, it being occasionally bestowed by one nation on the ruler of another. In the year 1818 the Duke of Wellington was field marshal in the armies of Austria, Prussia, and Russia. The rank was abolished in the French army in 1848. A lieutenant field marshal in Austria ranks as a general of division. The insignia of rank for a field marshal is the baton. In England the pay of the field-marshal commander in chief is £5000 per annum. In the spring of 1914 the following personages bore the title bestowed by the English government: the German Emperor, the Emperor of Austria, Duke of Connaught, Earl Roberts, Earl Kitchener of Khartoum, Lord Grenfell, Lord Methuen, Lord Nicholson, Sir Henry Brownlow, Sir Evelyn Wood, and Sir J. D. P. French, the last named resigning in the same year as chief of the Imperial general staff on the occasion of the agitation over the Ulster question. See **RANK AND COMMAND**.

FIELD MOUSE. See **MOUSE**.

FIELD OF BLOOD (It. *Campo di Sangue*). A name given to the battlefield of Cannæ (q.v.).

FIELD OFFICER. A military title applied to all officers above the rank of captain or company officer and under the rank of general officer. Commissioned officers may be divided into four general classes: general, staff, field, and regimental. The term "regimental field officer" includes all officers qualified by rank and assignment to command a battalion or regiment. They are always mounted. See **ARMY ORGANIZATION**; **RANK AND COMMAND**.

FIELD OF FORCE. See **FORCE**; **MAGNETISM**; **DYNAMO-ELECTRIC MACHINERY**; **ELECTRICITY**.

FIELD OF LIES, or **LÜGENFELD**. The plain of Rothfeld, near Colmar in Alsace, where in June, 833, Louis the Pious (q.v.) was shamefully deceived by his sons.

FIELD OF MARCH. See **CHAMP DE MARS**.

FIELD OF MAY. See **CHAMP DE MARS**.

FIELD OF THE CLOTH OF GOLD. The name given in English and French history to the place of meeting and interchange of civilities between Henry VIII of England and Francis I of France, from June 7 to June 24, 1520. The meeting occurred on a plain between Guisnes and Ardres in the present Department of Pas-de-Calais. The name originated in the gorgeous trappings and apparel of the participants and the splendor of the pageantry in the jousts and banquets which took place. Politically the meeting of the two kings was without result. Francis I indeed sought the aid and friendship of the English King against Charles V of Germany and had proposed to raise the English favorite, Wolsey, to the papacy if this result were accomplished. The meeting on the Field of the Cloth of Gold was followed by interviews between Charles V and Henry VIII at Gravelines and Calais, which more than offset the previous meeting of Henry with Francis. Shakespeare in *Henry VIII*, Act i, Scene 1, has put into the mouth of the Duke of Norfolk a graphic account of the encounter on the Field of the Cloth of Gold. Consult: Brewer, *The Reign of Henry VIII* (London, 1884); Ewald, *Studies Restudied* (ib., 1885); Martin, *Histoire de France*, vol. vii (Paris,

1856); Pardoe, *The Court and Reign of Francis I* (London, 1887).

FIELD OF VIEW. The space within which objects can be seen through an optical instrument; more strictly, the area from within which the pencils of light unite to form a real image.

FIELD PLOVER. In the United States, the local name of three different shore birds: (1) the Bartramian sandpiper (*Bartramia longicauda*), frequently called "upland plover," though not a plover at all; (2) the golden plover; and (3) the black-bellied plover. See **POLOVER**; **SANDPIPER**.

FIELDS, ANNIE ADAMS. See **FIELDS, JAMES THOMAS**.

FIELDS, JAMES THOMAS (1817-81). An American author and publisher. He was born in Portsmouth, N. H., and was educated in the public schools of that place. In 1834 he removed to Boston, and in 1839 he became junior partner in the publishing firm of Ticknor, Reed, and Fields, in which he later became the controlling partner. His charming personal qualities, his sympathy, his liberality to all with whom he dealt, and his sound literary judgment drew to him most of the best-known American authors of the time, and he became the publisher of Longfellow, Hawthorne, Emerson, Holmes, Whittier, and Lowell, besides introducing Tennyson and Browning to American readers even before their true worth was recognized in England. He edited the *Atlantic Monthly* from 1862 to 1870. The last 10 years of his life were spent in authorship and lecturing. His own published works include: *Poems* (1849; 2d ed., 1854); *A Few Verses for a Few Friends* (1858); *Yesterdays with Authors* (1872; 2d ed., 1900); *In and Out of Doors with Charles Dickens* (1876); *Underbrush* (1877), a volume of essays. He also edited, with Edwin P. Whipple, a *Family Library of British Poetry* (1878). Consult: Annie Adams Fields (his wife), *Memoir of James T. Fields, by his Wife* (Boston, 1881); also her *Authors and Friends* (ib., 1896).—ANNIE ADAMS (1834-1915), his wife, was born in Boston Mass. Her publications include: *Asphodel* (1866); *Under the Olive* (1880), a collection of verse; *How to Help the Poor* (1883); *A Shelf of Old Books* (1894); *The Singing Shepherd, and Other Poems* (1895); the *Life and Letters of Harriet Beecher Stowe* (1897); *Nathaniel Hawthorne* (1899); *Orpheus, a Masque* (1900); *Charles Dudley Warner* (1904).

FIELDS, JOHN CHARLES (1863-). A Canadian mathematician. He was born in Hamilton, Ontario, and was educated at the Hamilton high school and Toronto University, where he graduated in 1884 with the highest honors in mathematics. He afterward studied at Johns Hopkins University. In 1889-92 he was professor of mathematics in Allegheny College, Meadville, Pa., and in 1893-1900 he studied in Paris, Göttingen, and Berlin. In 1902-04 he was special lecturer in mathematics in Toronto University and in 1905 became associate professor. He is the author of papers in the journals of various American and foreign mathematical societies. In 1909 he was made a fellow of the Royal Society of Canada. He published *Theory of the Algebraic Functions of a Complex Variable* (1906).

FIELD SERVICE REGULATIONS. A military manual, for the guidance of armies, em-

bodying the principles of war and their application in the field. All modern armies publish such regulations from time to time, either under this or other titles. The purpose, character, and contents of the *Field Service Regulations, U. S. Army* (1914), is indicated in the following introduction to that book and in the titles of the parts into which the book is divided.

"The following Field Service Regulations, revised by the General Staff of the Army, are approved and published for the information and government of the Regular Army and the Organized Militia, and in time of war, the Volunteer forces. Success in war can be achieved only by all the branches and arms of the service mutually helping and supporting one another in the common effort to attain the desired end. The basic principles of the combat tactics of the different arms are set forth in the drill regulations of these arms for units as high as brigades. It is the function of higher troop leading to so combine and coordinate the combat tactics of all the arms as to develop in the combined forces the teamwork essential to success. While the fundamental principles of war are neither very numerous nor complex, their application may be difficult and must not be limited by set rules. Departure from prescribed methods is at times necessary. A thorough knowledge of the principles of war and their application enables the leader to decide when such departure should be made and to determine what methods should bring success. Officers and men of all ranks and grades are given a certain independence in the execution of the tasks to which they are assigned and are expected to show initiative in meeting the different situations as they arise. Every individual, from the highest commander to the lowest private, must always remember that inaction and neglect of opportunities will warrant more severe censure than an error in the choice of the means."

Synopsis of Table of Contents F.S.R., U. S. Army, 1914. *Organization:* Land forces of the United States, coast defense, overseas departments, tables of organization.* *Operations:* Information, security, orders, marches and convoys, combat, shelter. *Administration:* Service of the interior, service of the theatre of operations, the zone of the advance, the zone of the line of communications, transportation by rail, military police, censorship, field post office. *Appendices:* War strength in round numbers, road spaces, and dimensions of camps. Semipermanent camps, types of field intrenchments, forms of field orders, field maps and sketches, distinguishing flags and lanterns, extracts from international conventions and conferences, miscellaneous data, signals and codes. See **STRATEGY; TACTICS; WAR.**

FIELD SPANIEL. See **SPANIEL.**

FIELD SPARROW. A small sparrow (*Spizella pusilla*), common through the northern half of the United States in summer and going south in winter. It closely resembles the chipping sparrow in size and color, except that where that species is ashy this is suffused with brownish. It nests on or near the ground in fields and meadows, lays spotted eggs, and has a slender, pretty song, as if in weak imitation of the song sparrow. A Western form (*Spizella*

pusilla arenacca) has been separated, living in the Great Plains region.

FIELD SPORTS, or TRACK ATHLETICS. The various sports and competitions practiced in the open air (usually on a prepared track or course), and included under the general description of field sports, are principally as follows:

One hundred yards dash.....	(100 yards dash)
Two hundred and twenty yards dash.....	(220 yards dash)
Four hundred and forty yards dash.....	(440 yards dash)
One-half mile run.....	(880 yards run)
One thousand yards run.....	(1000 yards run)
Running one, two, and five miles.....	(1, 2, and 5 miles)
One hundred and twenty yards hurdle.....	(120 yards hurdle)
Two hundred and twenty yards hurdle.....	(220 yards hurdle)
Sack racing.....	(on the flat)
Sack racing.....	(over hurdles)
One mile walk.....	(1760 yards walk)
Running broad jump.....	
Running high jump.....	
Pole vaulting.....	(for height)
Pole vaulting.....	(for distance)
Throwing the sixteen pound hammer.....	(16 lbs.)
Throwing the fifty-six pound weight.....	(56 lbs.)
Throwing the discus.....	
Putting the sixteen pound shot.....	
Bicycling, from one-quarter to five miles.....	(440 yards-5 miles)

Other outdoor sports, such as cricket, football, fox hunting, golf, curling, lacrosse, paper chasc, etc., will be found described under their proper titles.

In 1884 the title of *All-Around Athletic Championship of America* was instituted, the programme of which consists of 10 events: the 100-yard dash, running high jump, running broad jump, pole vault, throwing 16-pound hammer, putting 16-pound shot, throwing 56-pound weight, 120-yard high hurdle race, half-mile walk, and one-mile run. The competitor scoring the highest percentage in the 10 events wins the title of All-Around Champion. Competitions are held annually. See **ATHLETICS.** The following measurements have been laid down as a fair average of what the proper dimensions of an all-around athlete should approximate:

HEIGHT	Weight	Chest	Waist	Hips	Thigh	Calf
ft. ins.	lbs.	ins.	ins.	ins.	ins.	ins.
5 6	120	35	27	34	20	13½
5 8	140	37	28	35½	21	14
5 10	155	39	29	37	22	14½
6	168	40	31	38	23	15

FIELD WORKS. Temporary devices, usually of earth, for immediate use, designed to increase the fighting power of troops occupying a position. See **FORTIFICATION.**

FIELITZ, FELITS, ALEXANDER VON (1860-). A German composer, born of Polish parents at Leipzig, Dec. 28, 1860. He studied piano with J. Schulhoff and composition with E. Kretschmer in Dresden. From 1887 to 1897 he lived in Italy, mostly in Capri, for the sake of his health. After his return to Germany he was for some time a teacher in Stern's Conservatory in Berlin. In 1905-08 he taught at Ziegfeld's Conservatory in Chicago, and also conducted the Chicago Symphony Orchestra, organized by himself and not connected with the orchestra of the same name (which then was the Theodore Thomas Orchestra). In 1908 he returned to his position at Stern's Conservatory. He is chiefly known as a composer of songs, of which the two cycles *Mädchenlieder* and *Eliland* are the best known. He also wrote some pieces for piano, two suites for orchestra, and two

* The *Tables of Organization, U. S. Army* (1914), giving all details, are published in a separate pamphlet.

operas, *Vendetta* (1891) and *Das stille Dorf* (1900).

FIERABRAS, fyá'rá'brá', or **FERUMBRAS**. A paladin of Charlemagne, whose name gave the title to various romances of the fourteenth and fifteenth centuries. One version appears in Caxton's *Lyf of the Noble and Cryslen Prynce, Charles the Grete* (1485). Fierabras carried away from Rome the crown of thorns and the balsam with which the body of Christ was embalmed and which possessed healing properties of the greatest efficacy.

FIERDING COURT, or **THING** (Scot. *ferding*, farthing, fourth part, from AS. *fēorþing*, *fēorþing*, farthing, from *fēorþing*, fourth). A district court of civil jurisdiction and of a popular character which existed among all the Germanic nations of western Europe before the establishment of the feudal system. There were usually four of these courts in every "hundred," and their jurisdiction extended to all causes where the matter in dispute did not exceed the sum of three marks, or 40 shillings. There are no traces of this court in English history after the Conquest, but it probably survived in the court baron or manorial court of a later day. All of those local and popular tribunals in course of time gave way before the advance of the national organization for the administration of justice. See **CURIA REGIS**.

FIERI FACIAS, fyé-rí fá'shí-ás (Lat., cause to be done). One of the most ancient writs known to English law, taking its name from two leading words in the mandatory clause of the instrument—*quod fieri facias de bonis et catallis*—that you cause (satisfaction) to be made of the goods and chattels (of the defendant). It was issued to the sheriff for the purpose of enforcing a judgment for damages and costs. Originally, as the clause quoted above indicates, it was leviable only upon personal property. If a judgment creditor wished to levy upon real estate, he was obliged to take out a writ of *elegit* (q.v.). Both writs have in most jurisdictions been superseded by the modern writ of execution (q.v.).

FIERY BOLETUS. See **FUNGI**, **EDIBLE** AND **POISONOUS**.

FIESCHI, fê-ès'ké, GIUSEPPE MARIA (1790-1836). A Corsican, known through his attempt on the life of King Louis Philippe. At first a shepherd, he later entered the Neapolitan army under Murat, became a sergeant and a member of the Royal Bodyguard, and was given the cross of the Two Sicilies for bravery in the campaign of 1812-14. With shameless treachery he twice betrayed the cause of Murat to the Austrians. In 1816, having returned to Corsica, he was sent to prison for 10 years for forgery and served his time at Embrun. After leading the life of a vagabond for a year, Fieschi came to Paris at the time of the July revolution and was employed by the police in a minor capacity. The immediate cause of his plot was his dismissal by order of the prefect of the Seine. Disguising his purpose under the cloak of political enthusiasm, he leagued with himself one or two persons of Republican enthusiasm who hated the government of Louis Philippe. These were Morey, a saddler; Pepin, a grocer; and Victor Boireau, a maker of lamps. Fieschi sketched the plan of an infernal machine with 20 barrels that could be simultaneously discharged, had one made, and placed it in a house on the Boulevard du Temple. The re-

view of the National Guard held there, July 28, 1835, afforded him the opportunity he desired. On the approach of the King and Queen he fired his machine. Eighteen people were killed, among whom was Marshal Mortier, who fell dead beside his sovereign. Louis Philippe, however, escaped with a mere scratch and was able to continue the review. The assassin was immediately seized and, with his accomplices, was tried, condemned, and executed Feb. 16, 1836. Consult: *Procès de Fieschi et de ses accomplices, devant la Cour des Pairs* (Paris, 1836), containing a biography of Fieschi; Blanc, *Histoire de dix ans* (Paris, 1842; Eng. trans., London, 1844-45); Du Camp, *Les ancêtres de la Commune: l'attentat Fieschi* (Paris, 1877); Thornbury, *Old Stories* (London, 1870); G. Weill, *La France sous la monarchie de Juillet* (Paris, 1902); Thureau-Dangin, *Histoire de la monarchie de Juillet* (ib., 1887-90).

FIESCO, fê-ès'ké. A tragedy by Schiller (1783).

FIESCO, or **FIESCHI**, fê-ès'ké, GIOVANNI LUIGI, COUNT OF LAVAGNA (c.1523-47). The head of a conspiracy against Andrea Doria (q.v.). He was born about 1523 and was a member of one of the oldest and most illustrious houses of Genoa. In organizing and planning his famous plot he seems to have been actuated by motives both of patriotism and class feeling. He belonged to the French, or popular, party, while the Doria were aristocrats and imperialists. Andrea Doria, the famous admiral, sprung from a race hereditarily at feud with the Fieschi, having expelled the forces of Francis I from the state, had made himself practically dictator at Genoa, and held the office of doge, while his nephew, Gianettino, commanded the galleys. Count Fiesco organized a plot, having for its object the death of Doria and Gianettino, whom the admiral had designated as his successor in power, and the establishment of an oligarchic form of government. He speedily enrolled a formidable array of accomplices, his three brothers among the foremost, and entered into secret negotiations with France and Rome and the Duke of Parma. Doria, in spite of repeated warnings, refused to ascribe treacherous or subversive designs to Fiesco, whom he regarded as a friend and partisan, and an alliance by marriage was even arranged between the families. Complete success seemed at first to crown the conspirators. When the attack was finally made, Jan. 2, 1547, the gates of the city were forced, the fleet was captured, Gianettino was assassinated, and Doria put to flight. The Count had but to appear and dictate, but he was nowhere to be found. It was finally discovered that, in stepping from one galley to the other in the darkness of night, he had stumbled and, falling overboard, was borne down by his ponderous armor and drowned in the harbor. This put an end to the conspiracy, and the whole Fiesco faction was dissolved by his death. Doria returned in triumph, and those of the Fieschi who were not slain were banished forever from Genoa. This episode has been the subject of many poems and dramas. Fiesco's fame is due to Cardinal Retz and especially to J. J. Rousseau, who made a cult of him. Schiller founded a tragedy on this dramatic event. Consult: Mascardi, *Historical Relation of the Conspiracy of the Count of Fieschi*, trans. by Hare (Edinburgh, 1886); Retz, *La conjuration du comte de Fiesque* (Paris, 1884); Brea, *Sulla congiura de conto*

G. L. Fieschi (Genoa, 1863); Sismondi, *History of the Italian Republics* (Eng. trans., New York, 1870); Petit, *André Doria* (Paris, 1887); Calligari, *La congiura del Fiesco* (Venice, 1892); Gavazzo, *Nuovi documenti sulla congiura del conte Fiesco* (Genoa, 1886); Acinelli, *Compendio della storia di Genova* (ib., 1750).

FIESOLE, fyá'zò-lá (Lat. *Fiesulæ*). One of the ancient Etruscan cities. It is situated on the crest of a hill, about 3 miles northeast of Florence. The heights of Fiesole (970 feet) command a remarkably beautiful view of Florence and the surrounding hills. In 225 B.C. Fiesole was the scene of a Roman defeat by the Gauls; here also Hannibal encamped after crossing the Apennines. The city was sacked by Sulla, who afterward dispatched thither a military colony, which was chosen by Catiline as his headquarters. During the Gothic rule in Italy, Fiesole was so strongly fortified and garrisoned as to endure a long siege by Belisarius. The growth of Florence during the Middle Ages gradually reduced it to insignificance. Pop. (commune), 1901, 17,176; 1911, 10,434. The only vestige of Etruscan structures still remaining is the cyclopean city wall, constructed of huge blocks of stone, many portions of which are wonderfully perfect. The site of the Etruscan fortress is now occupied by a convent, and interesting fragments of the foundations have been brought to light. To the Roman period belong the ancient theatre, small but well preserved, and some interesting ruins of baths. The church of St. Alexander contains 15 ancient columns and probably occupies the site of a Roman temple. The cathedral of San Romolo, begun in 1028 and restored in 1256, is an example of the simple early Romanesque style. Consult: Baedeker, *Northern Italy* (Leipzig, 1913); Dennis, *Cities and Cemeteries of Etruria* (2d ed., London, 1883); Nissen, *Italische Landeskunde*, vol. ii (Berlin, 1902).

FIESOLE, FRA GIOVANNI DA. See ANGELICO, FRA.

FIESOLE, MINO DA. See MINO DA FIESOLE.

FIÉVÉE, fyá'vá', JOSEPH (1767-1830). A French publicist and novelist, born in Paris. His *Sur la nécessité d'une religion* (1795), as well as many cutting epigrams, made him unpopular with the Directory, and he thought it prudent to withdraw to the country, where he spent his leisure in writing two clever novels, *La dot de Suzette* (1798) and *Frédéric* (1799). The advent of Napoleon to power brought Fiévée to Paris, where he became a loyal chronicler of the Consulate and the Empire. He left an interesting *Correspondance et relations avec Bonaparte* (4 vols., 1837).

FIFE (Fr. *flûte*, It. *piffero*, *pifara*, from OIIG. *pifa*, Ger. *Pfeife*, pipe, from ML. *pipa*, pipe, from Lat. *pipare*, to pipe, from onomatopoeitic (Ik. *pipárev*, *pipacein*, to chirp). An ancient wind instrument with six holes. It differs from the piccolo in that it has no keys. Its compass is two octaves from d' to d". The flûte is pitched in various keys, the most common being F and Bb. The flûte figures in the sculptured memorials of the Argonautic expedition and from that time to this has maintained its place as a simple yet effective instrument for martial purposes.

FIFE. See FIFESHIRE.

FIFE, ALEXANDER WILLIAM GEORGE DUFF, first DUKE OF, and MARQUIS OF MACDUFF (1849-1912). A British peer. He was educated at Eton and succeeded his father as the sixth Earl

of Fife in 1879. From 1874 to 1879 he sat in Parliament as a Liberal. From 1889 to 1898 he was vice president of the British South Africa Company. In 1889 he married Princess Louise Victoria Alexandra Dagmar, the eldest daughter of Edward VII, then Prince of Wales, and was created Duke of Fife. He was made Knight of the Garter at the coronation of George V, his brother-in-law. In December, 1911, with his wife and two daughters, he was shipwrecked in the *Delhi* on the coast of Morocco; and he died in Assuan, Egypt, six months afterward of pneumonia. He was an able business man and prominent in the Volunteer movement.

FIFENESS, fif-nēs'. A low headland, the easternmost point of Fifeshire, Scotland, lying on the north side of the Firth of Forth (Map: Scotland, F 3). To the north in the sea are the dangerous Carr rocks, with an iron beacon 35 feet high, which required six years to construct. Fifeness is in view of the Isle of May and Bell Rock lights. There still remain traces of a wall built by the Danes in the latter part of the ninth century.

FIFE RAIL. See BELAY.

FIFESHIRE. A maritime county of the eastern midland division of Scotland, between the Firth of Forth on the south and the Firth of Tay on the north (Map: Scotland, E 3). Area, 504 square miles; coast line, 108 miles, mostly rocky and having many small ports. The surface is a succession of cultivated vales and hills, agriculture being in an advanced state. The principal river, the Eiden, flows for 25 miles generally northeast into the North Sea. There are many coal and iron mines and lime quarries. Fifeshire ranks next to Lanarkshire in its production of coal in Scotland. Linens of all grades, oil cloth, paper, and malt liquors constitute the leading manufactures. Pop., 1801, 93,743; 1851, 153,540; 1901, 218,840; 1911, 267,739. Capital, Cupar. See SCOTLAND, *History*.

FIFTH MONARCHY MEN. An English sect of millenarians which appeared during the Puritan Revolution. It expressed belief in the literal interpretation of Daniel's prophecy that the four great monarchies of Antichrist—Assyria, Persia, Greece, and Rome—were to be succeeded by a fifth monarchy—the reign of Christ on earth for 1000 years. They differed from other Second Adventists in considering it a duty to assist the establishment of the new kingdom by force. In the expectation that the Commonwealth was the commencement of the new era, they joined Cromwell's army in large numbers. The march of events was, however, not sufficiently swift to please them; and in 1657, on the discovery of a plot to murder the Protector and to revolutionize the government, their leaders, Venner, Grey, Hopkins, and others, were arrested and kept imprisoned until after Cromwell's death. After the Restoration on Jan. 6, 1661, Venner, who was a wine cooper, led 50 associates in an attempt to take possession of London in the name of King Jesus. Those who were not killed were taken prisoners, and Venner and 10 others were hanged for treason. Consult: Masson, *Life of Milton*, vol. iii (Cambridge, 1859-64); Gardiner, *Commonwealth and Protectorate* (London, 1864-1901); Neal, *Puritans* (Portsmouth, 1816-17); Carlyle, *Cromwell's Letters and Speeches* (London, 1845).

FIG (AS. *fic*, OFr. *figue*, *fige*, from Lat. *ficus*, fig). The fruit of various species of *Ficus*, but especially the edible fruit of *Ficus carica*, a dioecious plant, 15 to 30 feet high, with rough, deep-lobed leaves, belonging to the Moraceae family. This plant, so far as known, is a native of Asia from Syria to Caucasus and Kurdistan. Like the date, it is an inhabitant of tropical and subtropical countries, and because it often bears three crops of edible fruit in a season, it was one

active where there is a suitable market for the fresh product. As a greenhouse plant, the fig is common everywhere outside the range of successful outdoor culture.

In the United States the fig has long been in cultivation in the Gulf States and even as far north as North Carolina, while in California it finds its most congenial conditions; it is here too that the closing years of the nineteenth century witnessed the successful estab-

lishment of caprifigation, as a result of which the production of Smyrna figs in California may be accepted as an established enterprise. Caprifigation is the name given to the operation commonly practiced by the natives of fig-growing countries. It consists in the tying of branches of the wild fig, or caprifig, in the tops of the cultivated trees. The caprifig, which is found wild in southern Europe, northern Africa, and western Asia, now cultivated in California, is the only fig bearing staminate flowers. It is therefore absolutely necessary that this variety be planted near cultivated sorts from which mature seeds are desired. Because of the peculiar structure of the fig fruit, the flowers being borne, as it were, on the inside of the receptacle, the process of pollination cannot be accomplished either by the wind or by ordinary insects. A peculiar hymenopterous insect, called *Blastophaga*, is an inhabitant of these wild figs in their native country and also visits the cultivated varieties; it is to them alone that the pollination of the cultivated sorts is due. Smyrna fig culture would be an impossibility without this insect. Until this fact was known all attempts at cultivating this fig outside of Smyrna were failures. Now, however, these figs can be quite as successfully grown in California as in the native country. A recent discovery of great importance to the industry is that the insect-bearing caprifigs may be carried through severe winters indoors if packed in boxes, the layers of figs alternating with layers of sand. As the Smyrna fig produces only pistillate flowers, without pollination, the fruits attain only partial development, no seeds are formed, and the delicate flavor which constitutes the

chief value of the Smyrna fruits cannot be secured.

Besides the caprifig (*Ficus carica*, var. *sylvestris*) and the Smyrna fig (*Ficus carica*, var. *smyrniaca*) there are numerous other sorts more or less commonly grown, which attain edible perfection without the aid of pollen of the caprifig and without developing seeds. These are roughly grouped under the name "common edible figs." Of this class, the Mission figs bear two crops annually, the early figs, or "brebas," and the late or "summer figs." This subclass includes almost all of the figs in California and in the Southern States. Another peculiar group known as the San Pedro figs, some of which are grown in California and in Florida and other Southern States, mature only one crop of fruit, the "brebas"; the second crop always falling before reaching maturity. This is explained by the fact that the first fruits contain so-called mule flowers, which can develop edible fruits,

FIG AND FIGPECKER.

A typical Italian cultivated fig ("fettifero") and the fig-pecking bird, the "beccafioc" (q.v.).

of the chief reliances of the peoples inhabiting its native country previous to the time when cereal grains were introduced into general cultivation. Besides being edible in a fresh state, the fig can be canned, preserved, or dried, in which conditions it is sold as a commercial article. Its chief importance, however, is as a dried fruit, thousands of tons being annually consumed in the United States and England alone. Found wild in the earliest inhabited countries, the fig has accompanied man in all his wanderings wherever a suitable climate has permitted its introduction. It was common in Greece during the time of Plato, was early carried into Italy and thence to Spain and Gaul. It was introduced into England prior to 1257 and has since maintained a more or less precarious existence as a standard in the south of England to this day. It is most successful when trained on walls and given winter protection. In such situations it bears well and is remuner-

while the fruits of the second crop contain only pistillate flowers, like those of the true Smyrna fig, and, as there is no pollen to fertilize them, they fall. In the Adriatic figs, a third subclass, these conditions are reversed; hence the "brebas" fail to develop. The United States Department of Agriculture recently announced the successful employment of a fig from Abyssinia in caprifying this "brebas" crop.

The fig is easily propagated either by budding, grafting, cuttings, or layers. In general, however, cuttings serve the purpose best. They are best made from the ripened wood of the previous season's growth. As the fig is not a hardy plant, its cultivation as a standard is limited. On the Atlantic seaboard it is confined to States south of Virginia, and in the West to California, where the most extensive orchards of America exist. The tree is long-lived, comes into bearing early, and consequently requires a free space in which to ripen its fruit; it is therefore frequently planted as an avenue or border tree. In the orchard it should be given 40 feet each way; and if grown with other plants these must be removed before crowding occurs.

All the dried figs grown in America are produced in California: outside this region the copious rains have a detrimental effect upon the fruits, rendering them unfit for the purpose. The dried fig output of California is steadily increasing. In 1886 the total output was estimated at 100,000 pounds. It reached an annual average of 10,000,000 pounds for the three years ending with 1913. During the same period the United States imported from Smyrna an average of 20,000,000 pounds annually. In a fresh state for table use the fig can be transported only a short distance. In recent years the canned-fig industry has assumed commercial importance in the Gulf States.

For a discussion of varieties suited for these various purposes, consult: Bailey, *Standard Cyclopaedia of Horticulture* (New York, 1914); Van Velzer, *Fig Culture* (Houston, Tex., 1909); "The Fig," *California Board of Horticulture* (Sacramento, 1890); "The Fig," *United States Department of Agriculture, Division Pomology, Bulletin 9* (Washington, 1901).

Fossil Fig. The fig and its allies are represented by numerous fossil remains, consisting almost entirely, however, of the leaves. The genus *Ficus* itself appears first in the Lower Cretaceous rocks, and it has been recognized in the Cretaceous deposits of Greenland, of Moravia, and in those of Kansas and Nebraska in the United States. Numerous species have been found in the Tertiary rocks, especially in the Eocene and Miocene deposits of Europe and North America. Few fossil remains of the genus *Ficus* have been found in the rocks of those regions where the fig now grows in its native condition. Consult Solms-Laubach, *Herkunft, Verbreitung, Domestikation der gewöhnlichen Feigenbäume* (Göttingen, 1882).

FIG, ADAM'S. See PLANTAIN.

FIG, INDIAN. See PRICKLY PEAR.

FIGARO, fè'gà'rò. 1. A famous dramatic character, central figure in Beaumarchais' comedies *Le barbier de Séville* and *Le mariage de Figaro*, a clever, witty, nonchalant rogue. Mozart made an opera of *The Marriage of Figaro*; Paisiello, and afterward Rossini, of *The Barber of Seville*. 2. In 1826 the name "Figaro" was chosen for a Parisian journal, since famous,

that counted among its contributors George Sand, Jules Sandeau, Alphonse Karr, Jules Janin, and other literary celebrities. It suspended in 1833, to be revived in even greater brilliancy in 1854 by its great editor, Villemessant (q.v.), whose *Mémoires* (1867) are a most valuable contribution to the history of French journalism. See MARIAGE DE FIGARO; NOZZE DI FIGARO.

FIGEAC, fè'zhàk' (Lat. *Figiacum*). The capital of an arrondissement in the Department of Lot, France, in a wooded valley on the right bank of the Selle, 32 miles east-northeast of Cahors (Map: France, S., G 4). It is irregularly built. The churches of Saint-Sauveur and Notre Dame du Puy, dating from the twelfth and fourteenth centuries, the Hôtel de Balène of the fourteenth century, are interesting and important. There is a fine obelisk to the memory of J. J. Champollion-Figeac, the Egyptologist, who was a native of the town. A college, library, and museum comprise its public institutions. It manufactures cotton, wool, and woodenware and carries on a trade in wine and cattle. There are zinc mines near by. Pop. (commune), 1901, 5861; 1911, 5808. The town arose around a Benedictine monastery founded in 755. It was captured by the Huguenots in 1576, and was one of their strongholds.

FIGEAC, J. J. CHAMPOLLION. See CHAMPOLLION-FIGEAC.

FIG EATER. See JUNE BEETLE.

FIG FOR MOMUS, A. A volume of poetical satires by Lodge (1595), dedicated to the Earl of Derby.

FIGGIS, JOHN NEVILLE (1866-). An English clergyman and historian, born in Brighton. He was educated at Brighton College, at St. Catharine's College, Cambridge, and at Wells Theological College, held several curacies, was lecturer at St. Catharine's in 1895-1901 and chaplain of Pembroke College in 1898-1900, and was Hulsean lecturer at Cambridge University in 1908-09, Noble lecturer at Harvard in 1911, and Bishop Paddock lecturer at the New York General Theological Seminary in 1913. In 1909 he became a member of the Community of the Resurrection. He contributed to the *Cambridge Modern History*; edited with R. V. Lawrence Lord Acton's *Lectures on Modern History* (1906) and his *History of Freedom, Historical Essays and Studies* (1907), and *Lectures on the French Revolution* (1910); and wrote *The Theory of Divine Right of Kings* (1896; rev. ed., 1914), *Illustrations of English History, 1600-1715* (1902), *Christianity and History* (1904), *Political Thought from Gerson to Grotius* (1907), *The Gospel and Human Needs* (1909, Hulsean Lectures), *Religion and English Society* (1910), *Civilization at the Cross Roads* (1912, lectures at Harvard), *Antichrist* (1913), and *Churches in the Modern State* (1914).

FIGHTING FISH. A small climbing perch (*Ottopis pugnax*) of southeastern Asia, and particularly of Siam, where it is very commonly kept captive for the amusement of its owners by its pugnacity. Two of these creatures when brought together often rush immediately to combat, or one will attack its own image in a mirror. Fish fights are a favorite amusement of the Siamese; the license to exhibit them yields a considerable annual revenue; and an extraordinary amount of gambling takes place in connection with them. The fighting fish has the

anal and dorsal fins prolonged into tapering points. When the fish is quiet, its colors are dull; but when it is excited, they glow with metallic splendor, and the projected gill membrane waves like a black frill around the throat.

FIGHTING JOE HOOKER. A nickname given to Gen. Joseph Hooker (q.v.).

FIGHTING PARSON, THE. A nickname given to W. G. Brownlow (q.v.).

FIGHTING PRELATE, THE. A name given to Henry Spenser, Bishop of Norwich, who fought against the insurgents in the rebellion of Wat Tyler and later led an army into Flanders.

FIGHTING TÊMÉRAIRE, tá'má'râr', THE. See TÊMÉRAIRE.

FIGIACUM. See FIGEAC.

FIGIG, fê-gêg'. An oasis in the eastern part of the Moroccan Sahara, near the Algerian frontier, covering an area of about 6 square miles, well watered, and containing large groves of date palms (Map: Africa, D 1). It has about 13,000 inhabitants, dwelling among 10 fortified villages, the chief of which is Senaga. The inhabitants nominally recognize the sovereignty of Morocco, but are independent in their internal affairs. The chief industries are fruit raising, cloth weaving, and manufacture of clothing.

FIGLINE, fê-lyé'nâ. A city of Florence, central Italy, 25 miles southeast of Florence, on the left bank of the Arno, in the valley of which near here have been found many fossil mastodons, hippopotami, tigers (Map: Italy, F 4). The town markets silk, wine, and oil, and manufactures straw goods and knives. Pop., 1901, 11,478; 1911, 12,035.

FIG SHELL. Any of various tropical gastropod shells, of the genera *Ficula*, *Pyrula*, etc., so called from their shape. One of the best known is *Pyrula ventricosa*, of Oriental waters, which has a very extensive foot, like its relatives the tun shells (q.v.), and the mantle large-lobed,

A FIG SHELL (*PYRULA VENTRICOSA*).

1, dorsal view of the shell and expanded muscular parts.
2, ventral view, showing the extended siphon, head, with two short tentacles, and the oblong creeping muscle or "foot."

reflexed upon the shell, and profusely spotted. The shell is pear-shaped, has a long siphon canal, and the surface is transversely ridged. Several other species belong to the genus, which goes back to the Chalk and Tertiary periods.

FIGUEIRA, fê-gâ'ê-râ, or FIGUEIRA DA FOZ DO MONDEGO. A seaport town in the District of Coimbra, Portugal, situated at the mouth

of the Mondego River, about 25 miles west by south of Coimbra (Map: Portugal, A 2). It is connected by rail with Lisbon and Oporto. The harbor is small and obstructed by a bar, but the town has considerable trade in salt, wine, fruit, and oil. Figueira is much visited for its bathing. Pop., 1890, 5676; 1900, 7890.

FIGUERAS, fê-gâ'râs. A town in the Province of Gerona, Spain, situated in the centre of the Ampurdán, 14 miles from the French frontier and 21 miles north-northeast of Gerona (Map: Spain, G 1). On a height (480 feet) near the town is the pentagonal citadel of San Fernando, one of the strongest fortresses of Spain and the key of the Pyrenees. It was constructed in the latter half of the eighteenth century and admits a garrison of 16,000 men. This fortress has been so frequently taken by the French as to give rise to the common saying that in time of peace it belongs to Spain, but in time of war to France, having been captured by the latter in 1794, 1808, 1811, and 1823. The fertile plain of Ampurdán produces oil, fruit, grain, and wine, and the town has manufactures of soap, leather, liquors, alcohol, etc. It contains a secondary college, a civil and military hospital, and an asylum for the aged. In the parish church here Philip V married Maria Louise of Savoy in 1711. The antiquity of Figueras has been proved by the discovery of a Latin inscription dating before the Christian era. Pop., 1900, 11,084; 1910, 11,778.

FIGUERAS Y MORACAS, é mō-râ'kâs, ESTANISLAO (1819-82). A Spanish statesman. He was born at Barcelona, studied law at Madrid, entered politics, and became active in the Republican ranks. He was elected to the Cortes from Barcelona in 1851 and became the principal spokesman of his party. He was exiled in 1867 for complicity in a plot against Narváez, but returned after a few months. After the revolution of 1868 and the expulsion of Queen Isabella, he joined with Castelar, Salmerón, and Pi y Margall in actively opposing the reestablishment of the monarchy, and in 1870, when, in spite of their efforts, Amadeus of Savoy became King, Figueras continued to oppose him. Upon the abdication of the King in 1873 and the establishment of the Republic, Figueras was made President of the Provisional Council of Ministers, a position which he held until the Constituent Cortes established a new cabinet. Figueras remained in the Cortes, a strong supporter of the Republic, until the restoration of the monarchy, December, 1874, when he retired to private life.

FIGUEROA, fê-gâ-rô'â, FRANCISCO ACUÑA DE (1791-1862). An Uruguayan poet, born in Montevideo. He was educated at Buenos Aires in the College of San Carlos, where he early distinguished himself by his metrical compositions in Latin. His first great work was an historical diary in verse describing the great siege of Montevideo in 1812-14. His poetical works cover a wide range of subjects, are written with great perfection in many different metres, and are considered Spanish-American classics. Figueras published his poems under the title *Mosdico poético* in 1857.

FIGUEROA, fê-gâ-rô'â, FRANCISCO DE, (EL DIVINO) (c.1540-1620). A Spanish lyric poet, a contemporary and fellow townsman of Cervantes, having been born at Alcalá de Henares. Little is known of him, beyond the fact

that he served for a time in a Spanish regiment in Italy, that he studied at Rome and Bologna, that soon after his return to Alcalá he made an advantageous marriage, and having won the favor of Don Carlos of Aragon accompanied him to Flanders in 1579. Shortly before his death Figueroa gave orders that all his poems should be burned. Most of those that escaped were afterward collected and edited by Luis Tribaldos de Toledo, to whom we owe these scanty details of his life. The first edition appeared in Lisbon, 1625; and the second, considerably enlarged and preceded by a brief discourse on the poet's life, appeared in Lisbon, 1826. The poems include sonnets, canzoni, elegies, and an eclogue, *First*, the name by which the poet himself was introduced by Cervantes in his pastoral *Galatea*. Figueroa was a disciple of Boscan and Garcilaso, both of whom he surpassed in his mastery of blank verse. His best-known sonnet is that written upon the death of Garcilaso's son. He shared with Francisco de Aldana, Fernando de Herrera, and Miguel Sánchez the title of *El Divino*. A selection of six of his poems is given in the *Biblioteca de Autores Españoles*, vol. xliii. Fifteen previously unedited poems were published by R. Foulché-Delbos in *Revue Hispanique*, vol. xxv, pp. 317-343 (Paris, 1911), with a complete bibliography. Consult also the facsimile reproduction of the *Obras* (1626 edition) made by Archer M. Huntington (New York, 1903).

FIGUEROLA Y BALLESTER, fə'gá-ró'lá & bá'lýēs-tár, LAUREANO (1816-1903). A Spanish political economist, born at Calaf (Barcelona). He became professor of political economy in the University of Barcelona and subsequently of commercial law at Madrid. As Minister of Finance, from 1866 to 1870, he did much to improve the wretched condition of the Spanish treasury. Among other reforms that he proposed were a reduction in the number of bishoprics and clergy and the reduction of the standing army by one-half. Upon the accession of Amadeo I he retired to his professorship and continued teaching his doctrine of free trade. In 1872 he was again forced into politics by being elected President of the Senate. In 1885 he was elected counselor for the District of Latina in Madrid, and the Council appointed him Syndic. From 1898 until his death he was president of the Real Academia de Ciencias morales y politicas. He published the *Estadística de Barcelona* (1849-54).

FIGUIER, fə'gyá, GUILLAUME LOUIS (1819-94). A French chemist and scientific writer. He became professor of chemistry at Montpellier in 1846 and at Paris in 1853 and carried out some original investigations. Later he devoted his time chiefly to the popularization of science. He became scientific editor of *La Presse* and afterward of *La France*. His works and contributions to scientific journals include some 80 volumes, many of which were translated into English. Among these are: *Exposition et histoire des principales découvertes scientifiques modernes* (4 vols., 1851-53; 8th ed., 1862); *Histoire du merveilleux dans les temps modernes* (4 vols., 1859-62); *L'alchimie et les alchimistes* (3d ed., 1860); *Vies des savants illustres depuis l'antiquité jusqu'au XIXème siècle* (5 vols., 1865; 2d ed., 1872-75); *Les merveilles de la science* (4 vols., 1866-69; new ed., 1911); *Les merveilles de l'industrie* (4 vols., 1873-76); *Les nouvelles conquêtes de la science* (4 vols.,

1883-85); *Les mystères de la science* (2 vols., 1887).

FIG'ULINE. A term sometimes given to vessels or objects, especially ornamental ones, made of potter's clay. Palissy's rustic figulines are well known.

FIGULUS, PUBLIUS NIGIDIUS. See NIGIDIUS FIGULUS, PUBLIUS.

FIGURATE NUMBER. See NUMBER.

FIG'URE, or **FORM** (Lat. *figura*, from *fin-gere*, to fashion, to feign; connected with Gk. *βιννύνειν*, *thinganein*, to touch, Skt. *dih*, to smear; Goth. *deigan*, to knead, OHG. *teic*, Ger. *Teig*, Icel. *deig*, AS. *dāh*, Eng. *dough*), **PERCEPTION OF**. The spatial attribute of extension (q.v.) is ascribed only to certain classes of sensations, the visual and tactual; spatial relations, on the contrary, are predicable of all sensations alike, since all are localizable. Form, or figure, as used in psychology, is defined (Kuelpe) as "the general term comprehending all the spatial characteristics that can be *attributively* predicated of an impression." The perception of the figure of an object may then be regarded as the perception of a sum of extensions, and the problems involved are limited in their application to those sense departments to which extent may be assigned.

The cutaneous perception of figure has received but little investigation. Experiments made with certain stimulus forms—angles, open and filled circles, filled triangles—upon the tip of the tongue, the lips, and the tip of the middle finger, showed that the open circle is most easily cognized, and that the capacity of the surfaces for cognition of the forms is, in order of excellence, tip of tongue, tip of finger, lips. This dependency of the form limen upon the place stimulated is illustrated by the simple experiment of drawing a pair of dividers along the arm from the elbow to the finger tips, or from the lobe of the one ear to the lobe of the other, across the face. The objectively parallel lines seem to diverge towards the wrist, and as they pass the lips. The cutaneous limen for form is susceptible of marked decrease through practice.

The visual perception of figure may, like the perception of simple extension, be obtained by the resting eye in monocular vision, but for its full development binocular vision is essential. The visual perception of figure furthermore involves not only the perception of surface, but also the perception of depth, or the apprehension of extension in the third dimension. One problem of the perception of surface consists in reconciling the fact that the field of vision presents a continuous surface with the fact that the sensitive parts of the retina, the rods and cones, form a mosaic of discrete points separated by nonsensitive areas. (The diameter of a retinal cone is estimated at 0.0015-0.0044 millimeter, and the distance from the centre of one cone to the centres of adjacent cones at 0.0040 millimeter.) Explanations have been made in terms of binocular vision, of eye movement, and of our a priori bias towards continuity. See also **BLIND SPOT**.

Of special importance to the perception of the third dimension of figures are those optical phenomena known as the prevalence and rivalry of contours. When we observe the form of an object, the images which are cast upon the retinas of the two eyes differ slightly, owing to the difference in the position from which the

two eyes view the object. If now these two images completely fused, the principal factor in the perception of depth would be removed; if, on the other hand, the two images remained obstinately disparate, it would be impossible to refer them to a single external object. It is the "prevalence" and "rivalry" of contours which "prevent the fusion of the two retinal images and secure to each a certain amount of independence" (Hering), although "the impressions of the two eyes always fuse to a single idea" (Wundt). The contour phenomena are easily demonstrable with the aid of the stereoscope. If, e.g., the right eye be stimulated by a uniform surface of white, and the left eye by a black letter A upon a white background, we have a striking instance of the prevalence of contour. The A is not made grayish, not washed over by the white of the right monocular field, but is seen in perfect clearness in the resultant single field; its contour suppresses or prevails over the surface presented by the white field. If each retinal field contains contours, and these contours possess little congruence, the phenomenon of "rivalry of contours" is observed. Thus, if the letter U were presented to the left eye and W to the right, or a vertical black band to the left eye and a horizontal black band to the right, there would be no fusion of the two images, nor would either image permanently prevail over the other; but there would be a rivalry and alternation of the two fields.

The visual perception of form plays an important part in the production of what are known as the "elementary æsthetic feelings." (See *ÆSTHETICS, EXPERIMENTAL*.) Finally, the perception of figure is extremely subject to illusion; small angles are overestimated, the height of a square is overestimated, etc. (See article *ILLUSION*.) And the study of illusory figures has, in turn, thrown a reflex light upon the psychology of the form perception. It has been found that the predisposition of the observer is important for the result: if the experimenter, e.g., prescribes a certain direction of attention, the perception may be modified. When, therefore, we speak of figure as a "sum" of extensions, we should add that this sum is to be taken in the integrative or psychological sense, and not in the sense of mere mechanical addition. (On the mechanism of this integration, see *DETERMINING TENDENCY; PERCEPTION*.) Consult: Titchener, *Experimental Psychology* (New York, 1901); Wundt, *Human and Animal Psychology* (Eng. trans., London, 1896); Külpe, *Outlines of Psychology* (ib., 1909); Witasek, *Grundlinien der Psychologie* (Leipzig, 1908).

FIGURED BASS, or THOROUGH BASS. A system of musical notation in which chords are denoted by placing figures over the bass note. It was first used in Italy during the latter part of the sixteenth century. The original object was to furnish the organist with a simple means of recognizing at a glance the necessary harmonic foundations in large choral or instrumental works. (The arrangement of the different parts in a score (q.v.) was not known then.) Playing from figured bass was a great art, because this system of notation indicates only the chord or its inversions, but nothing as to the leading of the various voices. To-day the art is not called for, as modern scores are written out in detail, and the figured bass in scores of the older masters (Bach, Handel) has been written out by eminent masters. (See *FRANZ*.) Fig-

ured bass plays an important part in the study of harmony, as all exercises are written in figured bass notation. Only the bass note is written. If no figure appears above the note, the

ordinary triad is meant; the figure 6 denotes the first, $\frac{7}{6}$ the second inversion. The dominant seventh is expressed by 7; its inversions by $\frac{7}{6}$, $\frac{7}{4}$, 2 respectively. Suspensions are expressed by two figures—the first indicating the dissonance, the second its resolution. The interval of the third is not written out unless chromatically altered. Chromatic alterations are denoted by the usual signs placed before or after the figure 3 \sharp , 5 \flat , 0 \sharp . Sharps are also indicated by a line through the figure, $\frac{7}{6}$. In figured bass all intervals are counted from the bass note, not the fundamental. For further information or complete exposition of the theory of figured bass, consult Richter, *Manual of Harmony* (trans. by Theodore Baker from the 25th German ed., New York, 1912). See *ACCOMPANIMENT*.

FIGUREHEAD. A figure, or image, either a head, or bust, or full length—usually carved from wood, but in more recent vessels composed of hollow-cast bronze, carried at the prow or stem of ships. Its form is frequently dependent upon the name of the ship; the United States ship *Delaware* had the head of an Indian, supposedly of the Delaware tribe; the *Macedonian* had the bust of a Macedonian warrior, etc. The custom of placing figureheads on vessels of war is very ancient; the Phœnicians, Egyptians, Greeks, Romans, and Northmen all placed images of their deities or of other persons, or animals, or objects upon the prows of their war galleys. The change from sail to steam, the removal of the bowsprit and substitution of the straight stem, caused the old types of figurehead, scrollhead, billet-head, fiddle-head, etc., to disappear. For some years the ornamentation was placed on each side of the upper plating near or on the stem and consisted of scrollwork, the national coat of arms, etc., in gilt and colors. In some European navies and in passenger ships of the merchant service this practice still continues, but in the United States navy the figurehead and all other ornamentation have been entirely given up.

FIGURES OF A SYLLOGISM. Classes of the traditional categorical syllogism (q.v.) obtained by dividing syllogisms according to the relative positions of the major, middle, and minor terms. (See *MAJOR*.) Designating these terms respectively by the conventional symbols P, M, and S, we have these four classes of figures represented by the following formula, in which the four vertical columns to the right give the four figures respectively:

	I	II	III	IV
Major premise.....	M P	P M	M P	P M
Minor premise.....	S M	S M	M S	M S
Conclusion.....	S P	S P	M S	S P

See *LOGIC*.

FIGURES OF SPEECH. The general term under which are comprised all deviations in the use of words from the literal sense or from

the literary or common forms and constructions. Such deviations have at different periods been variously classified and minutely differentiated. At the present time the tendency is towards greater generalization. The deviations from common use may be classified as figures of thought (figures of rhetoric) and grammatical figures (figures of etymology and figures of syntax). The individual figures are treated under ETYMOLOGY, FIGURES OF; SYNTAX, FIGURES OF; and RHETORIC, FIGURES OF. In addition to these classes older authorities recognized a fourth, figures of orthography, the subclasses of which were called mimesis and archaism—mimesis representing the imitation in spelling of illiterate or provincial speech, as in the modern dialect stories; and archaism, the reproduction of antiquated orthography and form. The FIGURES OF ETYMOLOGY, concerned entirely with the forms of words, are employed chiefly for their effect on rhythm and poetry. The omission of an initial letter (aphæresis), as *'gainst* for *against*, or of a letter within a word (syncope), as *ne'er* for *never*, or the separation of parts of a compound (tmesis), as *how good soever*, have almost no application to common speech or prose writing. The FIGURES OF SYNTAX, or deviations in the construction, on the other hand, are in constant and unconscious use by speakers of all classes and ages. Their use adds directness, picturesqueness, and force to language. Of the figures of syntax, ellipsis is the most common and appears in exclamations, commands, and energetic utterances of many kinds. It consists in the omission of a word, phrase, or clause theoretically essential, the absence of which, however, heightens the effect of the words. Thus, *Here!* is more striking than *Come here*. *Bread* may be equivalent to *Give me some bread*; and in many business forms and in signs a word or two may have the value of a whole sentence, as *No smoking*, for *Smoking is not permitted*. Emphasis is gained by the figure called redundancy (the use of unnecessary words to express an idea); e.g., *I did it my own self*. The FIGURES OF RHETORIC, or deviations from the usual application of words, add grace and beauty to the expression of thought and increase the resources of speech. Therefore they appear constantly in poetical composition and are frequent in prose and ordinary conversation. Simile requires a connective, pointing out the comparison: He is *as* brave *as* a lion; metaphor omits it: He *is* a lion. Such expressions as *roof* for *house* (synecdoche), or *gray hairs* for *old age* (metonymy), are figures in very common use founded on contiguity; and all the figures may be referred to the conscious or unconscious tendency towards enlarging the boundaries of language and heightening the emphasis of speech.

FIGWORT FAMILY. See SCROPHULARIACEÆ.

FIJI (fĕ'jē) or **VITI** (vĕ'tē) ISLANDS. A group of islands and a crown colony of Great Britain, in the southern Pacific, between lat. 15° 50' and 20° S. and long. 176° 40' E. and 178° W. (Map: Australasia, K 4). It is the largest and most valuable group in Polynesia. It consists of about 200 islands, of which about 80 are inhabited and among which the most important are Viti Levu (4250 square miles), Vanua Levu (2600), Taviuni (217), and Kandavu (150). The total area, including the island of Rotumah, lying north of the group and added thereto in 1880, is estimated at 7435 square

miles. The larger islands are mountainous, with elevations of 4000 feet, and one of 5000 feet above sea level. The islands on the south and southwest side of the group are clothed with dense forests containing many valuable woods. The coasts are surrounded by coral reefs and form many good harbors. The islands are very fertile and well provided with rivers, of which the Rewa, the Ba, and the Singatoka, all on Viti Levu, are navigable in their lower courses through the coastal plain. In spite of their tropical situation the Fiji Islands have a comparatively cool climate. The temperature seldom rises above 90° F. or falls below 60° F. The rainfall is abundant, although unequally distributed. Severe hurricanes occur from time to time and cause immense damage to plantations, etc. These rotary storms or cyclones usually occur from December to April. Owing to their sanitary precautions, Europeans enjoy almost complete immunity from the diseases common to the Fijians and the Indian coolies. The flora of the islands is exceedingly rich. The principal native plants are yams, coconuts, bananas, and breadfruit. Sugar cane was introduced by European planters. The economic prosperity of the colony depends on three staple industries—the production of sugar, of copra, and of fruit, principally bananas and pineapples. The cultivation of corn and cotton, formerly important, has greatly declined. The sugar export increased from 32,961 tons (valued at £393,987) in 1900 to 72,834 tons (£797,274) in 1911; copra increased from 15,605 tons (£151,701) to 16,337 tons (£204,245); fruit increased from £28,112 to £151,607. There are also exports of Trochus shell, molasses, coconuts, cacao, bêche-de-mer, and bark. About 80 per cent of the trade is with Australia and New Zealand. There is no direct communication with the United Kingdom, but regular steam communication is maintained with Sydney, Auckland, Samoa, and Tonga. The total tonnage entered and cleared increased from 349,655 tons in 1902 to 613,343 tons in 1912. Total imports and exports, in 1902, £526,847 and £535,171; in 1912, £940,044 and £1,058,960. Suva, the capital, is connected by cable with Brisbane and Canada, and is an important aërograph station.

The colony is administered by a governor appointed by the crown. An executive council is composed of the governor and six official members. The legislative council consists of the governor and 10 official members, six elected members, and two native members. The colony is divided into 17 provinces, each under the control of a European commissioner or a chief native officer. A large share of self-government is conceded to the natives; their system of village and district councils has been recognized and improved, and is supplemented by an occasional meeting of the high chiefs and provincial representatives, presided over by the governor. An advisory board, consisting of the governor and British and native officials, formulates regulations in respect of native marriage and divorce, property succession, the powers and procedure of the native courts, and various other matters relating to the well-being of the native population. These regulations must receive the sanction of the legislative council before acquiring legal force. The seat of government was transferred from Levuka, in the island of Ovalau, to Suva, in Viti Levu, in 1882. The Dependency of Rotumah is administered by a European com-

missioner. In 1910 the revenue (of which over half is derived from customs) and expenditure of the colony were £211,952 and £236,661 respectively; in 1912, £238,947 and £268,158. Public debt (1911), £93,615.

The population of Fiji has been returned by the census as follows: 1891, 121,180 (of whom 105,800 Fijians); 1901, 120,124 (94,397); 1911, 139,541 (87,096). It is to be noted that, while there was a considerable increase in the total population during the last decade, the native race continued to decline. It was estimated in 1808 at 170,000; by the epidemic of measles in 1875 it was reduced by more than one-fourth. In 1911 males numbered 80,008, and females 59,533. The total was made up as follows: Fijians, 87,096; Indians, 40,286 (17,105 in 1901); Europeans, 3707; half-castes, 2401; Polynesians, 2758; Rotumans, 2176; Chinese, 305; others, 812. The Wesleyan mission reported 84,306 adherents at the end of 1911, and the Roman Catholic mission 10,592. Native education is provided chiefly by these missions, the Wesleyan schools numbering 1002 and the Roman Catholic 124. Suva, the capital, on a fine harbor on the south coast of Viti Levu, had a white population of 1376.

While somatically the Fijians are in basic association with the Melanesian race, there are recognizable traces of Polynesian admixture. At least two such mixtures are readily identifiable. One is superficial and somewhat narrowly confined to the eastern district, which the island geography denominates Lau. This mixture is quite modern, the result of intercourse with the neighboring Tongans which there is evidence to restrict to the last three centuries. The other mixture is a more general factor in the race and is of wider extent, for it is as plainly to be seen in the mountaineers of the great island as in the coast people. It is manifest in the bodily measurements, for the Fijians in stature and proportions more closely approximate the Polynesians than they resemble such Melanesians as are established as of pure stock; yet in the minor bodily characters, such as pigmentation, hair section, contour of the outer ear, and interstitial measurement of skin pores, the Fijians show wholly Melanesian character. The period of the great contact of the two races which has established this mixture is not yet definitely determined, but it lies at one of the two great historic events in the Polynesian settlement of the Pacific—the later being the incoming of the later, or Tongafiti, branch of the race, concerning which Samoan history establishes the last period in the expulsion of the Tongafiti in the onfall of Matamatame about 700 years ago. The earlier period of Fijian mixture lies at least 1000 years earlier. Present research into the problem will probably result in the establishment of the earlier date. The language betrays the double origin, the vocabulary having drawn very largely upon Polynesian, the grammar being of Melanesian complexity and precision. The Fijians have taken from the Polynesians the use of kava, have given to them (according to Samoan testimony) the art of tattooing, practice the Melanesian art of pottery with no little success, are cautious navigators, and excel in canoe building. In social condition they fell far below the Polynesians; for the power of the chiefs, while enormous in the individual, lacked the hereditary quality by which families become great. Cannibalism was practiced with great gastro-

nomic delight and remained in the most frequent use down to the annexation to Great Britain, and even as late as 1892 appeared in a sporadic recrudescence of the ancient habit. In the savage state the Fijians were constantly engaged in wars, yet the casualty list was insignificant. The decline in their numbers began with the suppression of this exit for their animal spirits, with the interruption of their polygamy entailing a greater infant mortality, particularly with the introduction of alien diseases to a field in which protective immunization had not been acquired. The picture of the vital statistics is not yet a satisfactory one, but at each of the census periods there is observable a decrease in the rate of mortality which leads to the hope that the people will before long take the upward track.

Some of the islands of the Fiji group were discovered by Tasman in 1643 and visited by Cook in 1773, who discovered several others in the same group. The first accurate knowledge of the archipelago was obtained through the explorations of Dumont d'Urville in 1827 and of the American expedition under Wilkes and Hale (1840-42). Though fugitive convicts from Australia settled in Viti Levu as early as 1804, the European population grew very little, owing to the hostility of the natives, who were numerous, warlike, and addicted to cannibalism. Wesleyan missionaries reached the islands in 1835 and in 1854 succeeded in converting not only Thakombau, the most powerful of the native chiefs, but the mass of the people also. Complications with the United States led Thakombau to offer the sovereignty over the islands to Great Britain (1858). The proposal was declined. Between 1860 and 1869 immigration was rapid, 1800 settlers being there in the latter year. An attempt to establish a parliamentary government under Thakombau did not prove successful, and the offer to Great Britain was renewed and accepted (1874). In 1878, when sugar begun to be extensively cultivated, the native Fijians began to deteriorate because of the competition of the coolies from India. In 1900 an attempt made by New Zealand to add the Fijis to herself failed because the Colonial Secretary would not sanction it. FILANDER. See KANGAROO.

FILANGIERI, fē'lan-jyā'rē, GAETANO (1752-88). An Italian jurist, author of a monumental treatise, *La scienza della legislazione*. Born in Naples, of a noble family, he was trained for a military career, which he soon abandoned for legal and scientific studies. When barely 20, he published his first work, *Public and Private Education*. Among his early successes as a lawyer was an able defense of a royal decree, which won him the appointment of court advocate and led to various other offices and honors from the King. The first three parts of his principal work appeared in 1780-83 and incurred

the censure of the Catholic church. Ferdinand IV, however, rewarded the author with a pension and relieved him from all his court duties. The *Scienza della legislazione* (1780-88), which was to have consisted of seven books, but remains incomplete, was evidently written under the influence of Montesquieu, but shows the effects of Vico, Giannone, and Rousseau. It has the defect, characteristic of the century, of subordinating empirical research to deduction from philosophical principles and is somewhat colored by local problems of Neapolitan government; but this great work is still of use.

His son, CARLO (1784-1867), Prince of Satriano, was born in Naples. He entered the French army, was made a captain at Austerlitz, and fought in Spain with Murat. In 1849 he became Viceroy of Sicily under Ferdinand II, and he was made Minister of War by Francis II in 1859. He held this office for one year, when he fell from power, and did not again enter politics.

FILARETE, fē'lā-rā'tā, ANTONIO (called also ANTONIO AVERULINO) (c.1400-70). A Florentine sculptor of the Renaissance. He probably assisted Ghiberti on the doors of the baptistery at Florence and was engaged by Pope Eugene IV to execute the bronze doors for St. Peter's in Rome (1433-45), now used for the central entrance of the church. His work is an inferior imitation of Ghiberti's masterpiece, but the reliefs are clumsy, the figures lifeless, and the subjects represented are a strange mixture of Christian and pagan thought. The figure of St. Mark over the entrance of San Marco is also attributed to him, as well as the tomb of the Cardinal of Portugal (except the effigy) in the Lateran, but without sufficient proof. He was afterward banished from Rome and was invited to visit Milan by Francesco Sforza, for whom he began the Ospedale Maggiore, but lived to complete only the right wing. He was one of the many architects employed on the cathedral at Milan and constructed the cathedral at Bergamo. He wrote a curious and interesting treatise on architecture, *Trattato di architettura* (1460-64), in which he described an ideal city, called Sforzinda. This work remained in manuscript until 1890, when it was published in Vienna. Consult Von Ottingen, "Leben und Werke des Antonio Averulino," in *Beiträge zur Kunstgeschichte*, new series, vol. vi (Leipzig, 1888); and especially Lazzaroni, *Filarete, scultore et architetto del secolo XI* (Rome, 1908).

FILARIA (from lat. *filum*, thread). A parasite found in the blood, lymph, and other fluids of the human body. It was first seen by Demarquay, in 1863, in a fluid obtained from a galactocoele, and was identified in 1866 by Wucherer of Brazil. In 1868 Salisbury found the eggs in human urine. In 1872 T. R. Lewis found filariae in the blood. *Filaria medinensis*, or Guinea worm, is found in different tissues of the bodies of negroes in Guinea, Senegal, Egypt, Arabia, Persia, and India. It is from 1 to 10 feet long and about $\frac{1}{16}$ of an inch wide, and causes painful tumors, blisters, or boils, and sometimes gangrene. *Filaria sanguinis hominis nocturna*, which is about $\frac{1}{16}$ of an inch long, is found in the blood. It is indigenous to Africa, India, China, Australia, and Brazil, and has been found in negroes in our Southern States. "Craw-Craw," a West African skin disease, has been found to be associated with filariasis. In *Filaria loa*, also a West African dis-

ease, the filariae wander through the subcutaneous tissues, especially of the face and eyes, producing inflammation. At least half of the natives of Samoa are said to be affected with filariasis. The parasite is transmitted by mosquitoes, as has been demonstrated by Manson and by Low. In *Culex fastigans* filaria embryos mature rapidly, after the insect has fed on the blood of a patient suffering from filariasis, and the perfect filariae are found in the head, neck, and proboscis of the mosquito. Strong, of the Chief Surgeon's Office, Division of the Philippines, has found filariasis in Iloilo. He believes that the disease will become domesticated in the Southern States, through the return of the American soldiers. This form of filaria is a white, opaline, hairlike worm, tapering towards the ends, which are blunt. It is found only after sundown, appearing in the blood about 6 p.m. A diurnal variety has been discovered by Manson in Congo negroes. The nocturnal variety is found by day in the blood of patients who work by night and sleep by day. Granville advances the theory that the appearance in the blood of this parasite is dependent upon certain conditions of the circulation and of the chyle during sleep. Filariasis is limited between the parallels of lat. 30° N. and 30° S., unless transported by some one infected within the tropical limits. It is found in Brazil, many of the West Indies, in Mexico, and the west coast of South America, the South Sea Islands, Japan, Australia, and China, besides the countries already named as comprising the habitat of the Guinea worm. Parental forms of filaria cause several endemic diseases, including elephantiasis arabum, lymph scrotum, lymph vulva, chyluria, hamatochyluria, and ascites. Consult: Wucherer, in *Gazeta Medica da Bahia* (Brazil, December, 1868); Lewis, in *Medicinisches Centralblatt*, No. 43 (Vienna, 1877); Manson, *The Filaria Nankensis hominis* (London, 1883); and Tropical Diseases (New York, 1907); Daniels, *Tropical Medicine and Hygiene* (ib., 1913).

FILBERT. See HAZELNUT.

FILDES, fildz, SIR LUKE (1844-). An English genre and portrait painter and illustrator, born in Liverpool. He studied in the South Kensington schools and the Royal Academy, made many drawings for the *Cornhill Magazine*, the *London Graphic*, and other periodicals, and illustrated the last work of Charles Dickens—*Edwin Drood*—and of Lever. He exhibited his first oil picture in the Royal Academy in 1872—"Fair, Quiet, and Sweet Rest." Fildes painted a series of large pictures of the life of the English people, such as "Return of the Penitent," "The Widower," and "The Poor of London." He seems peculiarly successful in depicting the hard and sordid experience of the London suffering poor. Well equipped technically, he portrays these scenes and situations with a realism that strongly impresses the beholder and with a great deal of manly sympathy. His vividly colored Venetian street scenes, with their groups of idealized women, such as "Venetian Life," and "An al-fresco Toilette" (1889), are also well known. Later he painted chiefly portraits, including the coronation portraits of King Edward VII and Queen Alexandra and the state portrait of King George (1912). His painting "The Doctor" (1891) is in the Tate Gallery, London. He was elected to the Royal Academy in 1887 and knighted in 1906. Consult his biography by Thomson (London, 1895).

FILE (AS. *feol*, OHG. *fihala*, *fila*, Ger. *Feile*, OChurch Slav. *pila*, file; connected ultimately with Lat. *pingere*, to paint, OChurch Slav. *pisati*, to write, Skt. *piś*, to adorn). A steel instrument with sharp ridges or teeth made by the indentations of a chisel, which is employed for cutting down and shaping metals or other hard substances. Abrading instruments having the general characteristics of files are doubtless very

by a broad-bladed chisel. Files and rasps are distinguished first by their length, which is always measured exclusive of the tang, second by their shape, and third by their cut, which has

DOUBLE CUT COARSE.

ancient. Indeed, the file may be said to be represented in its earliest and crudest form by the rough stones used by prehistoric man in shaping his implements of war and of the chase. Artificially made files are mentioned in the Old Testament in 1 Sam. xiii. 21, and they are also mentioned in the *Odyssey*. These files were doubtless crude in form and very inefficient in operation compared with the modern tool of the same name; but the fact that they were mentioned in these early writings is proof of the consideration in which they were held by the metal workers of ancient times. The file has continued to be one of the most useful of hand tools for working metals and is to-day produced in enormous numbers and with an almost endless variety of forms and characteristics.

The modern file is a bar or rod of hardened steel having one end forged down to a long slim

reference not only to the character, but also to the relative degrees of coarseness of the teeth. The length of a file is the distance between its heel, or part of the file where the tang begins, and the point or end opposite. In general the length of files bears no fixed proportion either to their width or their thickness, even though they be of the same general shape or kind. By kind, in speaking of files, is meant the varied shapes or styles of files which are distinguished by certain technical names, as, e.g., flat, mill, and half-round. The various kinds of files are grouped according to the shape of their cross section into rectangular sections, circular sections, triangular sections, and miscellaneous

CROSS SECTIONS OF TYPICAL FILES.

point or tang for insertion in a wooden handle, and the remainder of its length covered on one or all sides with serrations or teeth. A *rasp* is a species of file in which each tooth is an angular pit with a strong burr formed by a pointed punch, instead of a long furrow formed

sections. These sections are in turn subdivided, according to their general contour or outline, into taper and blunt. The term "taper" designates a file the point of which is more or less reduced in size, both in width and thickness, by

a gradually narrowing section extending from one-half to two-thirds the length of the file from the point. The term "blunt" designates a file that preserves its sectional shape throughout from point to tang. The cut of files is divided, with reference to the character of the teeth, into single cut, double cut, and rasp cut, and with reference to the coarseness of the teeth into rough, coarse, bastard, second cut, smooth, and dead smooth. The accompanying illustrations show all of these cuts. The rough-cut file is one in which a single unbroken course of chisel cuts is made across its surface, arranged parallel to each other, but oblique to the centre line or axis of the file. The double-cut file has two courses of chisel cuts crossing each other, the second course with rare exceptions being finer than the first. Rasp-cut differs from single or double cut in the respect that the teeth are disconnected from each other, each tooth being made by a single-pointed tool called a punch.

File teeth of any of the cuts described may be arranged so as to be spaced equidistant, or they may be arranged so that the spacing varies at different points of the file. When the latter arrangement is used, the files are designated as increment cut. The arrangement of the teeth in increment cut may be described as follows: 1. The rows of teeth are spaced progressively wider, from the point towards the middle of the file, by regular increments of spacing. 2. This general law of spacing is modified by introducing, as the teeth are cut, an element of controllable irregularity of spacing, which irregularity is confined within maximum and minimum limits, but is not a regular increment or decrement. 3. The teeth are so arranged that the successive rows shall not be exactly parallel, but cut slightly angularly with respect to each other, the angle or inclination being reversed during the operation of cutting as necessity requires.

The usual different sectional shapes of commercial files are shown in the accompanying illustration. In length such files range from 3 inches to 20 inches. Smaller files for jewelers, die sinkers, and watchmakers, and needle files are made of special material and in various special sizes. As indicating the small sizes in which files are produced, it may be noted that the smallest size of Nicholson round broach file is but 0.033 of an inch in diameter, and about 1 inch long.

Manufacture. Formerly, all files were hand-made, the steel bar being forged to shape, ground smooth, and cut by hand tools. Most files are now made by machinery designed to perform all of these essential operations. The old method of hand cutting has a peculiar interest because of the deftness and skill required of the workman, and it will be described briefly for this reason, and also because it will help to explain the nature of the work required of modern file-cutting machinery. The following description is taken from Holtzapfel's *Turning and Mechanical Manipulation*:

"The first cut is made at the point of the file; the chisel is held in the hand at a horizontal angle of about 55° with the central line of the file, . . . and with a vertical inclination of about 12° to 14° from the perpendicular. . . . The blow of the hammer upon the chisel causes the latter to indent and slightly to drive forward the steel, thereby throwing up a trifling ridge or bur; the chisel is immediately replaced on the blank and slid from the operator, until it en-

counters the ridge previously thrown up, which arrests the chisel or prevents it from slipping farther back and thereby determines the succeeding position of the chisel. The heavier the blow, the greater the ridge, and the greater the distance from the preceding cut at which the chisel is arrested. The chisel, having been placed in its second position, is again struck with the hammer, which is made to give the blows as nearly as possible of uniform strength; and the process is repeated with considerable rapidity and regularity, 60 to 80 cuts being made in one minute, until the entire length of the file has been cut with inclined, parallel, and equidistant ridges, which are collectively denominated the first course. So far as this one face is concerned, the file, if intended to be single cut, would be then ready for hardening. Most files, however, are double cut; that is, they have two series or courses of chisel cuts. In cutting the second course, the chisel is inclined vertically as before, at about 12°, but its edge only a few degrees from the transverse line of the file, or about 5° to 10° from the rectangle. The blows are now given a little less strongly, so as barely to penetrate to the bottom of the first cuts, and from the blows being lighter they throw up smaller burs, consequently the second course of cuts is somewhat finer than the first. The two series, or courses, fill the surface of the file with teeth, which are inclined towards the point of the file."

At first sight it would appear from the simplicity and continual repetition of the movements required in file cutting that it was an operation especially adapted to be performed by machinery. Nevertheless, it was not until many years after the first inventor of a file-cutting machine had patented his device that file-cutting machines were successfully used, and that machine-cut files could compete with the hand-made product in the market. Among the notable inventors of file-cutting machines may be mentioned Duvesger (1699), Pardonet (1725), Thiout (1740), Brachal and Gamin (1765-78), Raoul (1800), Ericsson (1830), Robinson (1843), and Winton (1847). None of these machines was commercially successful. In 1805, however, Mr. W. T. Nicholson, of Providence, R. I., invented a file-cutting machine, which, as improved and modified from time to time, is now extensively used in the United States. About the same time M. Bernot, a Frenchman, devised a machine which proved commercially successful. Briefly described, the successful forms of file-cutting machines consist of a moving table on which the file blank is fixed, and which moves it progressively under a sort of trip-hammer arrangement carrying cutting chisels. In making machine-made files the bars of steel are first forged by hand or by machines and then ground smooth. The smoothed blank is then run through the cutting machine. The final process is to temper and harden the cut file.

Filing. To the uninitiated this may seem a simple operation of rubbing one piece of metal upon another, requiring only muscular strength and no skill. This is far from being the case, for a skillful workman will in a given time, with a given amount of muscular work, cut away a far greater quantity of metal with a file than one who is unskillful, for he makes every tooth cut into the work, instead of rubbing over it. To do this, he must adapt the pressure and

velocity of motion of the file to the coarseness of its teeth and the hardness, brittleness, and toughness of the material he is working upon. To *file flat*—i.e., to avoid rounding the sharp edges of a narrow piece of work—is very difficult, and some years of continual practice is required before an apprentice can do this well, especially in "smoothing up" or finishing work before polishing, and there are some who never succeed in filing, smoothing, and polishing without rounding the edges of fine work. The power to do this constitutes the main test of skill among mathematical-instrument makers and other metal workers. The flattest surface can be obtained by laying the work, where its form admits, upon a piece of cork held in the vise, and filing it with *one hand*; the pressure on the file being communicated by the forefinger. It is mainly to aid the workman in filing flat that the rounded or bellied form is given to files; this partially compensates the tendency of the hands to move in a curved line with its convexity upward when they move forward, and apply pressure, as in the act of filing. In *draw filing* the file is held in the fingers of both hands and moved so that the ridges of the teeth are nearly parallel to the direction of motion. This makes a long shearing cut along the surface filed, and no tooth marks are left.

FILEFISH. One of a family (Monacanthidae) of small tropical and semitropical fishes closely related to the plectognath trigger fishes (q.v.). The scales are very small and rough, giving the skin a velvety appearance and making it serviceable as a polishing material. The name refers to the filelike appearance of the stout dorsal spine, which is rough and armed behind with two rows of barbs. The type genus *Monacanthus* contains several species, but the best-known filefish is the "barnacle eater" (*Aluterus schoepfi*), which ranges northward to New England, may be 18 inches long, and has a "bright skin sometimes of an orange and sometimes of a tawny hue." It is a favorite object in aquariums. The habits of

DEVELOPMENT OF FILEFISH.
Palatal and profile view of the teeth.

the group are much the same as those of the trigger fishes (q.v.). See Plate of PLECTOGNATH FISHES.

FILILEFO, fē-lē'fō (Lat. *philelphus*), FRANCESCO (1398-1481). An Italian humanist, born at Tolentino. He studied at Padua, and in 1417 was called to teach moral philosophy and eloquence at Venice. There he became distinguished as an expositor of the works of Vergil and Cicero, which then constituted the principal textbooks in his subjects. In 1419 he was ap-

pointed secretary to the Venetian Consul at Constantinople, where he acquired an excellent knowledge of the Greek language and a valuable collection of Greek manuscripts. From 1427 he taught Latin and Greek at Bologna, Florence, and Siena, and from 1440 at Milan, where he was also attached to the court of the Duke, Filippo Visconti, as poet and orator. He wrote for the next Duke, Francesco Sforza, 12,800 lines of an epic known as the *Sforziad*. In 1475 he went to Rome, and in 1481 accepted the chair of Greek at Florence. He was neither a profound nor an accurate scholar, and his arrogance made him personally unpopular, but his energy did much to further the spirit of learning inspired by Petrarch. Consult Rosmini, *Vita di Filelfo* (Milan, 1808), and Symonds, *The Renaissance in Italy* (London, 1877).

FILE SHELL. A pholad. See PHOLAS.

FILIA'TION (from Lat. *filius*, son). In English and American law, a proceeding instituted for the judicial determination of the paternity of a person. It may be employed for the purpose of establishing legitimacy with reference to inheritance, or to determine the paternity of a bastard, in order to charge upon the father the support of his illegitimate offspring. In the United States the term is more commonly employed in the latter sense, as in the expression "filiation proceedings," for bastardy proceedings. See BASTARD; LEGITIMACY; PARENT AND CHILD.

FILIBUS'TERS (Sp. *filibustero*; from Fr. *filibustier*, *fribustier*, from Dutch *vrijbouter*, *vrijbouter*, freebooter, from *vrij*, free + *bouter*, from *boete*, Eng. *boot*, profit). The name once applied to a class of piratical adventurers in the West Indies during the seventeenth century (see BUC-CANEERS), but now generally used to designate any group or association of men who in disregard of international law forcibly intervene as private individuals in the affairs of any foreign state with which their own government is at the time on terms of peace. In American history the term is applied specifically to those citizens of the United States, or residents therein, who at various times in the nineteenth century intervened in the affairs of the West Indies or of Central or South America for the purpose of freeing colonies from Spanish domination or independent states from misgovernment, frequently with an underlying motive of securing the annexation of additional territory to the United States, and in many cases of extending the area of slavery and thus augmenting the influence of the "slave power" in governmental affairs. Aaron Burr planned to lead a great filibustering expedition into Mexico and Central America in 1806-07, and the independence of Texas, in 1836, was brought about in part by filibusters from the United States; but the most famous expeditions in American history were those of Lopez and Walker. Lopez, after making several fruitless attempts in 1850-51 to effect the liberation of Cuba, was finally, on Aug. 16, 1851, defeated, captured, and executed. Walker succeeded (1855) in overturning the government of Nicaragua, but quarreled with the native leaders and in 1857 was brought back to the United States by an American naval officer, to whom he had surrendered. He subsequently (1857-60) organized three more expeditions, each of which failed, and in September, 1860, was routed by the President of Honduras and summarily executed. (See LOPEZ, NARCISO; WALKER, WILLIAM.)

Minor expeditions were sent from the United States to Cuba during the years 1868-98, but they accomplished little and attracted relatively little attention, though much excitement was caused in 1873 by the brutal execution at Santiago, Cuba, of a number of Americans, mostly filibusters, found by the Spanish authorities aboard the captured steamer *Virginius*. Consult Roche, *Byways of War: The Story of the Filibusters* (Boston, 1901). See VIRGINIUS MAS-SACRE, THE.

FILICAJA, fē'lē-kā'yā, VINCENZO DA (1642-1707). An Italian lyric poet, born in Florence. He was a member of the Arcadia and Crusca academies and was patronized by Christine of Sweden, who educated his children, and by the Grand Duke of Florence, who made him senator and later Governor at Volterra and Pisa. Of his numerous poems (*Poesie Toscane*, Florence, 1707) the most famous are those on the Turkish wars (1683) and the sonnets to Italy. The conflicting estimates of his work are explained by the fact that he had great emotions and a vivid imagination which he obscured under the exaggerated artificiality of the academic style of his time, of which he remains one of the most brilliant cultivators. Consult Amico, *Poesie o lettere di Vincenzo Filicaja* (Florence, 1864), and G. Caponi, *Vincenzo da Filicaja e le sue opere* (Prato, 1901).

FILICALES, fil'ī-kā'lez. See FERN.

FILIGREE (formerly *filigraine*, *filigrune*, Fr. *filigrana*, from Lat. *filum*, thread + *granum*, grain; the old filigree work being a combination of these two elements). The name applied to delicate wirework, ornaments, usually of gold or silver wire, twisted and plaited into spirals and other convoluted forms, combined to form a sort of metallic lacework, and joined at their points of contact by gold or silver solder and borax, by the help of the blowpipe. Small grains or beads of the same metals are often set in the eyes of volutes on the junctions, or at the intervals, at which they will effectively set off the wirework; in early Greek work the gold ground was covered with infinitesimal gold grains. The more delicate tracery is usually set in a framework of stouter wire. It is used for brooches, earrings, crosses, head ornaments, jewel caskets, and like objects of a light and elegant character. This work is now chiefly done in Malta, India, Genoa, some Tuscan villages, the Ionian Islands, and some parts of Turkey.

The technique of filigree was not unknown to Egyptian jewelers, but it was perfected by Greek art, to which belong the examples found in Italian tombs, wrongly called Etruscan. The Greek filigree work of the golden age of the fifth and fourth centuries B.C. is of extraordinary beauty. The delicate frosting of the solid surface, produced by the sprinkling of fine gold grains, which is an essential part of perfect filigree work, appeared to be a lost process after the decline of Greek art, but was revived by the famous Roman collector, Castellani, who executed many beautiful copies. The firm of Tiffany has more recently carried its excellence still further. Necklaces, tiaras, hairpins, safety pins, earrings, rings, bracelets, are the principal classes of personal jewelry in the original Greek works. The Vatican, Louvre, and Metropolitan museums have the greatest quantity of works found in Italian tombs, while the British Museum has a large number discovered in Greek

lands. The latest Greco-barbaric forms are best shown in specimens from southern Russia, at St. Petersburg and Kertch.

From the Roman period to modern times that part of the technique was most popular which consisted of the use of wirework. But the secret of frosting with gold grains was not lost, only the fashions had changed. In many collections of early mediæval jewel work there are reliquaries, covers for the Gospels, etc., made either in Constantinople from the sixth to the twelfth century or in monasteries in Europe, in which Byzantine goldsmiths' work was studied and imitated. These objects—though not entirely in filigree work—besides being enriched with polished but uncut precious stones and with enamel, are often decorated with filigree, soldered on to large surfaces of gold; and corner pieces of book covers or the panels of reliquaries are not infrequently made up of complicated pieces of plaited work, alternating with spaces incrustated with enamel. Byzantine filigree work occasionally has small stones set among the curves or knots. In the north of Europe the Goths, Saxons, Britons, and Celts were from an early period skillful in several kinds of goldsmiths' work. Brooches, and other personal ornaments in England, were incrustated with enamel work varied with borders or centres of filigree. The Irish filigree work is especially varied in design and reached its highest perfection in the tenth and eleventh centuries. The Royal Irish Academy in Dublin contains a number of such reliquaries and personal jewels, of which filigree is the general and most remarkable ornament, varied by numerous designs, in which one thread can be traced through curious knots and complications, which, disposed over large surface, balance one another, but always with special varieties and arrangements difficult to trace with the eye. The long threads appear and disappear without breach of continuity, the two ends generally worked into the head and tail of a serpent or a monster. The reliquary containing the "bell of St. Patrick" is covered with knotted work in many varieties. A two-handled chalice, called the 'Ardagh cup,' has belts, bosses at the junctions of the handles, and the whole lining of the foot ornamented with work of this kind of extraordinary fineness. Much of the later mediæval jewel work all over Europe down to the fifteenth century, on reliquaries, crosses, crosses, and other ecclesiastical goldsmiths' work, is set off with bosses and borders of filigree. Mohammedan damascene work must be carefully distinguished, but filigree work in silver was practiced by the Moors of Spain during the Middle Ages with great skill and was introduced by them and established all over the peninsula, where silver filigree jewelry of delicate and artistic design is still made in considerable quantities. The manufacture spread over the Balearic Islands and among the populations that border the Mediterranean and continues all over Italy and in Albania, the Ionian Islands, and many other parts of Greece. That of the Greeks is sometimes on a large scale, with several thicknesses of wire alternating with larger and smaller bosses and beads, sometimes set with turquoises, etc., and mounted on convex plates, making rich ornamental headpieces, belts, and breast ornaments. Filigree silver buttons of wirework and small bosses are worn by the peasants in most of the countries that produce this kind of jewelry. Silver filigree brooches and buttons are made also in Denmark, Norway, and

Sweden. Little chains and pendants are added to much of this northern work. Beautiful specimens have been contributed to the various international exhibitions. Considerable filigree work in silver is produced by Armenian jewelers in Constantinople and Asiatic Turkey. Some very curious filigree was brought from Abyssinia after the capture of Magdala in 1870—arm guards, slippers, cups, etc. They are made of thin plates of silver, over which the wirework is soldered. The filigree is subdivided by narrow borders of simple pattern, and the intervening spaces are made up of many patterns, some with grains set at intervals. The Indian workmen retain many Greek patterns, and work them in the same way, down to the present day. Wandering workmen are given so much gold, coined or rough, which is weighed, heated in a pan of charcoal, beaten into wire, and then worked in the courtyard or veranda of the employer's house, according to the designs of the artist. The completed work is weighed on its restoration and the workman is paid at a specified rate for his labor. Very fine grains of gold are still used. This work requires the utmost delicacy of hand and is of extraordinary richness of effect. Great interest has been felt in the revival of the designs of antique jewelry by Signor Castellani. He collected examples of the peasant jewelry still made in many provinces of Italy on extraordinary designs preserved from a remote antiquity. Most of the decoration is in filigree of many varieties. It was in part through the help of workmen in remote villages, who retained the use of various kinds of solder, long forgotten elsewhere, that the fine reproductions of antique gold filigree have been so beautifully executed in Italy and by Italian jewelers. Consult the authorities referred to under JEWELRY.

FILINTO, fê-lên'tô, ELYSIO. See NASCIMENTO, MANOEL DE.

FILIOQUE. A Latin phrase meaning "and from the Son," which was added to the Nicene Creed by the Western church and has formed a prolific source of controversy between the Greek and Roman Catholic churches. According to the received Greek text, this article of the creed runs thus: "And we believe in the Holy Ghost, . . . who proceedeth from the Father." This was the form common to all sections of the Church in the fifth century. At the Third Synod of Toledo (589 A.D.), the Spanish bishops used a Latin version which contained the *filioque* addition, thus: "I believe in the Holy Ghost, . . . who proceedeth from the Father and the Son." This addition met with favor in the Western church, especially in Spain, after the conversion of the Goths, but was very offensive to the East. Passages could be cited from the writings of Augustine and Leo the Great in support of the doctrine of the "double procession," as it is technically called, but its formulation as part of the creed was destitute of ecclesiastical authority. The early ecumenical councils had omitted any expression of the double procession, and the symbol which expressed this faith had been pronounced unalterable. Nevertheless the Western church contended, first, for the truth of the doctrine implied in the *filioque*, and, later, for the symbolic authority of the clause itself.

The Synod of Gentilly (767) approved the clause, and in 809 Charlemagne convened a synod at Aix-la-Chapelle to examine the whole question of the proper wording of this clause. The decision was in favor of the form sanctioned at

Toledo; but, the case coming before Pope Leo III, he discreetly refrained from giving his approval to the change in the creed, though he admitted the truth contained in the doctrine as a proposition of theology. The earliest formal recognition of the *filioque* by a pope was in 1014, when Benedict VIII permitted its use at the coronation of Henry II. By the middle of the eleventh century it had become well established in Rome. Meanwhile the break between the Eastern and the Western church had come. Photius, Patriarch of Constantinople, had charged Rome with violating the canons by allowing a change to be made in the creed, and this, together with other causes which need not be specified here (see GREEK CHURCH), brought about the great schism. Frequent efforts have since been made to heal this breach, but without success. Even the most hopeful attempts of Greek and Roman Catholics to reach some agreement on the *filioque* question, e.g., at the councils of Lyons (1274), and especially of Ferrara-Florence (1438-39), have accomplished no permanent result. That the Eastern church has persistently refused to admit the validity of the Roman contention may be seen from such official pronouncements as the *Orthodox Confession of the Eastern Church* (1643) and the *Larger Catechism of the Orthodox Eastern (Russian) Church* (1839). The great Greek theologian and doctor, John of Damascus, went to the limits of Eastern orthodoxy when he said, "The Holy Ghost proceeds from the Father through the Son." It is worthy of note that these words formed the basis of doctrinal agreement on this creed article reached at a conference of Old Catholic, Greek, and Anglican divines in Bonn in 1875, but no practical result followed their deliberations. Consult: F. S. Ffoulkes, *Historical Account of the Addition of the Word Filioque to the Creed* (London, 1867); Hefele, *History of the Councils*, vol. iii (Eng. trans., ib., 1883); Schaff, *Creeds of Christendom*, vol. ii (New York, 1890); Har-nack, *History of Dogma*, vol. v (Boston, 1890).

FILIPINO, fil'i-pê'nô. See PHILIPPINES.

FILIPPI, fê-lép'pê, FILIPPO DE (1814-67). An Italian traveler and naturalist. He was born at Milan and, after holding professorships in zoölogy at Pavia and Turin, made a tour to Persia in 1802, which is described in his *Note di un viaggio in Persia* (1865). He was director of the zoölogical exploring expedition sent out in the *Magenta* to circumnavigate the globe, but died on reaching Hongkong. He was the author of the important work entitled *Delle funzioni riproduttive negli animali* (2d ed., 1856) and various books on travel.

FILIPPI, fê-lép'pê, FILIPPO DE (1869-). An Italian physician, alpinist, explorer, and historiographer. He was born in Turin in April, 1869. As a member of the Italian Alpine Club he had made numerous ascents in the Alps, when (in 1897) he was invited to join the Duke of the Abruzzi's expedition to Alaska, which accomplished the first ascent of Mount St. Elias. The history of the expedition he later prepared. In 1906 he accompanied the Duke to Africa in his exploration of Ruwenzori (probably "Mountains of the Moon" of Ptolemy) and in 1911 went to Kashmir to attempt the ascent of "K2" (Godwin Austen). The elaborate volumes narrating these expeditions, as also the story of the Arctic voyage of the *Stella Polare*, on which the farthest north of the period was attained by the Abruzzi expedition, were

also prepared by him. In 1913 he organized an expedition for a geological and physical study of an unvisited portion of the Karakoram Himalayas (Kashmir), in which he was engaged during the next year.

FILITE. See EXPLOSIVES.

FILIX-MAS. See FERN, MALE.

FILLAN, *fil'an*, or **FAELAN**, SAINT. TWO Irish or Scottish saints, whose histories are more or less legendary. 1. St. FILLAN, or Faolan, the leper, was commemorated by a church in Scotland at the east end of Loch Erne in Perthshire, where "St. Fillan's well" was long believed to have supernatural power of healing. He also had a church in Ireland at Ballyheyland (anciently called Killhelan, or Kill Faelain), in the barony of Cullenagh, Queen's County. His day was June 20. 2. St. FILLAN, the abbot, lived in the eighth century. He was a native of Ireland, became a monk there, and went to Scotland, where he seems to have lived at Strathfillan in Perthshire. His chief church was there, and also a well-endowed priory dedicated to him. His day is January 9. The silver head of his crosier, or pastoral staff—called the "coygerach" or "quig-rich"—appears in record as early as 1428 and, after a curious history, is now preserved in the museum of the Society of Antiquaries of Scotland at Edinburgh. A hand bell which bore his name and was believed to work miracles is also in the same museum. Consult: Wilson, *The Quigrich or Crosier of Saint Fillan* (Toronto, 1859); also "Historical Notices of Saint Fillan's Crosier," by Dr. Stuart, reprinted from the *Proceedings of the Society of Antiquaries of Scotland*, vol. xii (1878); Forbes, *Kalendars of Scottish Saints* (Edinburgh, 1872).

FILLE DU RÉGIMENT, *du rā'zhé'mi'n*, LA (Fr., The Daughter of the Regiment). An opera by Donizetti (q.v.), first produced in Paris, Feb. 11, 1840, in the United States in 1843 (New York).

FILLET (OF. *fillet*, ML. *filletum*, small thread, dim. of Lat. *filum*, thread). In architecture, a narrow flat surface or square edge in the profiles of moldings. In heraldry (q.v.), a charge. In Greek and Roman religious rites, a white and red band of woolen stuff, worn upon the forehead, as a sign of religious consecration and of inviolability. It was used by the priests and hence is spoken of usually as a sacred fillet. It appears in carved ornament in the fluttering ribbons associated with festoons (see FESTOON), both in antique and Renaissance art.

FILLEY, (HAUNCEY IVEY (1829-). An American merchant and politician, born in Lansingburg, N. Y. He became the largest importer and distributor of queensware in the Mississippi valley. He was mayor of St. Louis in 1863-65 and in 1865 a member of the State Constitutional Convention which abolished slavery in Missouri. He was a member of the Republican National Convention in 1864 and thereafter of every State and national convention up to and including 1896, and also served as a member of the Republican National Committee from 1876 to 1892. He was postmaster of St. Louis in 1873-78 and president of the St. Louis Board of Trade in 1876-79. He published *Some Republican History of Missouri, 1856-1898* (1898).

FILMORE, MILLARD (1800-74). The thirteenth President of the United States. He was born in Cayuga Co., N. Y., Feb. 7, 1800. After a youth of industry with little opportunity for education, he undertook the study of law, and

was admitted to the bar in 1823. His practice of his profession, chiefly at Buffalo, continued actively for 24 years. His political life began in 1828 with his election as an Antimason (see ANTIMASON) to the State Legislature, where he served for three terms. In 1832 he was elected to Congress as a Whig and retained his seat, with one intermission (1835-37), until 1843. During this period he was prominent as a debater on the Whig side, upheld the right of petition, served as chairman of the Committee on Ways and Means in the Twenty-seventh Congress, and reported the Tariff Act of 1842, of which he was virtually the author. He sought without success the presidential nomination in 1844, and in the same year he ran for Governor of New York on the Whig ticket, but was defeated by Silas Wright (q.v.). He became Comptroller of New York State in 1847. In the following year he was elected by the Whig party Vice President on the ticket with Zachary Taylor (q.v.). Upon the death of the President, in July, 1850, Fillmore succeeded him, and the change in administration was marked by the early passage of the Compromise Measures. (See COMPROMISE MEASURES OF 1850.) Fillmore's support of those measures and especially his signing of the Fugitive Slave Law (q.v.) alienated many of the extreme Northern members of his party. Aside from the development of the slavery problem, his administration was marked by one conspicuous event—the establishment of diplomatic relations with Japan. In 1852 he was a prominent presidential candidate before the National Convention of the Whig party. In 1856 he was a candidate for the presidency on the ticket of the Know-Nothing (q.v.), or American, party, and, although supported by many conservative Whigs, such as Edward Everett (q.v.), he received the electoral votes of only one State (Maryland). He took no active part in the Civil War, and spent the remaining years of his life at Buffalo, where he died March 8, 1874.

Though devoid of many advantages in his youth, Fillmore acquired a dignity and urbanity which made him greatly respected while President. Consult: Chamberlain, *Biography of Millard Fillmore* (Buffalo, 1856); Stoddard, *Millard Fillmore* (New York, 1888); Wilson, *The Presidents of the United States* (ib., 1894); Stanwood, *A History of the Presidency* (last ed., Boston, 1898); J. F. Rhodes, *A History of the United States from the Compromise of 1850*, vol. i (New York, 1903); McClure, *Our Presidents* (3d ed., ib., 1905). For an account of his administration, see UNITED STATES.

FILMER, SIR ROBERT (?-1653). An English political writer, defender of the divine right of kings. He was educated at Trinity College, Cambridge, was knighted by Charles I, and was active as a Royalist during the Civil War. His most important work is his posthumous *Patriarcha; or, The Natural Power of Kings* (1680), which attempts to trace kingly right by primogeniture back to Noah and to Adam. The book was reckoned a classic defense of divine right and was answered by Algernon Sidney, in his posthumously published *Discourses Concerning Government* (1698), and by Locke, in his *Two Treatises of Government: In the Former, the False Principles and Foundation of Sir R. Filmer and his Followers are Detected and Overthrown, etc.* (1690). Filmer also wrote: *The Anarchy of a Limited and Mixed Monarchy* (1648); *The Power of Kings, and Particularly of the King of*

England (1680); *The Freeholder's Grand Inquest Touching our Sovereign Lord the King and his Parliament* (1648); *Observations Concerning the Original of Government* (1652), attacking Hobbes, Milton, and Hugo Grotius; *Observations on Aristotle's Politiques Touching Forms of Government* (1652); *Advertisement to the Jurymen of England Touching Witches, together with the Difference between a Hebrew and an English Witch* (1653).

FILOCOPO, fê-lô-kô'pô, IL. A prose version by Boccaccio, written at Naples about 1340, of the old French metrical romance *Flore et Blanchefleur*.

FILON, fê'lôn', CHARLES AUGUSTE DESIRÉ (1800-75). A French historian, born in Paris. He was the author of many valuable works, which include: *Histoire comparée de France et d'Angleterre* (1832); *Histoire de l'Europe au XVIIIème siècle* (2 vols., 1838); *Histoire de la démocratie athénienne* (1854).—His son, PIERRE MARIE AUGUSTIN (1841-), was the tutor of the Prince Imperial from 1867 to 1870. He wrote several histories, novels, and critical reviews, such as *Guy Paton, sa vie, sa correspondance* (1862); *Histoire de la littérature anglaise* (1883), crowned by the Academy; *Prosper Mérimée* (1894); *Le théâtre anglais* (1896); *De Dumas à Rostand* (1898); *La caricature en Angleterre* (1902).

FILOSTRATO, fê-lôs'trà-tô, IL. A narrative in poetic form by Boccaccio (1341), closely followed by Chaucer in *Troilus and Criseida*.

FILTER AND FILTRATION (Fr. *filtre*, doublet of Fr. *OF. feutre*, It. *feltro*, felt, from OHG. *filz*, Ger. *Filz*, AS., Eng. felt; connected with OHG. *falsz*, Ger. *Falsz*, fold, Lat. *pellere*, to drive). The original and oftentimes the sole object of filtration is the removal of suspended matter from liquids by the mechanical process of straining. Recently science has shown that in some of its applications filtration is far more than a straining process, particularly in water and sewage purification, where, by the agency of bacteria, organic matter, both in solution and suspension, is removed or transformed, thus preventing or delaying the clogging of the filter by the latter. The end to be attained in filtration may be the securing or the recovery of matter suspended in a liquid, or the clarification or other purification of the liquid itself. The filter may be either a vessel of porous material, such as carbon in some form of baked clay, unglazed porcelain, or fine-grained sandstone, or it may be a vessel containing a granular or fibrous material, supported on a perforated bottom. Granular filtering materials may be sand, crushed quartz, powdered or crushed glass, bone or wood charcoal, crushed coke or cinders, or other substances more or less similar. Fibrous filtering material may be cotton, wool, or asbestos, either in the form of cloths or otherwise, and like substances. Both experience and theory show that in many instances the material to be filtered out adheres to the surface of the individual grains or fibres of the filtering material, often forming a layer or membrane on the surface of the walls of filter vessels. In such cases adsorption assists in the process, and the reduction of the size of the pores of the filtering medium, whether through straining or adhesion, makes it more difficult for the suspended matters to pass through. Another contributing cause is the tortuous passage through the filtering material, the several particles of the latter

serving as so many dams or barriers to the progress of the suspended matters, adsorption again aiding in this process. The speed or capacity of filters, and also their efficiency or thoroughness, may be aided in some cases by the use of a coagulant, which serves to bring the suspended matters together in flakes or clots which are readily retained by the filtering material. The burden upon filters, or their tendency to clog, may be lessened in some cases by previous sedimentation. When filters deteriorate so that they give a filtrate deficient in quality or quantity, they may be either discarded or cleaned, according to their nature. Sometimes they may be washed by reversing the flow of liquid through them. See SEWAGE DISPOSAL; WATER PURIFICATION.

FILTER PRESSES. A combination of strainers or filters with some form of press designed to hasten the process or increase the thoroughness of separating liquids and solids. In many cases the filtering is nominal only, the filter cloth being used chiefly to retain the solid matter, which otherwise would be squeezed out between the plates or racks of the press. The force used in pressing may be applied by hand, steam, or other power, by means of simple screws or more or less complicated gearing, or air pressure may be used. Common examples of the former are the ordinary cheese and cider presses, and tankage presses used in garbage and fat-rendering establishments. Compressed air is sometimes used both to fill and operate presses dealing with matter having a high percentage of water, like sewage sludge. (See SEWAGE DISPOSAL.) Hydraulic power may also be used to operate filter presses.

FILTH DISEASE. A term that may be applied to any disease caused or supported by accumulation of filth. The term, although useful, is not strictly scientific. It has been applied to typhoid fever, cholera, dysentery, and diarrhoea, as well as to erysipelas, pyæmia, septicæmia, and puerperal fever. These were called "filth diseases" on the supposition that they were caused by putrefying excrement, garbage and refuse, leakage and seepage from cesspools, privy vaults, and sewers, through which wells and springs, as well as the atmosphere, became polluted. Since the discovery that the causative principle in each of these diseases is a specific bacillus, the term "filth disease" has fallen into partial disuse. It is known that bacteria do not pass through the air accompanying the vapor arising from a fluid, and that, in general, gases and vapors cannot convey infection, bacteria being carried by spray or dust. Yet it is true that allowing filth, particularly human excrement, to accumulate so that it may gain access to drinking water, or may attract insects which will carry it about, is to invite contamination and infection by the bacteria that may exist in such filth. Thus, flies may carry fecal matter about and transfer it to food. Typhoid fever is spread through the medium of water or milk or other food which has been infected by the excrement of patients suffering with the disease. Want of personal cleanliness may encourage disease, and an accumulation of refuse affords a nidus for the multiplication of pathogenic germs. It is therefore clear that preventing the accumulation of filth must in a large measure serve also to prevent filth diseases. See INSECTS, PROPAGATION OF DISEASES BY; TYPHOID FEVER.

FILTRATION. See FILTER AND FILTRATION. **FILUM AQUÆ** (Lat., thread of the stream).

In law, the imaginary line running along the centre of a natural stream, which is the presumptive boundary between the lands on the opposing shores. When one conveys lands bounded by a watercourse, he is presumed, if the stream is private and the bed of it is vested in the grantor, to convey to the centre or thread of the stream. This presumption may be rebutted by a plain expression of a contrary intention in the deed, or the whole of the stream may be granted with the land on either side. But where, as is usually the case, a stream is taken as the boundary without special restriction, it is the thread, or *filum aquæ*, which is understood as the line between the riparian owners. This thread has no reference to the position of the channel, nor does its location necessarily follow the flow of the water; but it is, as a general thing, a line midway between the banks and following the contour of the shore as nearly as possible. The principle of the *filum aquæ* finds its most frequent illustration in the case of riparian proprietors in private streams, but it is equally applicable to the delimitation of frontiers between opposing states or nations or of minor political divisions. See RIPARIAN RIGHTS.

FIMBRIA, CAIUS FLAVIUS (?-84 B.C.). A Roman soldier and partisan of Marius during the civil war with Sulla. As legate to the consul Valerius Flaccus at Chalcædon, he stirred up mutiny among the troops, who murdered their consul and took Fimbria as their leader. Fimbria undertook a campaign against Mithridates, whose general, Archelaus, had invaded Greece. When in 85 B.C. Sulla, after the defeat of Archelaus, made peace with Mithridates, he turned his arms against Fimbria, who, finding himself deserted by his troops, put an end to his life (84).

Fimbria was noted for the cruelty of his treatment of the enemies of the Roman arms, and it is related of him that, having by a ruse obtained entry to Ilium, he burnt the town, which Sulla afterward caused to be rebuilt.

FIMBRIATED (Lat. *fimbriatus*, fringed, from *fimbria*, border, fringe). A term in heraldry, applied to an ordinary having a narrow border or edging of another tincture.

FIN (AS. *finn*; connected with Lat. *pinna*, fin). An organ possessed by aquatic animals and used for locomotion in the water.

General Considerations. Fins are cutaneous folds which may or may not be supported by fin rays or other framework. In the squid the fins are cutaneous lobes; in pleuropods they are morphologically paired parts of the foot. Folds of skin occur on the tails of certain adult and larval Amphibia. The forelegs, or "flippers," of marine turtles and cetaceans are modified into finlike organs, besides which the tail of cetaceans ends in a fin, and a fatty dorsal fin may also be present. The fins of both turtles and cetaceans are supported by a bony framework.

Fins of Fishes. Fishes' fins may consist of mere folds of the skin, or these membranous folds may be supported by cartilaginous or bony rods, the fin rays. When the supporting rays are unsegmented, in which case they are usually strong, we have a spiny-rayed fin like the first dorsal of the perch; the whole or a part of a given fin may be spiny-rayed. Such fishes are classed as "acanthopterus." When the rays

are segmented, we have soft-rayed fins, and the fishes possessing only such are classed as "malacopterus." Fins arise as folds of the skin. In young fishes these folds are much more extensive and later disappear, except in the region where the permanent fins are to develop. For the wholly different fins of certain ancient fishes, and the few existing lung fishes, see DIPNOR.

Fins are of two kinds—paired and unpaired. The paired fins, placed at or near the ventral side of the body, are the pectoral and anal, corresponding to the anterior and posterior limbs respectively of higher vertebrates. Along the median dorsal line we may have one or more unpaired fins—the dorsal fins. The caudal fin terminates the body posteriorly. The anal fin (usually one, but sometimes several) is the unpaired fin in the median ventral line of the body, posterior to the anus. In flounders and in certain fish embryos there is a continuous dorsal and ventral fold of skin supported by fin rays. In most adult fishes only isolated patches of the continuous fin remain—two dorsal, one ventral, and one caudal. See illustrations under FISH.

FIN STRUCTURE.

Diagram showing the relation of the fin bones (rays) of the dorsal fin of a teleost fish to the underlying flesh and spinal column.

Fins may be variously modified. The pectorals may be greatly broadened and lengthened and act as flying organs, as in the flying fishes. The ventral fins may be entirely absent, as in the Apodes. They may be united in a manner to produce a sucking disk, as in the lumpsucker, or the dorsal fin may be transformed into a sucking disk, as in the remora. The anals may be entirely wanting, as in certain sharks. The modifications of the caudal fin (tail) fall into two forms, proposed by Agassiz, which are characteristic of groups and much used in the classification of fishes. These forms are:

Homocercal.—A condition where the caudal fin is symmetrical as to the axis of the body: i.e., the lobes are equal, and the spine (then said to be "isocercal") ends at the middle of the base of the fin. The perch and salmon have such tails.

Heterocercal.—A condition where the upward bending of the spine and its extension into the upper lobe cause an evident inequality in the lobes, as in sharks. In this case the spine is said to be "diphycercal."

FINAL CAUSE. See CAUSALITY.

FINALE, *fē-nāl'* (It., end). The name given to that part of a musical composition which finishes the act of an opera; also to the last movement of a cyclical instrumental composition, as in the symphony, quartet, quintet, sonata, etc. The character of the finale in purely instrumental works is generally lively. In the opera it depends on the subject, sometimes being an aria alone, instead of the usual full concerted music for soli and chorus.

FINALE NELL' EMILIA, *nēl'it-mē'lyā*. A city of Modena, north Italy, on the Panaro, 27 miles northeast of Modena (Map: Italy, C 2). It has a trade in cattle and manufactures silk. Pop. (commune), 1901, 12,798; 1911, 13,422.

FINALISM. The view that the world's course as well as its origin is the expression of a plan having an end in view, or of plan-must,

Public Expenditure. It is through the expenditure of public money that the state works in all of its activities, and it is the first duty of the science of finance to determine their nature and scope. Finance accepts public expenditures

as a fact. It is not concerned with justifying them, either in whole or in detail. Whether a given expenditure is proper is in part a question of political philosophy, in part a question of practical expediency. The former may influence general lines of policy in this respect, though in practice each proposed public expenditure is apt to be judged on its own merits. The grounds upon which such proposals are approved or rejected lie outside the domain of finance. But the fact that expenditure is made is of prime importance, and, scrutinizing the expenditures which are actually made, finance seeks, by classifying them, to arrive at the laws of their development.

Classification of Public Expenditures. Formerly economists classified public expenditures as *necessary* and *voluntary*. This classification, based upon a definite theory of the functions of the state—a subject beyond the province of finance—obviously fails to meet the requirements of modern financial theory. A fairly satisfactory classification is that of Prof. Henry C. Adams, who classes public expenditure as protective, commercial, and developmental. The first class includes the preservation of internal peace and the defense of the nation against foreign aggression. In the second class are placed expenditures entailed by the performance of a number of functions in which the state takes the place of the private capitalist, as in the management of enterprises such as the post office, telegraphs, and railways. In the third group, developmental expenditures, are included those which the state undertakes to promote its own interests or those of its inhabitants, such as expenditures for education and other outlays which are designed to improve general conditions among the people. It is not to be understood that the boundaries of these groups can be sharply drawn. Legislative expenses, e.g., fall under all these heads. Such a classification has its value in pointing out that, besides the expenditures for protection which are essential to existence, there are others equally natural and equally unavoidable which are incident to growth and progress. The precise form which the latter take depends on local necessities and historical antecedents.

Growth of Public Expenditures. Whatever may be the theoretical justification of expenditures, however they may be appropriately grouped, finance must take cognizance of the fact that in volume expenditures are growing at a rapid rate. The evidence upon this point is cumulative, but not comprehensive. The division of authority between national and local governments materially enhances the difficulty of ascertaining the aggregate expenditures for all public purposes within a given nation. The distribution of expenditures between the national and local governments differs widely in the various countries; and for this reason it is necessary to exercise great caution in comparing the national expenditures of modern states. For national expenditures the figures are generally available. We borrow from Professor Adams a table giving the national expenditure in millions of dollars for a number of states from 1830 to 1890, to which we have added, from the latest sources, the figures for subsequent decades.

So far as these figures go they show steady advance, though it is by no means uniformly rapid, for the various countries. The significant

cance of this advance in national expenditure can be fully understood only by a detailed study of each of the countries involved. The first consideration is the relation of expenditure to population. For the United States this is shown by the following table, taken from the Report of the Secretary of the Treasury:

YEAR	Total mills. dolls.	Per capita	YEAR	Total mills. dolls.	Per capita
1840 ..	\$24.3	\$1.42	1880....	\$267.6	\$5.34
1845.....	22.9	1.15	1885....	260.2	4.63
1850.....	39.5	1.71	1890....	318.0	5.07
1855.....	59.7	2.19	1895....	356.2	5.10
1860.....	63.1	2.01	1899....	605.1	8.14
1865.....	1297.6	37.34	1900....	487.7	6.39
1870.....	309.6	8.03	1905....	507.0	7.46
1875.....	274.6	6.23	1910 ..	659.7	7.30

(Net expenditure, i.e., all national expenditures except payment of the national debt. In the nomenclature of the Treasury report "net expenditure" includes "net ordinary expenditure" and interest on the public debt.)

These figures show a marked difference between the period which preceded the Civil War and that which followed; they also illustrate the disturbing influence of war on the national finances. Both the earlier and the later period manifest a general tendency towards an advance of expenditure slightly more rapid than that of population. The tendency of expenditures to outrun population is characteristic of most modern states. Thus, the expenditure of Great Britain advanced from £2.31 per capita in 1890 to £3.52 in 1900, declining slightly (to £3.50) in 1910.

But the vital point is whether expenditure has outstripped wealth. Owing to the extreme uncertainty of all calculations of national wealth, this is a point which cannot be determined with absolute accuracy. They appear, however, to have kept pace with national wealth in France, but to have fallen slightly behind in the United States and considerably behind in Great Britain.

Respecting local expenditure our information is less explicit. Figures cannot be presented for as many countries. In the United States we have census figures on this point up to 1890, but no investigation into local expenditure was made in the census of 1900. In 1904 a special census inquiry was made on wealth, debt, and taxation. In 1870 local expenditures were 47 per cent of all public expenditures, in 1890 they had reached 61 per cent, and in 1904 they were 63.8 per cent. In Great Britain the share of local expenditure rose from 34 per cent in 1870 to 44 per cent in 1890 and 55 per cent in 1910. This increase in local expenditures is to be accounted for chiefly by the fact that the rapidly increasing developmental expenditures fall in great part upon the local governments. To estimate their true significance for the general welfare and for the financial outlook of a nation, the expenditures should be weighed as well as measured. In general, the growth of military expenditure is to be deplored. Yet even this has its compensations, since the army, especially in some of the more eastern parts of Europe, contributes by its training in discipline to industrial efficiency. On the other hand, the increase of the developmental expenditures must,

if wisely directed, be a clear national gain. The facts can only be surmised from the general statements of public expenditure which are classified statistically by administrative departments rather than by classes of expenditure. We may cite a few facts for the national expenditure of the United States, tabulated from the Treasury statements:

EXPENDITURE IN MILLIONS OF DOLLARS

YEAR	Civil and miscellaneous *	War	Navy	Indians	Pensions	Interest on the Public Debt	Total
1870.....	\$48.3	\$57.6	\$31.7	\$3.4	\$28.3	\$129.2	\$288.8
1875.....	63.8	41.1	21.4	8.3	29.4	103.0	267.4
1880.....	51.6	38.1	13.5	5.9	56.7	95.7	261.7
1885.....	82.9	42.6	16.0	6.5	56.1	51.3	255.6
1890.....	74.5	44.5	22.0	6.7	108.9	36.0	290.8
1895.....	82.2	51.8	28.7	9.9	141.3	30.9	345.1
1900.....	98.5	134.7	55.9	10.1	140.8	40.1	480.4
1905.....	127.9	122.1	117.5	14.2	141.7	24.5	548.2
1910.....	171.5	155.0	123.1	18.5	180.6	21.3	651.2
1912.....	172.2	148.7	135.5	20.1	153.5	22.6	652.9

* Exclusive of postal deficiencies.

The table displays in condensed form some tendencies of expenditure in recent years. The fall in the interest charge is accounted for chiefly by the reduction in the public debt, but partly by reduction in the rate on loans. (See DEBT, PUBLIC.) The expanding elements in expenditure in the recent period are civil and miscellaneous, which doubled from 1895 to 1900; war, which increased nearly threefold; and navy, over fourfold. The other major item, pensions, increased somewhat in the same period, but has since manifested a tendency to decline.

Comparison of National Expenditures. A comparison of the budgets of leading nations to show the place occupied in each of the several classes of expenditure is an inquiry which tempts the student, but which is confronted with well-nigh insurmountable difficulties. The most serious is the fact that while data for the finances of the several local governments are frequently missing, the distribution of functions and therefore of financial responsibility between the nation and the various subordinate governments differs greatly in the several States. This distribution rests upon constitutional provisions and administrative regulation. In comparing national budgets we find little that is common to all except the expenses of foreign intercourse, national defense, and public-debt charges. To ascertain, therefore, the proportional costs of the several items of public expenditure would require a compilation of all the expenses of all the local governments in addition to the figures for national expenditure. The lack of figures for such local expenditure renders a statistical study of national budgets, without note or commentary, valueless.

Another obstacle to a simple comparison of national budgets lies in the varying extent to which the nations concerned undertake industrial functions. The inclusion of the postal expenditures would add 229.9 million dollars to the aggregate for the United States in 1910. In most national budgets the postal service is included, but this is not true of Austria-Hungary. The French national budget is charged with the expense of operating the tobacco, matches, and gunpowder industries, together with the expenditures due to the management

of the state forests and domains and the rather limited system of state railways. The Russian budget bears the costs of operation of the alcohol and tobacco monopolies, of the railroad system, and of the state domains. A more common illustration is offered by Prussia, where the cost of operating domains, mines, and railways is about half the aggregate expenditure.

Local Expenditures. It has already been pointed out that local expenditures grow more rapidly than national expenditures, and a few figures indicative of the extent and nature of such local expenditures may be adduced. Rather than single out particular localities, it is better to have resort to the figures furnished by the U. S. census report on *Wealth, Debt, and Taxation* of 1904. The expenditures for governments of all grades were as follows:

National Government	\$617,530,137
States and Territories.....	185,764,203
Counties.....	197,365,827
Cities (over 2500 inhabitants).....	468,637,749
Other minor civil divisions.....	222,682,884
Duplications	69,646,242
Total (less duplications).....	\$1,621,734,557

The expenditure for schools is distributed among the States, counties, and municipalities. The character of expenditure of the national government having been already noted, we may cite from the census the following statement for local expenditure:

Legislative.....	\$7,301,063
Executive.....	2,552,847
Law offices and accounts.....	7,176,091
Finance offices and accounts.....	10,725,828
Miscellaneous general government.....	18,004,135
Courts.....	30,034,003
Military and police.....	54,551,829
Fire department.....	38,183,709
Miscellaneous protection to life and property.....	3,735,670
Health and conservation.....	9,460,520
Sewers, drainage, and other sanitation.....	26,417,047
Street lighting.....	22,010,263
Other highway expenditures.....	93,861,667
Charities.....	58,400,423
Insane.....	23,021,207
Penal institutions.....	24,426,029
Education.....	281,219,278
Parks and recreation.....	14,025,414
Agriculture.....	3,239,000
Interest.....	78,002,287
Industries.....	32,054,394
Investment expenses.....	155,546
Outlays.....	208,475,012
All other.....	19,098,160

Public Revenue. The revenues of the state are chiefly derived from taxation, but this is not the exclusive source of income. Omitting minor or casual sources of income, such as fines and gifts, the state derives a revenue from the management of its own property, from its in-

dustrial activities, and from other services which it renders to the community. Nomenclature is by no means fixed, but we may designate the sources of income as prices, charges, fees, and taxes.

1. *Prices*.—Under the head of prices we may include the revenue arising from the sale of public property, such as land or its products. By price we mean a return fixed in the main by private competition. Such a return can be obtained when there is no monopoly of the property to be sold. Whether or not such shall be the aim of the state depends largely upon questions of public policy. As an owner of property, the state is trustee for the people, and a wise policy may in some cases dictate the neglect of commercial interests, while in other cases it may require that they be strictly adhered to. Wherever the state has possessed large domains fitted for agricultural uses, as in the public lands of the United States and of Australia, such lands have been used rather to promote national development than to insure public revenue. Products incidental to the functions of government, such as the lumber from state forests or goods produced in penal establishments, must, if brought into the market, be sold at market prices, lest the state should injure its own citizens. The revenues from these sources are but a small portion of the income of modern states.

2. *Charges*.—Charges may serve as a general term for the amounts paid for specific industrial services which the state performs. These include the operations of the post office, the telegraph, the telephone, the railroad, municipal gas and electric plants, and the sale of certain products such as liquors, tobacco, matches, etc. The range of industrial activity represented, though of course not equally extensive in the various modern states, is varied and comprehensive. In all there is a common feature, public monopoly, which makes the term "charges" for public service more appropriate than "prices." The determination of the charge rests upon the motives which lead the state to enter upon a specific kind of industrial activity. That motive is seldom to obtain the largest possible revenue from the enterprise, although this characterizes fiscal monopolies, such as tobacco and match monopolies, which are frequent upon the continent of Europe. The liquor monopoly as it exists in Switzerland is not wholly fiscal in its purpose, as it seeks to eliminate some of the abuses which grow out of the private production of spirituous liquors. Far more obvious are the social interests involved in the government management of gas and electric-lighting plants, railroads, telephones, telegraphs, and the postal service. In the measure in which these social interests are regarded in fixing charges must the revenue-producing character of the industry be superseded. Hence the tendency under government management to render services at cost. This is well illustrated in the history of the postal service, which in some states has ceased to be a source of net revenue. This feature should be carefully considered in all proposals for the assumption of various branches of industry by the state. From a purely fiscal point of view there is generally greater advantage in private ownership subject to taxation than in public ownership.

3. *Fees*.—Fees are payments for definite services rendered by public authorities in the ad-

ministration of public business. Such are court fees, license fees, and the like. They are based upon the theory that a special service is rendered to those who pay them over and above the general social service which the operations of government imply. As the benefit derived by the individual is intangible, there can be no question of an exact equivalence between the payment and the service rendered. The only rule which can be fixed is that they should not be so oppressive as to interfere with the orderly conduct of public affairs. Thus, marriage fees, either to the state or church, should not be so high as to promote unions not legally sanctioned. Court fees should not deprive the poorer classes of the protection of the law. Similar to fees in their nature are the taxes called *special assessments* in American finance. When a street is opened or a highway improved, while the public receives a benefit, yet the chief advantage is frequently enjoyed by the owners of the abutting real estate. For this they are compelled to pay by a special rate levied upon such real estate. Special assessments, like fees, contain therefore an element of commensurable private advantage. Unlike fees, they are levied upon real estate and are applied for the purpose of enhancing the value of that real estate. See TAX.

4. *Taxes*.—In the three kinds of payment thus far discussed there is in general a direct benefit to the individual, and the payment is made only in exchange for a direct service of the state. In this they differ radically from taxes. The latter are forced contributions to the public treasury. In practice, as in the most advanced financial theory, taxes rest upon the duty of citizens to support the state. The benefits which the citizen enjoys from the existence of government are general and not specific, and no attempt to establish a parallel between such benefits and tax payments can be successful. Writers on finance have indeed frequently attempted to justify taxation on the ground that government renders an equivalent service in protection to person and property; but there is obviously no demonstrable relation between the payments which may be exacted from individuals in taxation and the protection afforded them. Taxes are based, then, upon the duty of citizens to support the state of which they are members; and the measure of such duty is found in their ability to bear a share of the burden. For a comprehensive treatment of the theory and practice of taxation, see TAX.

REVENUES OF THE UNITED STATES FOR THE FISCAL YEAR ENDING JUNE 30, 1912

<i>Prices, from sales of:</i>	
Public lands.....	\$5,392,796
Indian lands.....	3,204,793
Ordinance material.....	224,732
Government property.....	2,782,028
<i>Charges:</i>	
Postal service.....	246,744,016
<i>Fees:</i>	
Consular, letters patent, land.....	4,478,829
Customs fees, fines, penalties.....	1,387,114
Immigrant fund.....	3,336,519
<i>Taxes:</i>	
Internal revenue.....	321,612,190
Customs.....	311,321,673
Revenues, District of Columbia.....	7,774,381
National banks.....	3,637,008
<i>Not classed:</i>	
Chinese indemnity.....	105,081
Profits on coinage, bullion, deposits, etc.....	6,970,159
Judicial fees, fines, penalties.....	1,274,839
Forest reserve fund.....	2,158,344
Other receipts not classed.....	16,302,203
Total ordinary receipts together with postal ..	
\$938,646,682	

Revenues of the United States. In modern nations taxation greatly overshadows all other sources of revenue. This is brought out in a detailed statement of the revenue of the United States for the fiscal year ending June 30, 1912, in which the sources of income are arranged, so far as practicable, by classes.

It would be possible to carry the classification into further detail, and to place under the main heads a number of items falling together under receipts not classed. In each case the receipts are gross, without deduction for expenditures connected therewith, which may in some cases exceed the receipts.

RECEIPTS OF THE UNITED STATES IN MILLIONS OF DOLLARS

Year	Total	Customs	Int. Rev.
1840.....	\$19.5	\$13.5
1845.....	30.0	27.5
1850.....	43.6	39.7
1855.....	65.3	53.0
1860.....	66.1	53.2
1865.....	322.0	54.9	\$209.5
1870.....	396.0	194.5	194.9
1875.....	284.0	167.2	110.0
1880.....	333.5	186.5	124.0
1885.....	323.7	181.5	112.5
1890.....	403.1	229.7	142.6
1895.....	313.4	152.2	143.4
1900.....	567.2	233.2	295.3
1905.....	544.2	261.7	234.0
1910.....	675.5	333.6	289.9
1912.....	691.7	311.3	321.6

Revenues of Various Nations. The comparison of revenues of foreign countries is beset with difficulties similar to those which are encountered in comparing their expenditures. Just as there are certain unquestioned functions of national states, so there is at least one unquestioned source of national revenue, viz., customs duties. But with it are found associated other forms of taxation, both indirect and direct, and other forms of income, according to the scope and variety of the functions exercised by the national government. The most marked contrast between the United States and Great Britain on the one hand, and the continental countries on the other, is in the extent among the latter of industrial income.

Local Revenues. The most comprehensive statement of local revenues in the United States is given by the census report on *Wealth, Debt, and Taxation*, for the year 1902. According to this report the revenues of the several local governments were as follows:

States and Territories.....	\$189,165,067
Counties.....	199,119,468
Cities over 25,000.....	424,763,472
Cities 8,000-25,000.....	75,216,973
All other minor civil divisions.....	219,304,262
Total.....	\$1,107,569,242

The sources of local revenue are classified under general revenues, amounting to \$934,629,816, and commercial revenues, such as receipts from public industries aggregating \$172,939,426. The general revenues are classified as follows:

General property tax.....	\$708,680,244
Special property and business tax.....	62,327,400
Poll taxes.....	16,551,786
Liquor licenses.....	55,241,197
Other licenses and permits.....	19,841,348
Fines and forfeits.....	7,882,322
Subventions and grants.....	60,984,892
Donations and gifts.....	2,803,477
All other.....	2,127,150

Public Debt. A third division of the subject of finance concerns public credit and its use. As the creation of public debt often required by the exigencies of national life rests upon the public credit, a complete theory of finance must concern itself with the means by which public credit is established and maintained, as well as the methods by which it is drawn upon for the support of the public finances.

Like the credit of individuals, public credit rests upon confidence; and like the credit of individuals, such confidence rests upon past performance of obligations incurred. Without a sacrifice of sovereignty the state can offer no other guaranty to its creditors. It is true that in certain cases the obligations of one government have been guaranteed as to interest and principal by the government of another state, as in the case of the Egyptian bonds guaranteed by the English government. But in such a case the power which guarantees tends to extend its sovereignty over the government which contracts the obligations. Again, governments have sometimes set aside the receipts from certain revenues, as, e.g., customs, for the payment of interest obligations; but without good faith this guarantee is of little value unless such revenues are placed under foreign administration, as was the case of the customs revenues of Santo Domingo, administered primarily in the interest of foreign creditors by officials named by the President of the United States. Such a plan, while it may support the public credit, is usually regarded as highly objectionable on account of the abdication of sovereignty it entails.

The basis of public credit is therefore the ability of the state to fulfill its contracts and the punctiliousness with which it actually does so. Public debts are therefore bonds without mortgages or similar security. They are primarily contracts to pay interest, but may include also an obligation to pay the principal, either in whole or in part. Usually, in European countries, no fixed date is set for the repayment of public debt. A different policy is pursued by the United States. See **DEBT, PUBLIC**.

Sinking Fund. Provision for the payment of public debt is sometimes made by the establishing of a sinking fund. A sinking fund contemplates the gradual extinction of a debt, provided by the law authorizing the debt, and while it has been discarded in the practice of the more advanced nations, is sometimes used by the nations of weaker credit. It is needless to say that the faithful fulfillment of the condition when it exists tends to support public credit. Sinking funds may assume various forms, but the principle is simple. The state guarantees an annual appropriation, as, e.g., 1 per cent of the principal of the debt, which is used to repurchase a part of the debt in the market. The bonds so purchased are not destroyed, but are set apart in a separate fund or sinking fund and continue to draw interest. The interest of the first year's installment to the fund plus the second year's installment is used to purchase bonds. By this process carried out the government in time acquires possession of all its own bonds, which are then destroyed and the debt canceled. This plan seems very simple and in the early part of the nineteenth century was widely adopted. Its defects are, first, that the state has not always the money available for such an appropriation; second, that it is

not always expedient to purchase bonds in the market because of the premiums upon them, and, third, that such a reserve of unredeemed securities can with difficulty be maintained inviolate in times of emergency. In view of these defects, sinking-fund arrangements planned in this way by statesmen like Pitt and Hamilton have never been followed to their logical conclusions. Modifications of one sort and another have been introduced which have left of the original institution little more than the name. This is shown in the history of the sinking funds in the United States, especially that of 1802. By the Law of Feb. 25, 1802, it was provided that, after the gold receipts from customs had been used to pay the interest, they were to be applied "to the purchase or payment of one per centum of the entire debt . . . to be made within each fiscal year, which is to be set apart as a sinking fund, and the interest of which shall in like manner be applied." No obligation could be more formal, yet it was not formally observed. No attention was paid to this provision after the war, and at its close the payments and purchases did not proceed in the orderly fashion prescribed by law. The surplus revenues which for a time were abundant were used for the cancellation of debt far more rapidly than had been contemplated by the law. Nor were the bonds called in or purchased retained as a fund, for by the Law of July 14, 1870, it was ordered that they be canceled and destroyed, and that an amount equivalent to the interest upon such canceled bonds be paid annually into the sinking fund. In the subsequent history of the country there were epochs in which there was no debt cancellation, others in which it proceeded rapidly, just as the condition of the revenues permitted. Congress and the Treasury Department have been satisfied by the explanation that the aggregate debt reduction has been far greater than that contemplated by the law. The sinking fund to-day therefore stands practically as an expression of the policy of debt reduction, and of the authority of the Secretary of the Treasury to purchase bonds in the market for this purpose, and has no other significance. The expression occurring in financial reports of purchases for the sinking fund means simply for debt repayment.

Whenever the financial condition of the nation warrants a repayment of debt there are simpler methods of proceeding than sinking-fund arrangements. Bonds may either be called in or may be purchased in the market. Theoretically purchase in the market is preferable when the bonds are below par, but as this condition is not likely to occur in any state which has a surplus for debt payment, the case is of no practical importance. On the other hand, the terms of the contract may be such as to prohibit calling in the bonds, as has been the case in the United States, and leave no way of redemption open except purchase at a premium. In such a case the premium paid is to be compared with the saving of interest which would have to be paid during the unexpired term of the bond before redemption becomes optional. Much more suitable, therefore, for the purposes of fiscal administration are bonds which are not limited as to term of payment, but which can be redeemed at their face value at the will of the government.

When there are no specific sinking-fund attachments to public debts, the repayment of

public debt might be regarded, so far as the contract with creditors is concerned, as a work of supererogation. But just as a business man gains in credit by prompt or anticipated payments, so a policy more liberal to creditors than legal requirements demand redounds to the credit of the state. Repayment of the principal is not essential, as we have seen, to the maintenance of public credit, as states whose debt continues to increase stand in good repute, but is a policy to be recommended. Of its utility as an outlet for surplus revenues we shall speak in discussing financial policy. For conversion of public debts, see DEBT, PUBLIC.

When loans have been raised for industrial purposes there are valid reasons for the adoption of a fairly rigid sinking-fund policy. As we have seen, it is customary to operate many public industries on the principle of covering costs, but without surplus profit. Charges should be fixed at a level sufficient to sink the principal of the loan before the equipment of the public industry wears out or becomes obsolete, and such a policy would involve the maintenance of a sinking fund. This principle of finance, though unquestionably sound, has found only occasional observance in practical financial policy.

Having considered public debt in relation to public credit, we may briefly outline its relations to fiscal operations. The creation of debt is a source of revenue which serves to equalize the difference between public expenditures and ordinary revenue. This difference may be caused by irregularity of revenue or casual deficit. Loans are then required in anticipation of revenue, and in such cases they should be temporary, of short duration, subject to redemption at will or in a brief period. If at the expiration of this period there is no accumulation of funds available for payment, the only alternatives are an extension of the loans or their incorporation in the funded debt. The difference between ordinary revenue and expenditure may be caused by a national emergency, such as war, to provide for which the ordinary sources of income, however stretched, are wholly inadequate. Or, again, the difference may be caused by the investment in great public works, which either in their effect on the general tax-producing capacity of the people or by revenues appropriate to themselves are expected to pay for themselves in the long run. In the cases named a resort to funded debt is the only way open by which to meet such expenditures. For a further development of these principles, see DEBT, PUBLIC.

Financial Policy. The aim of financial policy can be summed up as the attainment of adequate revenue, a revenue adequate to fiscal needs and responsive to changes in them. This involves the questions of distribution of sources of revenue and elasticity of income.

The separation of government into national and local authorities, with the interposition of a third class of regional authorities in the case of Federal States, brings with it a division of expenditures and the need of adequate revenues for each form of government. The ideal of independence in action within their several fields can only be realized when to each are assigned certain independent sources of revenue. Without such revenues these authorities become mere disbursing offices lacking vitality. The problem of proper revenue is the most serious one which confronts the maintenance of a

distribution of authority sanctioned by usage or proposed by legislation. It is a question of practical statesmanship, which must in each country take into consideration the facts of national development and cannot be decided upon general financial or political principles.

The question at issue is partly one of law and partly one of fact. What sources of income does the law allow to the several bodies, and are these in fact suitable? In the United States the Constitution gives the Federal government the power to collect taxes, duties, imposts, and excises, but prohibits it from imposing a capitation or other direct tax except in proportion to the population. This in fact excludes the Federal government from the field of direct taxation, which is left to the States. The interpretation of the term "direct taxation" has varied in different periods of American history. The practical effect of the varying interpretation of the term is illustrated in the history of the Federal income tax. Such a tax was levied in the time of the Civil War and was held to be a constitutional exercise of the Federal taxing power. The income tax was in 1894 declared to be a direct tax, and therefore unconstitutional, by the Supreme Court. An amendment to the Constitution authorizing the Federal government to levy income taxes received the necessary adhesion of the States in 1913, and an income-tax law was passed in the same year. (See *Tax*.) Should the nationalization of railroads demanded in many quarters ever become a fact, it would withdraw from the States an important and remunerative object of taxation. Given the present functions of the Federal government, the revenue opportunities have proved ample for its purposes.

In the States the revenue question is more perplexing. Except that they may not impose customs duties, there is no limitation upon the power of the States. But since the needs of the State governments are relatively small as compared with those of local governments, the relation of the two is of great importance. It cannot be said that there is anything like a system in the actual distribution of revenue sources between the two forms of government. It must, however, be obvious that the orderly development of each requires that well-defined sources of income be assigned in such a way as to satisfy the more rapidly increasing necessities of the local governments.

A revenue system should therefore supply current needs, should increase in productivity as those needs increase, and should moreover be regular in its returns and capable of meeting the fluctuations of financial necessities. The customs revenue is peculiarly subject to fluctuation, and a State which relies solely upon it is exposed to serious embarrassment. This is well illustrated in the financial history of the United States, and depicted in the table of receipts of the United States, given previously in this article.

Imports on which these revenues are based follow the vicissitudes of trade and reflect the hope or fear of tariff changes. Far more regular has been the productiveness of the internal-revenue taxes imposed by the United States. To meet these fluctuations of revenue from certain sources, as well as to meet fluctuations in the need for money, the financial system of every nation needs some elastic element, some tax whose productiveness can be reduced or

augmented, as the case may be. The United States may be said to have such a source of revenue in the internal-revenue system. When drawn upon for the increased expenditure for the war with Spain, the effect upon the revenue was rapid and considerable. But nowhere else has this element of elasticity attained the importance which it has assumed in England, where the income tax is used for this end. In the United States it has not been necessary to increase or reduce taxation frequently, since in the past 30 years there has generally been a surplus revenue which has been applied to debt reduction.

Local Finance. As a result of the division of authority and functions between central and local governments, a distinction is coming to be clearly drawn between general and local financial operations. The extent of the latter has been treated at the beginning of this article; it is here necessary to emphasize some of the chief principles of local as distinguished from general finance.

Expenditures.—Those expenditures which result in purely local advantages are most naturally borne by the local government. Such, e.g., are those which are incurred for local improvements and the costs of local administration. Besides these expenditures, there are some which are of general interest, but are best placed under the control of local bodies, so as to be more nearly under the supervision of the public. Examples of expenditures of this kind are those which are incurred in the support of primary education and for poor relief and the administration of justice. It is these classes of expenditures which are increasing most rapidly.

Revenue.—If local government is to possess real autonomy, it must possess independent sources of revenue. Certain classes of taxation cannot be employed by local governments. Such, e.g., are the income and general excise taxes, import and export duties; taxes on bequests and inheritance. These forms of taxation are difficult to collect by local authorities; and if practice is not uniform throughout the state individuals and industries will escape taxation by shifting from one locality to another. There remain taxes on real property and on local occupations. Neither of these objects of taxation can escape the local assessor. Franchise taxes frequently afford a considerable local revenue. Further revenues may be secured through charges for special benefits, e.g., water rates, and special assessments (q.v.) may be employed to cover the outlay for some of the more burdensome local improvements. It remains true, however, that the revenues which can be obtained from local sources are frequently insufficient to cover the expenditures which are incurred by the local government. In many countries it has become customary to supplement local revenues by grants from the central treasury. In England, up to 1887, many grants for specific purposes were made; since that year various duties, collected by the central authority, have been marked off for local uses. In the United States the most familiar application of this principle is the grant of State funds for educational purposes.

Debt.—The local government, even more than the central authority, is often compelled to incur debts to cover the cost of undertakings which are too extensive to be paid for out of current revenues. A large proportion of local

expenditures are *productive* and should therefore be met by loans which distribute the cost over a long period. Local authorities are, however, frequently inclined to be reckless in the expenditure of resources thus gained. For this reason the central government usually exercises close supervision over the creation of local debts. In the United States State constitutions frequently fix a limit beyond which localities cannot go in incurring debts; in many cases debt limitation is provided in municipal charters. In Great Britain a special act of Parliament is required in order to authorize a municipal loan; and a similar practice is followed in France and other continental countries. In England the central government acts as an intermediary in securing loans for local bodies, thus giving to the latter the advantages of the national credit; in Belgium the national treasury keeps a fund out of which loans are made to municipalities; and in Germany some part of the workmen's insurance funds administered by the state government are loaned in this manner. See TAX; MUNICIPAL GOVERNMENT.

WAR FINANCE

The coming on of the European War naturally introduced a very great change into na-

course, those of the belligerent nations. Coincidentally with this great expansion in public expenditure, followed the necessity of great increases in public income; and from the latter came the necessity of new types of taxation, as well as unprecedentedly high rates under old taxes. At the same time there occurred a vast enlargement of public debt, due to the fact that even with the most urgent effort to equalize budgets by means of taxation, war expenses had become so excessive as to necessitate a very heavy resort to borrowing. Although, as elsewhere noted, public finance necessarily relied, so far as practicable, upon taxation as a means of obtaining needed revenue, it was true that, practically from the beginning of the war, nations recognized that it would be essential to borrow heavily with a view—it was true—to later refunding and perhaps partial cancellation, but with the distinct expectation that the debt thus created would continue in effect for a great while.

In studying war finance a beginning should be made by reviewing expenditures during the period of belligerency and immediately thereafter. These may then be compared with the figures already given (page 552) for peace outlays. The table below surveys the expenses of some of the principal countries.

Incomes of Chief Countries. In order to make provision for these enormous expenditures the various governments almost from the outset of the war sought to increase taxation, although this plan was resorted to in a very varying degree. In some countries, notably Germany, the belief that the war would be short and that its cost could best be met by borrowing led to a limitation of new taxes and a substitution of loans, so that war finance was largely concerned with borrowing, either through popular loans or through short-term borrowing at banks. In others, however, it was recognized from the beginning that action designed to provide an adequate basis of taxation was absolutely essential, and accordingly new methods of taxation were devised and applied. In the table on the following page, is furnished a survey of the income from taxation and other sources (non-borrowing) obtained by each of the principal countries during the war period.

tional financial practice as well as financial conditions, although war experience subsequent to 1914 vindicated rather than altered the conclusions and theories which had been developed as a result of prewar experience. Probably the most striking feature of the European War from the financial standpoint was the enormous expansion of the expenditures of central governments all over the world; conspicuously, of

Chief Sources of Taxation. While there was no uniformity of taxation throughout the world during the European War some general features may be regarded as practically identical in most countries. Among these was an early resort to income and excess profits taxes. Of these types of taxation the best examples were afforded by the legislation of Great Britain and the United States. Great Britain was naturally

first in the field and having first attempted to provide for her necessities by means of an advance in the rates of taxation it was determined to undertake new types of levy in that field. In 1914 Great Britain accordingly doubled the rates of the income tax and imposed additional internal revenue or excise duties; these, however, speedily proving insufficient and being succeeded by new legislation adopted early in 1915.

taxation. No actual revenue measure was put into effect prior to June 30, 1917, which was the end of the fiscal year, but the question of tax legislation was taken under advisement and on October 3 of that year a measure whose yield was estimated at \$3,400,000,000 was enacted by Congress. This provided for income surtaxes and an excess profits tax on the same basis as that of Great Britain. An abortive

¹ Figure for second half of 1914. Figure for 1913—4,718.

This legislation was practically forced by the fact that from April 1, 1915 to March 1, 1916, government outlays had been met to the extent of about 84 per cent by means of borrowing. The new plan of 1915 accordingly provided for an increase of normal income tax rates to 3s. 6d. in the pound, while a super tax increasing at a progressive rate from 10d. to 3s. 6d. was imposed upon incomes ranging from \$12,500 to \$50,000. For the first time, the excess profits tax was introduced at the rate of 50 per cent on incomes which had been earned during the months from Aug. 1, 1914 to July 1, 1915. A basis for the levy of this tax was afforded by authorizing the contributor to establish a basic prewar income representing the average returns for any two of the three years preceding the war. Receipts in excess of the amount thus obtained by the taxpayer over and above his average prewar income were taxable at the 50 per cent rate already referred to. This system of taxation was continued throughout the war, although from time to time with changes of rate and extensions of the number of taxable objects as circumstances seemed to require. Customs taxes were decidedly raised and the rates on alcoholic drinks advanced almost to prohibitive points. Stamp duties and luxury taxes were also added and proved more or less productive although in varying degrees.

The United States did not enter the war until April 6, 1917, and as in the case of Great Britain found it necessary to defray her early expenses by means of loans rather than by

measure adopted on March 3, 1917, had provided for an excess profits tax which, however, had not been collected, so that the act of Oct. 3, 1917, was the first real war revenue measure. Exemption of incomes was fixed at \$1,000 for unmarried persons and \$2,000 for married persons and the normal tax rate was set at 2 per cent on incomes over these amounts. Surtaxes beginning with a rate of 1 per cent on incomes over \$5,000 and running up to 50 per cent on incomes in excess of \$1,000,000 were imposed. The excess profits tax was levied on business incomes in excess of an amount equal to a maximum of 9 per cent return on the capital employed by business on the average during the years 1911-13. On all excess incomes as thus ascertained, a profits tax ranging from 20 per cent for the first 15 per cent up to 60 per cent on everything over 33 per cent was imposed. The result was to bring in an enormous return to the Treasury which however was still far behind the necessities of the Treasury, and according it was undertaken to enact new legislation about the middle of 1918, designed to enlarge the income yield. This legislation was modified as a result of the announcement of the Armistice, but nevertheless took effect in a form which greatly added to the burden of the public. Normal tax rates were set at 12 per cent for 1918 and 8 per cent for later years, while the surtax was altered and applied in such a way as to make it very much more thorough and more burdensome, its rates now running up to 77 per cent on incomes in excess of \$1,000,000.

Taxation in France followed a somewhat different course from that which was pursued in England or the United States, owing to the different attitude of the public toward taxation. The first legislation on the subject made its appearance in 1914 when measures were adopted with a view to providing a regular income in future years. This tax, however, was first made effective in 1916 and applied to all incomes in excess of \$1000, although with suitable exemptions and allowances for dependents. The tax was 2 per cent as a basis but with progressively increasing rates, while accompanying it were excess profits taxes levied at the rate of 50 per cent upon a basis practically similar to that adopted by Great Britain. On July 1, 1916, a special war levy was made on all citizens who had not actually been compelled to serve in the army while higher taxes were levied on incomes from investments, and extensive internal revenue taxes occupied with heavy fees and stamp dues on postage, telegrams, and the like were also introduced. A part of these taxes, however, did not come into effect until the year 1917. Additional taxes were agreed upon just at the close of 1916, with severe penalties for non-payment, while in 1917 it became necessary once more to amend the income tax and obtain some modifications in the existing system. Among these was a tax of 4 per cent on all business profits with special levies on the volume of retail business (a kind of sales tax). In 1918, income tax rates were still further raised and luxury taxes were introduced although with somewhat questionable effect.

Germany, as already seen, had been under the impression that the war would be a short one and that taxation need not be carried far. Accordingly the early war period in Germany was financed largely by means of loans and bank accommodation, the first substantial increase in taxation being provided by the Act of 1915, at which time the several German states materially increased their local direct levies upon the citizens. The imperial government in 1916 in order to meet recurring deficits enacted war profits taxes in addition to internal revenue duties and excess profits taxes. These measures were adopted on June 5, 1916, and were followed by an advance of 20 per cent in the war profits tax beside taxes on coal and railway traffic and on a variety of objects and transactions. Action, however, was slow and receipts were small up to the middle of 1917. In 1918 there was an extension of the internal duties as well as increased taxation upon war profits, but Germany still refused to resort to the heavy taxation on incomes and estates which had been adopted by her principal opponents. Up to the close of the war, she continued to hold back not only in connection with taxation, but also in enforcement of existing taxes applying them only upon an incomplete and unsatisfactory basis with correspondingly poor yield, reliance being chiefly placed upon short-term borrowing and currency note issues and largely upon the large public loans which were floated through popular subscription. A like policy was pursued in Austria taxation being considered already very burdensome so that extreme reluctance to the levy of new taxes was felt at the outset. However, in 1916, it was found necessary to increase the rate of existing taxes and in 1917 new methods of taxation were called for. Very little progress however was

made in introducing them, the government continuing to rely upon loans and bank borrowing.

Italy, on the other hand, recognized the necessity of a resort to taxation practically from the very beginning of the war, enlarging the previously existing rates under the act of Oct. 15, 1914, and then providing a substantially heavy income tax with a provisional excess profits tax and a great variety of temporary expedients of one kind or another borrowed evidently from the experience of Great Britain and of France. In 1916, further effort was made to enlarge taxation, but little success was secured owing to the disruption of business conditions, although the tax on war profits was materially enlarged and some success was had in collecting it. In 1918 great extensions of luxury and consumption taxes were made and in 1919 a supplementary income tax was resorted to.

In other countries a variety of fiscal expedients were resorted to. The southeastern states of Europe were not very successful in collecting taxes and found it necessary to provide funds through issues of paper currency, popular loans, and foreign borrowing. Japan was in a peculiar position, owing to the fact that although a belligerent her expenses were not very greatly increased during the war, her national debt in fact being materially reduced. Some reductions in land taxes were effected, while prewar income taxes were also rendered much less burdensome, through various types of modifications. In the neutral countries, including the Scandinavian states, Holland and others, special problems existed which grew out of the demands resulting from the war involving as these did an enlargement of public expenditures more than three fold. The advance in taxation in such countries as Holland, Switzerland, and Scandinavia varied considerably, some of the countries contriving to avoid a very great increase in direct taxes as compared with indirect taxation, although in nearly all it was necessary to borrow heavily abroad as a means of meeting the tremendous increases which had taken place in the cost of carrying on government.

Relations With Banks. As has been seen, it was true in nearly all of the European countries that they were taken by surprise at the opening of the war and found it necessary to fall back on bank loans in order to provide themselves with the funds absolutely necessary to meet their requirements. This, as noted elsewhere, was an inevitable episode in war finance and was not open to criticism save in so far as it might be adopted as a systematic policy. Unfortunately in several countries fear of popular dissatisfaction led the financial authorities to make this method of temporary financing practically permanent. Indeed it may be said that of all the countries which were affected by the European War, whether through direct belligerency or in some indirect way, the only ones which had the national solidarity to tax themselves severely and make the taxation really effective were Great Britain and the United States. Other countries were divisible into two classes: Those which like Germany made but little effort during the early war years to impose new taxation and those which, like Italy, while imposing the taxes in theory, found it hard to collect them in practice. In falling back upon the banks, the various governments resorted to methods of advance which had not been tried in any such form in former struggles. Relatively small use

of legal tender paper or "flat money" was made but the banks were required to take and distribute short-term obligations which were then funded from time to time into longer term loans as circumstances seemed to permit. The fact that the subscribers to these loans were encouraged to borrow from the banks the funds which were necessary in order to enable them to make good their subscriptions naturally tended to produce in all countries a highly inflated condition of prices, together with a steady disappearance of specie notwithstanding an early embargo upon movements of coin which took effect in nearly all countries, comparatively early in the struggle although at slightly differing dates. The United States was of course the last to declare such an embargo, owing to the fact that it did not enter the war until the year 1917 was well advanced. Heavy borrowing at the banks in nearly all countries left these institutions at the close of the war in a very unliquid condition, their government paper holdings being "frozen" owing to inability to find buyers for them either at home or abroad due to the deterioration of public credit. But reliance upon foreign borrowing which was characteristic of practically all European countries that had found themselves able to get access to other markets, left all of them at the close of

cost of their government to such an extent as to make it possible to pay the necessary sums from the proceeds of taxation thereby avoiding further borrowing, while at the same time enlarging their surplus export power sufficiently to provide a balance large enough to furnish the necessary funds abroad with which to pay interest and maturing obligations. This latter necessity was the more obvious because of the fact that for one reason or another it had been found necessary to "release" a great deal of gold as the war advanced thereby reducing the bank reserves and in some cases bringing the specie stock to so low an ebb that it was exceedingly doubtful whether any restoration of gold redemption could be brought about in the near future.

Results of Inflation Policy. The self-conscious inflation policy which was thus adopted by the belligerent governments was soon proven disastrous. It was not only exceedingly disturbing to business, but it also defeated the efforts of the governments which resorted to it as a fiscal expedient. Price levels rose rapidly and enormously in nearly all countries as may be seen from the table of index numbers below.

The effect of this advance in prices, brought about as it was by the practice of borrowing over-heavily at banks was to make commodities

the war with tremendous external obligations which they were in no position to liquidate, owing to the fact that as a result of the conflict their productive power had been very greatly decreased. An unavoidable consequence of the drawing off of a large share of the population from economic occupation had been in all a corresponding curtailment of productive effort. The close of the war therefore found practically all European countries facing a highly complex problem in public finance—that of reducing the

and services cost enormously more than they otherwise would. Particularly harmful results were experienced in the case of those countries which found it necessary to apply to foreign markets for munitions and supplies. Nearly all of the European countries had found themselves obliged at an early stage to buy heavily in the United States. Although the American price level had risen considerably even before our entering the war the advance had not been comparable to that which occurred at a later

date, while such as it was it was directly ascribable to the heavy buying of the European governments and to the transfers of gold which they made to the United States in payment. As the foreign currency units deteriorated in value as measured by their power to command commodities at home, they deteriorated fully as much or more in their power to command American dollars in New York. The result was that when they were expended in the United States the amount of commodities realized as the result of the large sale of bonds either at home or in this country was relatively small, the short-term borrowing policy thus defeating itself by preventing the governments which resorted to it from getting the full value of taxation or loans which they had used as a means of obtaining money. This criticism, while theoretically sound, must of course be considered in the light of the fact that the industrial power of various countries had become so greatly reduced, and so large a proportion of the population had become actually engaged in war operations, that it may be questioned whether in some of the countries a larger application of the taxing power would have produced any result or whether perhaps it would have been endured by the population if added to the general suffering resulting from shortened food and other supplies, as well as from the actual fighting which had to be shared by practically the entire adult male population throughout the belligerent states. The war finance policy, however, left all budgets at the close tremendously inflated and left all debts far in excess of what they would have been had a non-inflation policy been pursued with corresponding doubt as to whether the burden of taxation necessary to pay the interest on these inflated obligations can actually be carried.

Reliance on Direct Taxation. Prewar finances in many countries had relied largely upon indirect taxation. In the United States the Federal government was collecting in normal years the great bulk of its income from customs duties and internal revenue charges. During the early war years a small income from direct taxation was also obtained. (Great Britain had long had the income tax in effect and it was producing substantially at the opening of the war. Nevertheless Great Britain also relied largely upon indirect taxes and the same was true of most countries. The war necessities changed all this and hostilities greatly increased the total burden of taxation and made it absolutely necessary, in order to get the required funds, to rely largely upon the proceeds of direct levying. Not only, therefore, was the total burden of taxation very greatly added to, but also the amount paid to governments as direct deductions from income not dependent upon purchase or the performance of specified acts was greatly enlarged. The effect of this change in method of taxation was undoubtedly to make the burden of the tax loads very much more obvious and to make it seem more serious than would have been true had it been collected entirely through indirect sources. Efforts to reduce budgets after the close of the war did not prove very successful and it was found in almost all cases that indirect taxation had been carried practically to the extreme of its productivity, while the income and excess profits taxes in this country which depended upon these sources of income predominantly had been raised

to a point which was interfering with the growth of wealth. This latter consideration seemed to be of peculiar force in Great Britain and in the United States where during the early postwar years there was an obvious decline in the amount of saving due to the fact that taxpayers of large income really engaged in business found it a matter of relative indifference whether to increase their business expenses to a point which consumed what might otherwise have been additional net income or to pay the latter in large part to the government. With rates on incomes running as high as 60 to 70 per cent the inducement to saving beyond a specified limit was not strong. Hence most postwar fiscal policies which aimed at budgetary economy sought to bring about such economy by a reduction in the burden of direct taxation. One outgrowth of this movement was the adoption in November, 1921, of the Income Tax Revision Law in the United States which eliminated the excess profits tax, while in Great Britain the budget estimates for the year beginning April 1, 1922, abandoned the idea of further debt reduction during the year in question, excess profits taxes having already been repealed in 1921. The postwar taxation on the continent naturally followed a somewhat different course because of the fact that during the war so great a reluctance to further tax increases had been made manifest. The necessities of such countries as France, Germany, and Italy after the war naturally dictated the imposition of new rather than the withdrawal of old taxes because of the necessity of providing means which would carry the very heavy interest charges resulting from the borrowing policies of the war.

POSTWAR FINANCE

Postwar finance, both in the United States and in Europe, has had three principal objects—the reduction or abolition of the enormous taxation of the war period, the funding and consolidation of the debts created during war, and the reduction of government expenditures. Coincident with these it has been necessary to find a means of beginning the restoration of banking systems to a sound condition in order that foreign exchange rates might be placed upon a more stable basis and the international flow of trade and of investments be correspondingly facilitated. One principal obstacle to success in these undertakings has been the tangle of indebtedness existing between the various countries. Such indebtedness represented the aid extended by one country to another during the war, but it was early perceived that in the last analysis there was but one great creditor, the United States and one great debtor, Germany. It was recognized accordingly that the key to the restoration of a sound system of postwar finance was probably to be found in the introduction of a satisfactory system of reparations of payments which should enable the Allied belligerents to collect from Germany enough to enable them to offset the bulk of the losses to which they had been subjected and at the same time to settle with their external creditors. The Treaty of Versailles had made no definite disposition of these questions, leaving final settlement to the so-called Reparations Commission, which in March, 1920, announced a scheme of reparations payments whereby Germany's total obligation was fixed at 135,000,000,000 marks (prewar gold value). Elaborate details con-

cerning the payment of this sum were provided and the bulk of the cash proceeds was assigned to France, Belgium, and Italy. The Germans, however, have since then failed to pay more than approximately enough to cover the cost of holding the occupied German territory which had been taken by the Allies as security for the liquidation of their claims. Accordingly, France and, in a much lesser degree, some of the other countries which have been relying upon the collection of German indemnities as a means of meeting their budget requirements have been unable (July, 1922) to obtain the funds necessary to settle the budget obligations they were incurring in the belief that they would be able to transfer the cost to the Germans. Hence, their budgets have failed to balance, and such reductions in taxation as have occurred have simply cut away the fundamental basis upon which a restoration of soundness would necessarily rest. Great Britain, which has not relied upon any considerable receipts from Germany, has been able gradually to restore her exporting power, despite some serious industrial obstacles such as the coal strike of 1921, and appears to be on the point of beginning the payment of interest upon her foreign obligations. The Continental countries, including France and Italy, show no indications of any such prospect to be realized in the early future and probably cannot be expected to balance their budget satisfactorily without borrowing at an early date. The pressure for reduction of the terrible tax load has been severe in all countries, but even in those where a cut might have been made, as in the United States, the recurrence of socialistic or semi-socialistic antagonism to wealth and capital has resulted in the retention of many war taxes as a peace expedient. The Republican party, elected in the autumn of 1920, largely on a platform of tax reform, adopted in October, 1921, a so-called tax revision measure which, however, has thus far cut the burden of taxation but slightly, although technically repealing the excess profits tax. Great Britain likewise has done away with the excess profits tax and similar action has been taken in other countries. Nevertheless, in all the problem of rebalancing, the budget has been seen to rest more and more upon the restoration of sound banking conditions.

Progress toward sound budgetary conditions was greatest in the United States and in England during 1920 and 1921. In the United States ordinary receipts up to November 12, for the fiscal year beginning July 1, 1921, exceeded ordinary disbursements by about \$155,000,000. The British budgetary situation was less satisfactory, showing deficits in 1920-21, although it was steadily improving. It must be remembered, however, that the main factor in tax policy which accounts for this unfavorable balance was the reduction in receipts from the excess profits tax. Although certain funds were still coming in on this account from excess earnings during earlier years, there was a decrease during the first six months of 1922 of £82,336,000 from the corresponding period of the year before.

In most of the Continental countries the budget situation during 1921, on the contrary, showed no real improvement; in fact, the reverse, although in the case of France and Italy a certain amount of relative advance was scored. In other words, the total amount of outgo of

these countries which had to be made, not from the proceeds of taxation, but either from short-term bank borrowing or the issuing of currency, increased rather than diminished. Figures for Italian finances for the fiscal years ending June, 1921, and June, 1922, were still in the form of estimates, the actual accounts not being available at the latter date. According to the latest estimates, however, it appeared that the deficit for the year would be only about one-half that for the year ending in June, 1921. In other words, the estimated deficit for 1920-21 amounted to 10,300,000,000 lire, while the estimated deficit for 1921-22 worked out at 5,000,000,000 lire. The French government contemplated an expenditure for 1921 amounting to 42,412,000,000 francs, as contrasted with receipts of 23,312,000,000 francs, thus leaving a deficit of about 19,000,000,000 francs to be procured by the flotation of loans. Of this deficit, about 10,000,000,000 francs was regarded as eventually recoverable from Germany under the terms of the peace treaty. Of the ordinary receipts, 14,558,000,000 francs were expected from indirect taxes and monopolies. During the first half of 1921 the total public debt of France rose from 245,000,000,000 francs to 264,000,000,000 francs, calculating in both instances the foreign debt at par. This figure does not include loans floated by the cities and industries in the devastated regions, although the government is responsible for their interest and repayment. In the case of Germany close estimates of the total amount of government expenditures for 1922 were not available.

There has been a prevailing belief for a long time past that the principal element in the existing fiscal difficulties of many countries is to be found in their great outlay for war. This statement is true in broad terms, but requires to be qualified and limited in its application. In some countries, such as the United States, the outlay for war, while a very large part of the total outlay, is in large measure an expense which serves to carry the cost of past wars in the form of interest on public debt. While naval and military expenditure is large in such countries, it is a relatively moderate part of the entire budget. In other countries, like France, the current cost of military support still constitutes a very important fraction of the budgetary outgo. It has, therefore, been thought worth while to compile statements designed to show the comparative situation of the budget in several of the principal countries, with a view to ascertaining approximately how each one of them stands in this matter of expenditure for national defense, especially as compared with the prewar years.

Compared with 1913, the last prewar year, the amounts of money expended for national defense by the governments of France, Italy, and Germany show enormous expansion, but it should be remembered that the purchasing power of the currencies of these countries has undergone varying degrees of depreciation, and that the larger amounts for the more recent years, when reduced to 1913 monetary equivalents, will not show the same degree of expansion as is indicated in the table. During the war years the proportion of the total expenditures made for war purposes was in excess of 80 per cent in all three of these countries. In 1920 the proportion had declined to 60 per cent in Germany, to about 50 per cent in France, and, according to

¹ Total expenditures.

preliminary figures not included in the table, to less than 40 per cent in Italy; in Great Britain and the United States the proportion for the fiscal year 1921 was 26 and 24 per cent, respectively. Nevertheless, the financial burden upon taxpayers of these countries due to military expenditures was much heavier at present than before the war, since national production and income had suffered severely, and fiscal requirements for rehabilitation and reconstruction were an additional drain on national resources and income. While the proportion of total expenditures devoted to military purposes was, according to the fiscal returns, smaller in some countries in 1922 than before the war, these expenditures undoubtedly constituted a larger proportion of the diminished national incomes and were, therefore, a more crushing load on the financially weakened countries of Europe. The following table exhibits the per capita burden of taxation in some of the chief countries of the world:

PER CAPITA TAXATION
On Basis of 1920-21

United States.....	\$53.71
United Kingdom.....	105.47
Australia.....	28.16
Canada.....	35.05
Germany.....	31.59
France.....	44.51
Italy.....	22.80
Japan.....	7.38

The question whether some adjustment or alleviation of this tremendous burden can be devised has occupied the attention of statesmen since the close of the war but has confirmed most in the belief that heavy direct taxes will continue the chief reliance of most countries for a long time to come.

Government Activity in Business. The

participation of the government in business which before the war had produced a very considerable element in the revenue system of some countries (e.g., France, Germany, Austria and others), received a considerable extension in consequence of the war and of necessities attendant thereon, but the success obtained has been so slender as to produce a reaction of opinion among those who in former years regarded public activity of this kind as a probable source of future increase in revenue yield. Railroad operation which was undertaken on an extensive scale both by Great Britain and the United States has proved an actual source of loss and has been discontinued in both countries. The operation of ocean-going ships has been equally disappointing and state manufacture of various kinds of commodities has turned out even more unsuccessfully than during pre-war years. Instead of assuming an increasingly important position in budgets, revenue derived from industrial and business occupations has not only come to form a smaller and smaller proportion of total income; but, as just stated, it has been obtained under circumstances of such difficulty as to make it clear that it must be regarded as an inadequate reliance for the future.

Tariffs and Internal Revenue. Prior to the opening of the war it seemed probable that tariff duties had reached approximately their ultimate position of productiveness. Many years of experiment with the protective tariff in the United States had failed to bring about a total revenue larger than about \$350,000,000 per annum. In Europe the productiveness of tariffs had fallen as rates increased, expense of administration advancing very rapidly. The war had a peculiar effect upon customs duties

in all countries. It naturally diminished the amount of private international trade while it greatly increased the amount of such trade undertaken for the benefit of governments. But this latter type of trade was in general free of customs duties. Except for sporadic and temporary yields of unusual size in a few countries due to sudden changes in the movement of commodities as the result of war, tariff duties were an unimportant source of income especially when compared with the enormous revenue derived from direct taxation. Since the war, this disproportion has in some measure decreased owing to the moderate reduction which has taken place in some countries in the amount of direct taxes. At the same time, there has been a tendency on the part of tariff duties to increase in rate and to become more numerous partly as a result of the particularism of newly erected states in different parts of the world. Protectionism has also assumed a new activity in some countries, notably the United States, with the result that the yield of the tariff has tended to be impaired nearly everywhere. As for internal revenue duties such as the taxes on tobacco they were already near maximum productivity in many countries before the outbreak of the war and the war taxes, in some cases, at least, pushed them beyond the point of maximum productiveness and into the field of partial prohibition. The war added very greatly to the number of taxable objects and in that way increased the yield of internal revenue taxation, but these "luxury taxes" or "consumption taxes" proved so expensive and unpopular from the standpoint of the consumer that soon after the war was over effort was made to reduce them and substantial cuts in their number occurred, the United States eventually abolishing luxury taxes entirely (on and after January 1, 1922). This movement against consumption taxes tended to leave the prewar excises on such articles as tobaccos and liquors as the chief revenue producers. In the United States the prohibition amendment and legislation under it, however, speedily eliminated alcoholic liquors as a foremost source of income. Tobacco has continued to yield an increasing revenue. It does not appear, however, that excise taxes will in any near future play the important part that was allotted to them in the prewar budgetary arrangements.

State and Local Taxation. Expenditures were enlarged as a result of war conditions not only for national governments, but also for local governmental units of every kind. This was the outcome in part of higher prices resulting from the inflation policy of various governments which not only increased the cost of commodities to administrative organizations, but also necessitated rapid advances in rates of pay. Local governments for the most part met these requirements by increasing the rates of taxation on taxable objects already chosen, and by borrowing so far as necessary. State governments, however, in a number of instances, found it desirable to resort to the income tax or in those cases where they already were employing this method of raising revenue, they advanced tax rates on incomes and in other instances added surtaxes. Real estate levies were very generally enlarged throughout the United States. In European countries local governments which possessed tax systems of their own generally followed the plan of intensifying pre-

war rates on existing objects, but without endeavoring to introduce any decidedly novel system of tax contribution. Public debts, however, had a very rapid growth locally as well as nationally and this growth was accelerated by the fact that the practice of exempting local securities from taxation prevailed so widely, especially in the United States, thereby enabling local governments to borrow cheaply. During the business reaction of 1920, the demand for employment designed to take care of individuals who were out of work tended to a great expansion of public borrowing in order to provide funds for the conduct of such public works. On the other hand urgent demand for the disbursement of large bonuses to returned soldiers imposed upon not a few State governments burdens heavier than they felt warranted in putting into taxable form especially in those cases where the bonus was paid once in a lump sum. Hence a further enlargement of local loans.

NEW UNITED STATES BUDGET SYSTEM

The President introduced the budget under the new budget system with a message to Congress, Dec. 5, 1921. It was the result of ten years of active work, beginning with President Taft's attempt to provide for executive control over national expenditures. The law approved June 10 providing for a national budget system and an independent audit of government accounts was hastened by the confused condition of the national finances resulting from the war. The new system, however, was simply a step toward a genuine executive budget system, and, if it were to have that result, radical changes must still be made, but, according to some, they could not be introduced without an amendment to the constitution. The essential element of the budget system is that income and expenses are presented as a whole and considered in relation to each other. For purposes of comparison similar statements running back for a term of years must be considered. In the United States where the transactions of the government are complicated and very numerous this information had never been fully obtained. Appropriations in Congress being in the hands of many separate committees in each House and being without executive control, there were practically no means of providing the information required under a genuine budget system. The machinery outlined in the following paragraphs, including the Bureau of the Budget, an independent audit department under a controller-general and a general accounting office, was established for the purpose of securing the necessary data. Before the close of 1921 the Bureau of the Budget had established a large number of coordinating agencies, including the following:

(1) A Federal Purchasing Board, on which the chief purchasing officer of each department serves with a chief coordinator as chairman named by the President;

(2) A Federal Liquidation Board, coordinating sales under a unified plan of large surplus stocks of the various departments of the government;

(3) A Corps Area Organization, corresponding to the nine Army Corps Areas, to provide for interdepartmental transfers and exchange of supplies in connection with either purchases or sales and operating together with the Purchasing

and Liquidation Boards at Washington to handle properly the entire purchase and supply situation;

(4) A Surveyor General of Real Estate, to handle property owned by the United States and leases of property required for government business and to assign and reassign spaces to the various departments, bureaus, or offices;

(5) A Federal Motor Transportation Agent, to coordinate motor transportation;

(6) A Federal Traffic Board, to coordinate and classify articles shipped by the government and the business involved in the government's annual transportation bill;

(7) A Federal Board of Hospitalization, which provided for the feeding and housing of about 500,000 persons;

(8) A Federal Specification Board, for the standardization of specifications; and

(9) An Interdepartmental Board of Contracts and Adjustments.

Bibliography. The principal sources of information of war finance are still the financial reports of the various countries. For the United States the reports of the Secretary of the Treasury and the annual reports of the Federal Reserve Board give the most complete and authentic information. The League of Nations has also published, preliminary to the international financial conference at Paris, a series of documents which deal at great length with public finances during the war. Volume IV is perhaps the most useful of these publications. The following works are also of service in this same connection: Bogart, *Direct and Indirect Costs of the Great World War*; Anderson, *Effects of the War on Money, Credit, and Banking in France and the United States*; Gottlieb, L. R., *Financial Status of the Belligerents and Post-War Finance* (a series of four monographs issued by the Bankers Statistics Corporation, New York, 1920-21); Benson, *State Credit and Banking during the War and After*; Seligman, *Currency Inflation and Public Debts* (Equitable Trust Company, New York, 1922); Hollander, *War Borrowing*.

FINBACK, or **FIN'NER**. A whalebone whale of the genus *Balaenoptera*, so called because of the marked development of the dorsal fin, which in most whales is either small or wanting. They are the largest of living animals, ranging from 30 feet up to the colossal dimensions of the "sulphur bottom" of the Pacific, which is sometimes more than 100 feet in length. They yield little oil, and the whalebone is of poor quality, so that they are not much sought after. The most common whale on the coast of the eastern United States is a finback, or razor-back (*Balaenoptera musculus*), which reaches a length of about 70 feet. Consult True, *Whalebone Whales of the Western North Atlantic* (Washington, 1904). See Plate of WHALES.

FINCH (AS. *fin*, Ger. *Fink*; connected with Welsh *pin*, chaffinch, Russ. *pienka*, hedge sparrow). The popular name of a great number of species of small birds of the family Fringillidae (q.v.). Many of them have great powers of song and are called by bird fanciers "hard-billed song birds," in contradistinction to the Old World warblers (Sylviidae), or "soft-billed song birds." The name is sometimes used as equivalent to Fringillidae; but the limits of its popular use are ill defined, and some birds are known as finches and also as linnets, or as grosbeaks, etc. The word "finch" often forms part of the popular name of birds of this family, as

bullfinch, chaffinch, hawfinch, etc., and is almost always used with some prefix or qualifying adjective. When used as a general term applicable to the whole family, it includes those nine-primary oscines (q.v.), with more or less conirostral bill, which have the corners of the mouth more or less sharply drawn down. The shape of the bill varies greatly; sometimes it is short and thick, sometimes comparatively slender and elongated, but it is almost always adapted to crushing seeds. Finches feed mostly on seeds and buds, but some species are more or less insectivorous. The family is a very large one, including over 1000 species, divided into about 140 genera, and found in all parts of the world except Australia. They are most abundant in the Northern Hemisphere and especially in America; 200 species and subspecies occur in the United States and Canada.

Finches are nearly allied to the tanagers, weaver birds, and American starlings and blackbirds, and it is difficult to draw any hard and fast lines between these families. The birds called buntings, sparrows, grosbeaks, linnets, redpolls, longspurs, and snowbirds are all finches, but will be treated of under these separate heads. In the United States the name "finch" is not in very common use, though there are some species with which it is constantly associated. The purple finch (*Carpodacus purpureus*) is a good songster and is often called the linnet. The female is plain brown, streaked with black, but the male is suffused with rich rose red, especially deep on the head, so that he is a handsome bird. This finch and very closely allied species occur over the whole of the United States. The rosy finches, of which there are some half-dozen species, constituting the genus *Leucosticte*, are characteristic of the Rocky Mountain region, extending north and westward. They are 7 inches or less in length, brownish or grayish in color, the males suffused with rosy red posteriorly. The grass finch (*Poocetes gramineus*) is more properly a sparrow, and is usually called vesper sparrow or bay-winged bunting. Other well-known finches of the United States are the summer finches (*Peucaea*), of which half a dozen species are found in the Southern and Western States; the painted finches (*Passerina*), of which the indigo bird (q.v.) is a good example; the pinefinches, or siskins (q.v.); and finally, the goldfinches (q.v.). See Plates of CAGE BIRDS, EGGS OF SONG BIRDS, and SPARROWS.

Consult Ridgway, *Birds of North and Middle America*, part i (Washington, 1901).

FINCH, ANNE. See WINCHELSEA, COUNTESS OF.

FINCH, DANIEL (1647-1730), second EARL OF NOTTINGHAM and sixth EARL OF WINCHELSEA. An English statesman. He was educated at Westminster School, Christ Church College, Oxford, and the Inner Temple, entered Parliament in 1679, became a Privy Councillor in 1680, and was First Lord of the Admiralty from 1680 to 1684. In 1682 he was called by his father's death to the House of Lords. After the Revolution he remained, in theory, loyal to the Stuarts, but distinguished between the King de facto and the King de jure and gave in his adherence to the new régime. He was one of the Secretaries of State from 1688 to 1693 and again from 1702 to 1704. He became the leader of the church party and introduced the Toleration Act of 1689 in the House of Lords. He was a favorite of Queen Mary and enjoyed to

some extent the confidence of Queen Anne until he urged that the Electress Sophia be invited to live in England. From 1714 to 1716 he was President of George I's Council. In 1721 he wrote *An Answer to Mr. Whiston's Letter Concerning the Eternity of the Son of God*. He is the subject of Dean Swift's famous ballad, "An Orator Dismal of Nottinghamshire," and he was nicknamed Don Dismal and Don Diego.

FINCH, FRANCIS MILES (1827-1907). An American poet and jurist. He was born at Ithaca, N. Y., and graduated at Yale in 1849. He studied law and began practice at Ithaca. He was a collector of internal revenue during Grant's first administration, and in May, 1880, was appointed a judge of the New York Court of Appeals, to fill a vacancy. In the fall of 1881 he was elected to the same bench for a full term of 14 years. He took a prominent part in the organization of Cornell University, was a member and secretary of the board of trustees for many years, and in 1892 became dean of the law school. His literary work consists largely of poems, among the best known of which are "The Blue and the Gray" (1867) and "Nathan Hale" (1853). A volume of his verse was published in 1909 under the title *The Blue and the Gray and Other Verses*.

FINCH, HENEAGE. See NOTTINGHAM.

FINCH, WILLIAM ALBERT (1855-1912). An American lawyer and law writer. He was born at Newark, N. J., and, graduating from Cornell University in 1880, was admitted to the bar in the same year. Until 1891 he practiced at Ithaca, N. Y., and from then until his death he was professor of law at Cornell. He became known as an authority on the law of real property, and he published *Finch's Selected Cases on the Law of Property and Land* and *The Law of Property and Land—A Syllabus* (1900).

FINCHLEY. A municipality of Middlesex, England, about 4 miles north of London City (Map: London, C 6). The town owns its electric-lighting plant, a fine recreation ground, 16½ acres in extent, and a group of workmen's dwellings. Pop., 1901, 23,899; 1911, 39,410. Finchley common was a favorite resort of Dick Turpin, Jack Sheppard, and other celebrated highwaymen, who made it a dangerous neighborhood as late as the close of the eighteenth century.

FINCK, FINCK, FRIEDRICH AUGUST VON (1718-66). A Prussian general, born at Strelitz. He served successively in the Austrian (1735), Russian, and (after 1743) Prussian armies and was appointed adjutant major to Frederick the Great. In 1759 he was promoted lieutenant general. Detailed by Frederick the Great to assist Prince Henry in the defense of Saxony, he compelled Field Marshal Daun to retreat, but expostulated with the King when ordered to pursue. He followed Daun as far as Maxen, where he was attacked by an overwhelming body (42,000) and compelled, after a brave defense lasting two days, to surrender his entire force (11,000). Although personally blameless, he was condemned by the military tribunal to be expelled from the army and to be imprisoned in a fortress for two years. In 1764 he entered the service of the King of Denmark. He died at Copenhagen. Consult Mollwo, *Die Kapitulation von Maxen* (Marburg, 1893).

FINCK, HENRY THEOPHILUS (1854-1926). An American musical critic, born at Bethel, Mo. A few years after his birth the family removed

to Portland, Ore. There he studied piano and violoncello, and taught himself Latin and Greek so thoroughly that he was able, in 1872, to enter the sophomore class at Harvard, where he devoted himself chiefly to philosophy, the classics, and music, the last under Prof. John K. Paine. In 1876 he attended the Bayreuth Festival, of which he wrote accounts for newspapers and magazines. A subsequent fellowship from Harvard enabled him to spend three years in study in Berlin, Heidelberg, and Vienna. In 1881 he became musical editor of the New York *Evening Post* and entered upon his long propaganda for Wagner's music, becoming the leading American advocate of that composer's theories. His writings include: *Romantic Love and Personal Beauty* (1887); *Chopin, and Other Musical Essays* (1889); *Pacific Coast Scenic Tour* (1890); *Spain and Morocco* (1890); *Wagner and his Works* (1891); *Lotos Time in Japan* (1898); *Primitive Love and Love Stories* (1899); *Pictorial Wagner* (1899); *Anton Seidl* (1899); *Songs and Song Writers* (1900); *Edvard Grieg* (1905); *Massenet and his Operas* (1910).

FINCKENSTEIN, FINCKENSTEIN, KÄBL WILHELM, COUNT FINCK VON (1714-1800). A Prussian statesman. He was a son of Count Albrecht Konrad Finckenstein, field marshal of Prussia and preceptor to the Crown Prince, afterward Frederick the Great. He was educated at Geneva and was Ambassador to Stockholm from 1735 until 1740. Frederick the Great, upon his accession to the throne, sent him as Ambassador to Denmark (1740-42), England (1742-44), and Stockholm (1744-46). He was Ambassador to Russia from 1747 to 1749 and upon his return was appointed member of the cabinet, becoming one of the chief advisers of Frederick, who corresponded with him with great freedom and frankness throughout the Seven Years' War and sent to him the celebrated secret instructions dated Jan. 10, 1757. Until 1763 he conducted the foreign affairs of the kingdom and in June, 1799, celebrated his fiftieth anniversary as Minister.

FIN DE SIÈCLE, fîn de sé-â'kl' (Fr., end of the century). A phrase that became popular in Paris in 1880 and then made its way into the vocabulary of other countries. It was intended to signify that an idea, an object, or what not, was quite up to the latest date and thoroughly characteristic of the hour. When the twentieth century began, the phrase was dropped, and *vingtième siècle* was used in its stead, though this latter phrase had not the vogue of the former.

FINDING (from *find*, AS. *findan*, Icel. *finna*, OHG. *findan*, Ger. *finden*, Goth. *finþan*, to find).

1. A qualified source of title to goods and chattels at common law. It is true the loser is not divested of his title to his goods when they pass by finding into the hands of another: he may reclaim them until his right becomes barred by the statute of limitations; but the finder acquires what is known as a "special property" in them, which is available to him against all the world except the true owner. He may make no use or disposition of them except such as is necessary to preserve them, but he may by appropriate action recover them from any one but the owner who interferes with his possession, even from a subsequent finder. It has been decided that if the property had not been designedly abandoned, and the finder knew who

the owner was or knew that he could have discovered him, he was guilty of larceny in keeping and appropriating the articles to his own use. In the absence of statute the finder has no lien on the property for the expenses incurred by him in caring for it or in seeking to discover the owner, but in some States statutes have been enacted giving him such a lien. As between the owner of premises in which lost or secreted chattels are discovered and the finder, the former has usually the better title. But if the articles are found in a shop, hotel, or other public place, the finder is entitled to them as against the possessor of such place. If goods are improperly withheld by the finder, the common-law remedy of the rightful owner is the action of *detinue* (q.v.); where the finder uses them as his own or disposes of them, he is liable to an action of *trover* (q.v.). In many of the United States statutory remedies have been provided not differing essentially from the common-law procedure. See DERELICT.

2. The technical designation of the formal statement of the conclusion reached by the tribunal trying an issue of fact. It is called a general finding when it disposes of the entire case. If it is a statement of particular facts, to which the law is thereafter to be applied by the court, it is known as a special finding. The refusal of a court or referee to make a finding concerning a material fact with respect to which evidence has been given constitutes an error of law, entitling the injured party to relief from an appellate court. The finding of a court, referee, or jury when the evidence is conflicting is rarely disturbed on appeal; but a finding without any evidence to support it or one clearly against the weight of evidence will be set aside. In the United States the term "findings" is also usually employed to describe the conclusions of law, as well as those of fact, announced by a referee, commissioner to hear and determine, or other subordinate judicial officer to whom issues of law have been submitted for determination. See APPEAL; COURT; JURY; REFERENCE, REFEREE, and authorities cited.

FINDLATER, fin'la-tër, ANDREW (1810-85). An English encyclopædist, born at Aberdour, Aberdeenshire, and educated at the University of Aberdeen. He began his connection with the publishing firm of Messrs. Chambers of Edinburgh in 1853, and subsequently became editor of their *Encyclopædia*, to which he was also a contributor. This work, completed in 1868, was issued in a revised edition under his editorship in 1874. Among the scientific manuals prepared by him for the firm, the handbook on philology is regarded as especially meritorious.

FINDLAY. A city and the county seat of Hancock Co., Ohio, 45 miles by rail south by west of Toledo, on the Blanchard River, and on the Toledo and Ohio Central, the Cincinnati, Hamilton, and Dayton, the Cleveland, Cincinnati, Chicago, and St. Louis, the Lake Erie and Western, the Lake Shore Electric, and the Western Ohio railroads (Map: Ohio, C 3). It is situated in the oil and natural gas fields of Ohio and is surrounded by a rich agricultural country. In the vicinity are beds of clay, building stone, and lime, and deposits of sand and gravel. The manufacturing establishments are numerous and include brick and tile works, machine shops and foundries, boiler, bridge, and target works, sugar and oil refineries, potteries,

lime kilns, and manufactories of automobiles, traction ditchers, electric insulators, gloves, shoes, furniture, carriages, etc. Findlay College (Church of God), opened in 1886, is situated here, and the city contains a public library, city hospital, detention, orphan, and Elks homes, and several fine parks. Settled in 1813, Findlay was first incorporated in 1837. The government, under a charter of 1902, is vested in a mayor, chosen biennially, a city council, and members of public safety and service, the two latter being appointed by the mayor. The city solicitor, auditor, treasurer, and board of education are chosen by popular vote. The water works are owned and operated by the municipality. Pop., 1900, 17,613; 1910, 14,858; 1920, 17,021.

FINDLAY, GEORGE GILLANDERS (1819-). An English Wesleyan scholar and educator, born at Welshpool, Wales. He graduated from Wesley College, Sheffield, the Richmond Theological Institution, and London University (1868). From 1870 to 1874 he was assistant tutor, and after 1881 tutor of New Testament exegesis and classics, at Headingly Theological Institution. During the interim (1874-1881) he had been classical tutor in the Richmond Theological Institution. He is author of volumes on various Epistles of Paul, in *The Expositor's Bible*, *The Expositor's Greek Testament*, and *The Cambridge Greek Testament* (1888, 1892); *The Epistles of the Apostle Paul: Their Origin and Contents* (1892); *The Church of Christ in the New Testament* (1893); *Christian Doctrine and Morals* (1894); *The Books of the Prophets and their Historical Succession* (3 vols., 1896-1907); *The Things Above* (1902); *Fellowship in the Life Eternal*; *An Exposition of the Epistles of St. John* (1909); *Life of William F. Moulton*, the Methodist Scholar (1910). He also contributed largely to biblical encyclopedias and theological journals.

FINDLAY, JOHN RITCHIE (1824-98). A Scottish newspaper proprietor and philanthropist, born at Arbroath, Scotland, and educated at Edinburgh University. He entered the business office of the *Scotsman* in 1842, rising until in 1868 he became a partner with his great-uncle, John Ritchie, who when he died in 1870 left most of his interest in the paper to Findlay. Under the latter's control the prestige and circulation of the *Scotsman* and the wealth of the owner were greatly increased. Much of this money Findlay spent during his lifetime in public benefactions, of which the most notable was the Scottish National Portrait Gallery in Edinburgh, which cost £70,000 and was opened in 1889.

FINE (OF., Fr. *fin*, from Lat. *finis*, end, supplementary payment, fine). A form of conveyance of lands at common law through the medium of a fictitious suit, employed in cases where an ordinary conveyance would not have the effect of vesting the full estate intended to be conveyed. It was for centuries the favorite method of "barring an entail," i.e., of enabling a tenant in tail to transform his limited fee into an absolute fee simple, and thus bar the heirs of his body and the reversioner or remainderman of his interest in the estate. See DE DONIS; FEE TAIL.

A fine is defined by Coke as "an amicable composition and final agreement by leave and license of the King or his justices"; and it was called a fine because it put a termination

(*finis*) to all litigation between the parties, and those claiming through them, in regard to all matters touching the suit. The proceedings in a fine were shortly as follows: The party to whom the land was to be conveyed commenced a fictitious suit against the vendor. But the case was no sooner in court than the plaintiff asked leave to agree or settle with the defendant. This leave having been obtained, a covenant was entered into whereby the vendor or defendant, called the *cognizor*, recognized the right of the plaintiff, called the *cognizee*, to the lands, of which he admitted that the plaintiff was wrongfully kept from the possession. These proceedings, which at first were real, were afterward adopted universally without having a shadow of foundation in fact. The solemn farce having been completed, a *note* of the fine, being an abstract of the covenant, the names of the parties, and the parcels of the land, was entered on the rolls of the court; and the business was concluded by what was called the *foot* of the fine, setting forth the parties, the time and place of agreement, and before whom the fine was levied. The whole was embodied in indentures commencing *hæc est finalis concordia*. It was necessary that a fine should be levied openly in the Court of Common Pleas, or before the Chief Justice of that court, or before two or more commissioners, duly appointed. In order that a fine should have full effect, it was required to be levied with *proclamation*, i.e., open proclamation of the transaction in court.

A fine so levied cut off the right even of strangers who failed to assert their claim during the period allowed by law; hence an estate was said to be barred by fine and nonclaim. A fine levied by a married woman had the effect of cutting off all right she might have in the lands and was the only mode by which a married woman could convey her lands or her dower right in her husband's lands. Like the feoffment and the common recovery (q.v.), a fine was known as a tortious conveyance; i.e., it had the extraordinary operation of conveying whatever estate it purported to convey, irrespective of whether the vendor was seised of the estate conveyed or had any right to transfer it. The effect of such a tortious conveyance was to vest a defeasible title in the vendee, leaving the person entitled to the possession to pursue his remedy by entry or appropriate action.

The practice of conveying lands by fine, as well as the process of common recovery, was abolished by the Fines and Recoveries Act, 3 and 4 Wm. IV, c. 74. Both of these modes of conveyance were in use in the Colonial period of American history, but have become obsolete or have been abolished by statute. The fine was recognized and confirmed by legislative act in New York and was not done away with until 1830. See CONVEYANCE.

FINE. In criminal law, a pecuniary mulct or punishment imposed by a competent court upon an offender convicted of a crime or misdemeanor. The term came into use in England during the reign of Edward I, when it became common for a court to sentence a culprit to a short term of imprisonment and then to allow him to "make fine," i.e., to make an end (*finem facere*) to his imprisonment by paying into court a certain sum of money. At the outset this was considered a sort of bargain to end his imprisonment, and not as an infliction of a pecuniary penalty, as the judges desired to avoid

the possibility of the practice being confused with that of amercement (q.v.), which must be fixed by the assessment of the offender's peers.

The practice of allowing a culprit convicted of a trivial offense thus to have his option of fine or imprisonment still prevails in our criminal jurisprudence. This is true especially in the punishment of misdemeanors, the penal statutes usually prescribing as the punishment a short term of imprisonment or a moderate fine or both, in the discretion of the court. In the less aggravated cases the magistrates usually impose the fine only, or give the misdemeanor the option of fine or imprisonment; but where a fine is imposed, if the culprit is unable to pay, he is remanded to prison, and a certain amount of his fine is considered as discharged for each day of confinement. For example, in New York if a magistrate imposes a fine of \$10, on default of payment the culprit is confined in a penal institution for 10 days, his fine being considered as reduced \$1 each day. It is provided in the United States Constitution (Eighth Amendment) that "excessive bail shall not be required nor excessive fines imposed." This does not set any definite limitation on the power of Congress to impose such pecuniary penalties as may seem expedient, but it affords grounds for attacking the constitutionality of a statute which seems oppressive in this particular and thus makes the legislative act subject to review by the courts. Most of the States have inserted similar provisions in their constitutions. See AMERCEMENT; FORFEITURE; PENALTY.

FINE, HENRY BURCHARD (1858-). An American university dean and mathematician. He was born at Chambersburg, Pa., and was educated at Princeton (A.B., 1880) and Leipzig (Ph.D., 1885) universities. At the former institution he was assistant professor from 1885 to 1890, when he became professor, and he was also dean of the faculty in 1903-12 and dean of the department of science after 1909. He was president of the American Mathematical Society in 1911-12. Besides papers on mathematical subjects, he is author of *Euclid's Elements* (1891); *The Number System of Algebra* (1891; 2d ed., 1903); *A College Algebra* (1904); *Coordinate Geometry*, with Henry Dallas Thompson (1909).

FINE, fën, or FINÉ, fëná', ORONCE. See ORONTIUS FINEUS.

FINE-EAR. A servant of Fortunio, in the fairy tale *Fortunio*, who could hear the grass or a sheep's wool grow.

FINETTA. A fairy tale, by the Comtesse d'Aulnoy (1682). It is only a slightly altered version of *Cinderella*.

FINGAL, fín'gál. The name of the hero in Macpherson's *Poems of Ossian*. (See MACPHERSON, JAMES.) It represents an original Gaelic *Fionn Gaidheal* (Fin the Gael) and appeared as *Fionnghael* in the 1763 edition of *Temora*. But in the collected edition of Macpherson's Gaelic texts (1807) the spelling is regularly *Fionnghal*. In all genuine Ossianic literature the name of the leader is simply *Fionn* (earlier *Finn*), but this regular form occurs very rarely in Macpherson. Consult Macpherson, *Poems of Ossian*, with an historical and critical introduction by J. Eyre-Todd (London, 1906).

FINGAL. Another, but unauthorized, name for the Gaelic hero Fionn Maccumhail (q.v.).

FINGAL'S CAVE. See STAFFA.

FINGER. See HAND.

FINGER-AND-TOE DISEASE. See CLUB-ROOT.

FINGER BOARD (AS. *finger*, Icel. *fingr*, Goth. *figgrs*, OHG. *finar*, Ger. *Finger*, finger + board). In stringed musical instruments, the thin strip of wood glued upon the neck, above which the strings are stretched and on which the player presses his finger when shortening the strings. At its lower end the finger board projects over the sounding board of all instruments played with the bow, but in other varieties, as in the guitar, it is glued down on both neck and sounding board. In some stringed instruments plucked with the fingers the finger board is divided by frets to enable the player more readily to find the correct pitch. See KEYBOARD.

FINGERING. In music, the method of applying the fingers to the keys, holes, strings, etc., of musical instruments. The simplest fingering is upon the brass wind instruments, whose keys are so few that they can be manipulated by one hand without change of position. The wood-wind instruments come next in order of difficulty, various functions being assigned to each finger, and sometimes the same key being pressed by different fingers. For the fingering of stringed instruments, such as the violin, see POSITION. The most complicated fingering, however, is on instruments having keyboards. The method of notation for fingering used at present on the pianoforte in which the thumb is marked 1, and the fingers 2, 3, 4, 5, is the outcome of a long series of experiments, prominent among the reformers being Bach, Liszt, Tausig, and Bülow. The English system, in which the thumb was marked x and the fingers 1, 2, 3, 4, has practically been abandoned. Consult: Whittingham, *Companion to all Instruction Books for Keyed Instruments* (London); Ch. Neate, *An Essay on Fingering* (ib., 1855); O. Klauwell, *Der Fingersatz des Klavierspiels* (Leipzig, 1885). See also articles on the various instruments.

FINGER PRINTS. The patterns composed by the papillary ridges on the palms of the hands and soles of the feet possess two characteristics that adapt them peculiarly to the requirements of personal identification—persistence in general character through life, and wide variation as between individuals. These characteristics are especially marked in the case of the patterns of the fingers. Recognition of this fact has led to a widespread advocacy among men of science of the practice of obtaining and preserving impressions of the finger patterns of persons whom it may later be necessary to identify with certainty. Among the proposed applications of the finger print the one of greatest general interest is its use as a means of criminal identification. Low as are the chances of error under the Bertillon system (q.v.), they are not altogether wanting. By supplementing the Bertillon measurements with records of finger prints identification can be made certain. The use of finger prints as a means of identification of soldiers has been proposed and in some cases has been practiced. Another application of importance is as a substitute for the signature on legal documents or as a supplement to such signature. The use of the finger print renders forgery impossible; furthermore, it offers a means for securing authentic evidence of the personal cooperation of an illiterate in the

execution of documents in his name. A number of financial institutions, both in the United States and in other countries, have experimented with the use of finger prints with satisfactory results, although without gains sufficiently striking to secure the wide acceptance of the plan.

The most spectacular application of finger-print methods is to the detection of crime. In the course of the commission of a crime the criminal may accidentally leave an imprint of his fingers upon some object on the spot—e.g., a windowpane, a knife blade. Such an imprint, if identical with the finger print of a suspect, offers almost irrefutable evidence at least of complicity. In rare instances such evidence has been offered in court, although convictions secured upon it fall, for the most part, in the realm of romance. In the nature of the case sufficiently clear imprints are seldom found and, in the absence of a general finger-print record, will seldom serve for the detection of a criminal upon whom the suspicion of guilt is not already securely fixed.

As an alternative to the Bertillon system the chief difficulty with the finger print consists in classification. Sir Francis Galton (*Finger Prints*, 1892) finds nine chief classes, or genera, with a large number of subordinate classes, or species. No two investigators, however, would agree precisely in assigning prints to species or even genera. Accordingly most criminologists reject the proposal to employ the finger print exclusively for identification, although they recognize its value in combination with other systems. Consult: L. R. Almandos, *Dactiloscopia argentina, su historia e influencia en la legislación* (La Plata, 1900); L. Seymour, *Fingerprint Classification* (Los Angeles, 1912); F. A. Brayley, *The Arrangement of Fingerprints Identification and their Uses* (Boston, 1913).

FINGER SPONGE. See GLOVE SPONGE.

FINGER SYMBOLISM. A representation of numbers known to the ancients and common in the Middle Ages. Since only one number could conveniently be represented at one time upon the abacus (q.v.), it is possible that the finger symbolism was invented to enable the calculator to hold in mind the numbers with which he was working. It is also probable that the subject was of practical value in bargaining at international fairs in the mediæval period. Nicolaus Rhabdas of Smyrna, a mediæval Greek (fourteenth century), describes the finger symbolism in use in his time and long before; thus, 80 was represented by laying the thumb of the left hand upon the palm, bending the forefinger closely over the first joint of the thumb, and slightly bending the remaining fingers. Consult Tannery, *Notice sur les deux lettres arithmétiques de Nicolas Rhabdas* (Paris, 1886), and Gow, *History of Greek Mathematics* (Cambridge, 1884). For the work of Rhabdas, consult *Notices et extraits des manuscrits de la Bibliothèque Nationale*, vol. xxxii (Paris, 1886).

FINIAL (from Lat. *finis*, end). A terminal carved ornament at the summit of a peak, pinnacle, gable, spire, or other pointed structure. Finials are found in Greek architecture, as in the exquisite choragic monument of Lysicrates and other works of similar form, and in nearly all subsequent styles. In Christian architecture, after the eleventh century, finials took on increasing importance with the development of steep roofs, high pointed gables, and especially

of the spires and pinnacles of Gothic buildings. During the latter part of the twelfth century and the whole of the thirteenth century finials of the most perfect form and of infinite variety were used as the crowning ornaments of every salient point in the buildings of the period. Conventional foliage forms, usually in the form of crockets, were grouped around a central stem ending in a knob, bud, or flower. The architects of the fourteenth century in the finials, as in other ornaments, imitated more closely the forms of natural foliage, with greater richness but less vigor of outline than those of the preceding century. In the late Gothic of the fifteenth and sixteenth centuries the finials were made longer and more attenuated and were used to terminate the ogee drip moldings over arches as ornaments in relief on the walls as well as to terminate pinnacles and gables. Finials were carved both in stone and in wood, and in the latter material with great delicacy and minuteness. The English developed beautiful finials for the tops of wooden pew ends, especially in the fifteenth century. Finials at the points of hipped roofs, called hip knobs, were often of copper or lead, sometimes of terra cotta or of wood; and whatever the material adopted, its natural capabilities were made a source of special beauty. In Renaissance architecture finials were much less important, as steep roofs, pinnacles, and high-pointed gables passed out of use, except in transitional or early works, as in the Francis I style, which produced beautiful finials based on Roman candelabrum types. Knoblike and turned finials are common in both Renaissance and modern furniture. In Elizabethan architecture finials are almost entirely of a geometric form and without foliage, and are frequently, especially when terminating wooden gables, combinations of finial and vane, partly wood and partly iron. In the strict classic the only traces of the finial are in the balls, obelisks, etc., used as terminations and also in the shields and supporters (themselves a remnant of feudalism) which form the crowning ornament of gate piers, pedestals, etc., and which really correspond more closely to the ancient anthemion terminations. Mohammedan finials on minarets and domes are usually of metal, with balls or other swelling forms surmounted by the crescent.

FINIGUERRA, fē'n-gwēr'ra, MASO (TOM-MASO) (1426-64). A Florentine goldsmith, draftsman, and engraver of the Renaissance. He was born of a family of goldsmiths and was probably a pupil of his father Antonio. It was formerly supposed, on the authority of the sculptor Baccio Bandinelli (q.v.), that he assisted Ghiberti on the famous portals of the baptistery; but there is no confirmation of this. The chief influence upon his art was probably that of Antonio Pollajuolo, with whom he was in partnership in 1457. In 1463 he designed cartoons for the five figures in tarsia which were carried out under the supervision of Giuliano da Majano for the sacristy of the cathedral—his only authenticated surviving work. He made his testament Dec. 14, 1464, and died shortly afterward. According to the statement of Benvenuto Cellini (q.v.), certainly an authority on the subject, he was the first master of his day in the art of niello engraving. Now we know from the records that he executed important work in this medium. His masterpiece was a "pax" of the "Crucifixion" for the

baptistery of Florence. Finiguerra was long esteemed, on the authority of Vasari, the inventor of engraving on metal; but this statement is no longer credited, since it is certain that line engraving (q.v.) was practiced in Germany before his day. It seems likely, however, that a number of drawings of the school of the Pollajuoli in the Uffizi, and part of a picture chronicle in the British Museum, are by him. Consult: Duchesne, *Essai sur les nielles* (Paris, 1824); Baldinucci, *Notizie dei professori di disegno* (Florence, 1845); Colvin, *A Florentine Picture Chronicle* (London, 1898).

FINING (from *fine*, OEng. *finen*, to refine, from *fine*, pure, from OF., Fr. *fin*, from Lat. *finitus*, p.p. of *finire*, to end, from *finis*, end), or **CLARIFICATION**. The process by which turbid liquors such as beer or wine are clarified or made clear. The simplest method of fining is by passing a liquid through a porous substance, such as charcoal, a cloth, or filtering paper, which retains the solids and allows the clear fluid to pass through; but this method can be used only with those liquids that contain matter that is mechanically suspended in them. Such liquids as contain mucilaginous or other gummy matter that readily clogs the filter require special means of separation. The fact that the albumen of meat collects the mucilaginous material in soup has been taken advantage of for the purpose of fining.

In the fining of sirups and such liquors as may be heated without injury, a soluble albumen such as the white of egg may be used. To a small portion of the turbid liquid albumen is added, and after thorough mixture the portion is poured into the rest of the liquor and agitated. On the application of heat the albumen coagulates and contracts into scum that envelops and draws together the suspended matter, which may then be readily removed. As albumen is coagulated by alcohol, it may be used for fining wines and cordials without the application of heat. Malt liquors, on the other hand, are fined by means of gelatin, as isinglass. Thus, one pound of isinglass may be soaked in three or four pints of water or sour beer to which, as the isinglass swells, more sour liquor is added, until it measures a gallon. The resulting jelly is then dissolved in seven or eight gallons of liquor to be fined, and this solution, called "brewer's finings," which has the consistency of sirup, is used in the proportion of a pint to a pint and a half to a barrel of ale or porter or to a hoghead of wine. The isinglass combines with the astringent matter of the liquor, forming an insoluble solid which sinks to the bottom and carries with it the suspended matter, where it is allowed to remain, as the flavor of malt liquors depends somewhat upon the astringents they contain. For the fining of spirits a proper proportion of alum is added to the liquor and then a solution of sodium carbonate, and after agitation in the presence of air the spirit is allowed to rest for 24 hours, after which it will be found to be clarified. Frequently salts are used for fining; thus, acetate of lead is sometimes added to the liquor, and then, after thorough agitation, a solution of potassium sulphate. In this case an insoluble lead sulphate is precipitated, which carries down with it the gummy material. This process is objectionable, as lead salts are poisonous. Ox blood is sometimes used as a substitute for albumen. The best liquors need no artificial

fining, as they clarify themselves, for the turbid matter sinks to the bottom soon after the fermentation is completed, and much care must be exercised in the use of finings, especially in cases where the liquors require a certain amount of astringency, briskness, and piquancy, as these qualities are diminished and the liquor is likely to become flat and vapid. Those liquors which fail to become clear when treated with finings in the usual manner are called "stubborn." Consult Gardner, *Brewer, Distiller, and Wine Manufacturer* (London, 1883).

FINISTÈRE, fè'nè'stâr' (Lat., *finis terræ*, land's end). The westernmost department of France (q.v.), comprehending a part of the former Duchy of Brittany (Map: France, N., B 4). Area, 2714 square miles. Pop., 1901, 773,014; 1911, 809,771. It is traversed from east to west by two low, picturesque chains of hills. Its coast is rugged and broken, its shores bristling with dangerous granite rocks and fringed with many islands. The soil, one-third of which is occupied by sandy tracts and marshes, is moderately productive. Corn, hemp, and flax are grown in considerable quantities, as well as fruits. On the coast are large pilchard fisheries. The silver and lead mines are valuable, those of Poullaouen and Huelgoat being about the richest in France. Capital, Quimper. Brest is the chief harbor.

FINISTER MOUNTAINS. A range of mountains in Kaiser Wilhelms Land. They reach an altitude of 11,315 feet.

FINISTERRE, fè'nè'stâr', CAPE. See CAPE FINISTERRE.

FINK, ALBERT (1827-97). An American civil engineer, born near Frankfort-on-the-Main, Germany. Graduating from the Polytechnic Institute (Darmstadt) in 1848, he emigrated in the following year to America, where he became a draftsman for the Baltimore and Ohio Railroad; subsequently he had charge of designing and constructing for that company the first important iron bridges in the United States. In 1857 he became an assistant to George McLeod, chief engineer of the Louisville and Nashville Railroad, and while thus connected he built the great bridge over the Ohio River at Louisville, Ky. During the Civil War he was chief engineer and superintendent of the road and machinery department of the Federal army. In 1865-75 he was general manager and in 1870-75 vice president of the Louisville and Nashville Railroad. In 1875 he organized the Southern Railway and Steamship Association, by means of which he effected a "pool" of four great trunk lines and thus revolutionized the traffic management of American railroads. In 1879-80 he was president of the American Society of Civil Engineers.

FINK, LOUIS MARIA (1834-1904). An American Catholic prelate, born at Triftersberg, Bavaria. He was educated at Ratisbon, came to the United States in 1852, was ordained priest in 1857, and was stationed at Bellefonte, Pa., Newark, N. J., Covington, Ky., and Chicago, Ill. In 1871 he was consecrated titular Bishop of Eucarpia and appointed coadjutor to Bishop Miege, Vicar Apostolic of Kansas. He was transferred to the diocese of Leavenworth in 1877.

FINLAND (Fin. *Suomenmaa*, land of lakes and marshes). A grand duchy of Russia, extending from about lat. 60° to about 70° N., and lying between long. 20° 30' and 33° E.

(Map: Russia, C 2). Its extreme length is 700 miles from north to south. The greatest breadth is about 400 miles. Finland is bordered on the north by Norwegian Lapland, on the east by Russia proper, on the south by the Gulf of Finland, and on the west by the Gulf of Bothnia and Sweden. It includes part of Russian Lapland. It has an area of 144,255 square miles, of which about 35 per cent is forest (including many moors and morasses), over 11 per cent is occupied by lakes, about 3 per cent is arable, and about 5 per cent is in meadow. Finland has been called the "Land of the Thousand Lakes." Among its largest lakes are Kallua, Päijänne, Enare, Torned, Hauki, and Saima. The last of these, about 180 miles long, is the centre of the system of water communication between the central part of the country and the Gulf of Finland. Lake Ladoga indents the southeast corner. While heights, even to 4100 feet, as in Haldisekk, are reached in the extreme north, the most of Finland contains no mountainous elevations and all reliefs have been rounded off in the south to 400 to 600 feet by the action of an ancient ice sheet. The forms of the country everywhere are due to this glaciation; boulders, many of them so large that the peasants build houses in their shelter; lakes, lagoons, and marshes, the labyrinth of waterways, and the general alignment of the country as marked by hills and valleys. The rivers are unimportant, the chief being the Muonio, which flows between Finland and Sweden, the Kemi, and the Uleä. The coast line is generally low, skirted in the south by numerous rocky islands.

The crown forests are extensive, yielding the government a considerable income. The forest trees are mainly conifers. Oaks and other broad-leaf trees are found in the southern portion. In the northern section the vegetation is that of the Arctic tundras. The chief mammals are bears, wolves, lynxes, gluttons, foxes, elk, and reindeer. Game birds and waterfowl abound, as well as fish, principally herring and salmon.

Climate. The climate of Finland is rigorous but healthful, marked by long winters and short but hot summers. It lies within the zone of cyclones and anticyclones, which pass over northern Europe from west to east at intervals of two or three days throughout the year and give variability to the winds and weather. The mean annual temperature varies between the southern and the northern boundary from 40° F. to 34° F., ranging from 20° F. to 8° F. in January, and from 64° F. to 62° F. in July. The extreme range of temperature is about 110° to 115° F. The prevailing winds in winter are from the south and southwest and in summer from the north, northwest, and west. The amount of rainfall varies from 10 inches in the northern to 25 inches in the southern part, being greatest during August. The degree of cloudiness varies from 50 per cent at the south to 72 per cent at the north.

Geology and Mineral Resources. In its geological structure Finland is closely related to the Scandinavian peninsula. Granite and Archean rocks predominate, overlain by glacial materials. The granite is extensively quarried for building stone. Bog-iron ore and copper are the only metallic minerals of importance. The former occurs in marshes and in the numerous lakes, while the copper mines are located at Pikaranta on Lake Ladoga.

Agriculture. Owing to its situation and to

the very limited cultivable area as well as to the primitive methods employed, Finland's home supply of agricultural products falls far short of the demand. In 1901 the number of farms was 271,154, of which 1855 embraced over 247 acres each. There is a large class of small-farm owners in areas ranging from 10 to 25 acres. The influence of the landed aristocracy as a class, once considerable, has greatly waned since the Law of 1863-64, which enables every citizen to buy tax-exempted land from the nobility. The state owns about one-third of the whole area and rents land on very advantageous terms, giving lessees every reasonable opportunity for purchase. Rent of private lands is paid mostly in labor. Though the laws governing the relations between tenant and landlord leave much to be desired, the condition of tenants was perhaps better during the last century than that of the average in the countries of Europe. After Finland became a Russian duchy, its agriculture underwent a significant change. Owing to the excess of pasture over arable land, the dairying industry has always been more or less important, but prior to 1850 agriculture in Finland meant chiefly the raising of rye, corn, oats, barley, and potatoes. Since then dairy products have become more prominent, and the use of machinery in their production, introduced by the example of owners of the larger estates and followed by the coöperative societies, is now very general. The wheat crop of 1910 was approximately 130,000,000 bushels; rye, 13,000,000; oats, 28,000,000; potatoes, 25,000,000. Finland exports annually about \$8,000,000 of animal products, chiefly butter. In the development of its fisheries as well as of its live-stock interests the country has greatly advanced.

Manufactures. Naturally Finland is not favorably situated for manufacturing, although the numerous streams offer an abundant supply of power. During the period of 1887-1902, however, the number of manufacturing establishments grew from 5615 to 8534 (52 per cent gain); the number of workmen employed increased from 43,085 to 95,282 (121 per cent); and the value of products, exclusive of flour, rose from about \$22,500,000 to about \$59,800,000 (161 per cent). In 1910 the product of the wood industries was valued at \$28,000,000; textiles, \$13,000,000; paper, \$18,000,000; iron and mechanical works, \$10,000,000.

Commerce and Transportation. Respecting commerce Finland has been practically independent of Russia. The Finnish manufacturer gets his material much cheaper than the Russian, hence has been able to compete with the latter even in the Russian market. The great difference between the prices on certain manufactures in Finland and in Russia has led to extensive smuggling. These difficulties, however, were somewhat obviated after a measure was instituted by the Czar in 1897, which provided that all articles of Russian origin, except spirits, sugar, salt, tobacco, and beer, were to be admitted free to Finland; all agricultural and handmade articles from Finland were to be passed free into Russia; all products of the principal industries were to be liable to differential duties; the remainder were to be treated in the same way as foreign products. Finland's annual imports increased from \$28,120,000 in 1890 to \$91,500,000 in 1911, and its exports from \$18,480,000 to \$62,180,000. The imports comprise chiefly foodstuffs, metal prod-

ucts, textiles, and machinery. About 15 per cent of the exports consist of animal products, mostly butter, and about 70 per cent of wood and wood products, including paper and pulp. Timber is the leading export and amounted in 1912 to \$32,038,000; paper and wood pulp, \$12,352,000; butter, \$6,750,000. The trade is mainly with Russia, Germany, Great Britain, Denmark, and Sweden, named in the order of their importance. The transportation facilities are fully adequate to the demands of the country. Its even surface greatly facilitates the construction of common roads, of which there are over 30,000 miles. The numerous lakes are utilized freely for transportation, and, joined by short canals, they afford continuous waterways. The first railway in Finland was completed in 1862—a line of about 88 miles between Helsingfors and Tavastehus. In 1911 there were 2,332 miles, of which only 182 miles were owned by private companies. The income of the state lines forms an important item in the budget.

Finance and Banking. The revenues of Finland amounted in 1911 to about \$31,200,000, and the expenditures \$30,100,000. The largest expenditures were for public works (mainly railroads), administration and service of the debt, worship and education, and military affairs. The public debt, contracted exclusively for railway construction, amounted at the beginning of 1911 to about \$34,000,000. Finland has a gold standard, and the unit of value is the mark, or markka, equivalent to 19.3 cents, the same as the French franc. The chief financial concern is the Bank of Finland, a state institution established in 1811, and by means of which most of the financial undertakings of the state are carried out. The first savings bank was established in 1823. In 1911 there were altogether 382 savings banks, mostly private, but under the supervision of the state, with 308,939 depositors, and deposits amounting to \$48,700,000.

Government. The position of Finland in the Russian Empire is that of a grand duchy, with its own constitution, and practical autonomy in its internal affairs, all diplomatic relations, however, being carried on by the Empire. The executive department consists of the Senate (which meets at Helsingfors), whose members are nominated by the Emperor (the Grand Duke of Finland), the Governor-General, and the State's Secretariat for Finland at St. Petersburg. The national Diet was formerly composed of nobles, clergy, burghers, and peasants, but was reorganized in 1906 to consist of one chamber of 200 members chosen by direct and proportional election, in which all entitled to suffrage have an equal vote. The suffrage is possessed by both sexes alike, on reaching the age of 24, and both sexes are eligible to the Diet; and the first election resulted in the selection of 19 women as members of the Diet. The Diet has power to consider and act upon all matters not affecting fundamental laws or the organization of land and sea defense. In 1910, however, the Russian government enacted a law depriving the Diet of the right to legislate on taxation, police direction, school management, and control of the press, and in 1911 the Russian Duma enacted a law placing Russians on an equality with Finns in the grand duchy. (See *History*, below.) The Finnish army, according to the provisions of the Defense Law

of 1878, could not be required to serve outside of Finland and is under the command of Finnish officers.

Population and Religion. The population of Finland numbered 2,060,782 in 1880, 2,712,562 in 1900, 2,857,038 in 1904, and 3,154,284 in 1911. Estimated population, Dec. 31, 1919, 3,335,237. The females exceeded the males in 1904 by 22,580, and the urban population formed only about 13 per cent of the total. The chief cities and their populations (1910) are: Helsingfors (the capital), 147,218; Abo, 49,691; Tammerfors, 45,442; and Viborg, 27,508. As regards religion in 1910 there were 3,057,627 Lutherans, 52,004 Greek Orthodox. The language of the country is Finnish, although Swedish is spoken by the higher classes, in addition to the Swedes, who form about 13 per cent of the population. The Russians number but a few thousand. See FINNS.

The University of Helsingfors is at the head of the Finnish educational scheme. It was founded at Abo in 1640 and transferred to Helsingfors in 1827. In 1912 it had an attendance of 3030, of whom 730 were women. There were 69 lycæums in 1912. Primary instruction is furnished by public, parochial, and traveling schools. According to the school census of 1896, out of 457,678 children of school age only 17,771 received no education. The public schools are maintained largely by local funds, but receive a subvention from the government. Finland has a large number of periodicals and not a few learned societies.

History. The Finns are said to have dwelt on the Volga in the seventh century and to have been driven northward at the beginning of the eighth. The true Finns call themselves Suomi. In the twelfth century the Swedes began the long struggle which ended in the closing years of the thirteenth century in the Christianization of the people and their subjection to Swedish sovereignty. Henrik, the English-born Bishop of Upsala, who accompanied the first Swedish expedition in 1157, was murdered by a Finn and became Finland's patron saint and martyr. For over 500 years Finland remained an appanage of the Swedish crown. Gustavus Vasa (q.v.) introduced the Lutheran religion in 1528, and John III made the country a grand duchy. Under Swedish rule the people enjoyed an autonomous constitutional government and developed a simple, intelligent, and unique civilization. While Finnish remained the language of the peasantry, Swedish became that of the towns and of the cultivated and official classes. During the long wars between Russia and Sweden, Finland was frequently a battle ground, and as the Finnish frontier is only 33 miles from St. Petersburg, it was naturally desired by the former country to round out its territory and complete its defenses. This desire was realized in the Peace of Fredrikshamn, Sept. 17, 1809, following upon a Russian invasion, by which Sweden ceded the grand duchy with the Åland Islands to Russia. Alexander I (q.v.) guaranteed to Finland the preservation of its laws, constitution, and religion, and this pledge was solemnly renewed to the Finnish Diet by every Czar including Nicholas II. In 1897, however, the Russian government began a series of systematic attacks, culminating in the attack on Finnish liberties and the manifesto of Feb. 15, 1899, which removed from the competence of the Diet all matters affecting the grand duchy in common with Rus-

sia proper. The Russification of the country was carried on under the auspices of the notorious Plehve, who was made Secretary for Finland in 1899. Between 1900 and 1902 the incorporation of the Finnish army was decreed, Russian was made the language of higher administration and of the Senate, and Russian subjects were made eligible for service under the government. Finally, the Governor-General, Bobrikoff, was invested with dictatorial powers (April 15, 1903) and proceeded to suppress freedom of assembly and the press and to exile the most prominent leaders of the opposition. On June 16, 1904, Bobrikoff was assassinated. He was succeeded by Prince Obolenski. The revolutionary agitation in Russia (1905) found no echo in Finland in the beginning; even the creation of a state Duma for Russia was regarded as not affecting the peculiar status of Finland under its own Diet. On October 30, however, the workmen at Helsingfors decided to join in the general strike which was raging in Russia. A tremendous public upheaval followed, which in one day, and without recourse to arms, succeeded in sweeping away the work of Russian aggression during the previous eight years. On October 31 a deputation presented to Prince Obolenski a series of popular demands, including the repeal of all illegal ordinances and the immediate convocation of the Diet. These demands Prince Obolenski promptly granted. On November 4 the Czar signed a manifesto summoning an extraordinary meeting of the Diet on December 20. This was followed by absolute quiet in Finland. On May 29, 1906, the Diet adopted a radical system of representation. See GOVERNMENT. Finland proclaimed her independence Dec. 9, 1917, and established a Republic. Her independence was recognized by practically all the European powers immediately and by the Russian Soviet government on Jan. 9, 1918. Civil war immediately broke out between the red guards (Bolshevik) and the white guards (pro-German). Throughout the year the German influence was predominant. In July, 1919, however, Professor K. J. Stahlberg, a strong Finnish nationalist was elected president of the Republic over General Mannerheim, his pro-German opponent, as a result of a bloc formed by Socialists, Agrarians, and Progressives. The German influence was largely wiped out and Finland began her career as a really independent state. See SUPPLEMENT.

FINLAND, GULF OF. An arm of the Baltic Sea bounded by Finland on the north and east, the Government of St. Petersburg on the east and south, and Esthonia on the south (Map: Russia, B 3). It extends in an easterly direction for over 250 miles and varies in width from about 12 to over 80 miles, its narrowest point being at the east end. Its depth ranges from 26 to over 200 feet, although in a few places it exceeds 300 feet. The north coast is rugged and bordered with numerous small islands. There are also islands, mostly uninhabited, in the midst of the gulf. By the Neva and the Ladoga Canal the gulf is connected with the lakes of Ladoga and Onega, while the Narova connects it with Lake Peipus. Besides the two above-mentioned rivers, the gulf receives a number of small streams, both from Finland and from Esthonia. Navigation is greatly hindered by sand banks and rocks, and by ice during the winter. Among the ports are Reval, Kronstadt, on a powerfully fortified island protecting the Neva, Viborg, and Helsingfors.

FINLAY, GEORGE (1799-1875). An English historian, born at Faversham (Kent). He studied law in an office at Glasgow and Roman jurisprudence at Göttingen. In 1823 he proceeded to Greece, met Byron, went to Missolonghi, but soon left for Italy and thence for Scotland, where he concluded his legal studies and passed his civil-law examination. In 1826 he was once more in Greece and from that time until the termination of the war (1829) was either in active military service or employed in missions on behalf of the patriot cause. He then bought an estate in Attica and devoted himself to agriculture and writing history. Among his works are *Greece Under the Romans* (1844); *A History of the Byzantine and Greek Empires from 716 to 1453* (1854); *Greece under Ottoman and Venetian Domination* (1856) and *Greek Revolution* (1861). These, with manuscript corrections and additions by the author, were published at Oxford under the editorship of H. F. Tozer as *A History of Greece, from its Conquest by the Romans to the Present Time, 146 B.C. to 1864 A.D.* (1877). Consult the *Autobiography* in vol. i of the Oxford edition.

FINLEY, JAMES BRADLEY (1781-1856). An American Methodist Episcopal clergyman, born in North Carolina. He entered the ministry in 1809; was for six years superintendent of the mission to the Wyandot Indians, for three and a half years chaplain of the Ohio penitentiary, and for 21 years presiding elder; and was a member of eight general conferences. He was author of *The History of the Wyandot Mission* (1842); *Life Among the Indians*, ed. by D. W. Clark; *Sketches of Western Methodism*, ed. by W. P. Strickland. Consult his *Autobiography*, ed. by W. P. Strickland (Cincinnati, 1854; 2d ed., 1857).

FINLEY, JOHN HUSTON (1863-). An American educator and editor. He was born at Grand Ridge, Ill., studied at Knox College (A.B., 1887) and at Johns Hopkins University, and became secretary of the New York State Charities Aid Association. He was president of Knox College from 1892 until 1899, editor of *Harper's Weekly* (1899), and editor of *McClure's*

Magazine (1899-1900). In 1900 he became professor of politics in Princeton University, in 1903 president of the College of the City of New York, and in 1913 New York State Commissioner of Education. He was Harvard University exchange lecturer on the Hyde Foundation at the Sorbonne, Paris, in 1910-11, served as president of the American Social Science Association after 1910, became a member of the National Institute of Arts and Letters, and received the degree of LL.D. from several colleges and universities (including Columbia, 1914). He wrote: *Taxation in American States and Cities*, with Richard T. Ely (1889); *The American Executive and Executive Methods*, with John F. Sanderson (1908).

FINLEY, JOHN PARK (1854-). An American meteorologist, born at Ann Arbor, Michigan. He graduated at the State Normal School at Ann Arbor and continued his studies at the Michigan State Agricultural College. As assistant to the chief signal officer at Washington, he instituted the system of meteorological reports from localities where there were no regular signal-service officers by means of volunteer observers. He was later placed in charge of the Signal Service Bureau on the Pacific coast, where his observations were of great value. His writings are extensive, his investigations regarding the phenomena of tornadoes being his most valuable contribution to meteorology. Among his published works are: *Tornadoes* (1887); *Manual of Instruction in Optical Telegraphy* (1889); *Sailor's Handbook of Storm-Track, Fog, and Ice Charts of the North Atlantic and Gulf of Mexico* (1889); *Essay on the Development of Tornadoes* (1890); *Certain Climatic Features of the Two Dakotas* (1893).

FINLEY, MARTHA (MARTIA FARQUHARSON) (1828-1900). An American author. She was born in Chillicothe, Ohio, lived for many years in Philadelphia, and became widely known for her numerous stories of the Sunday School Library type. Her "Elsie Series" (26 vols.), "Mildred Series" (7 vols.), and "Finley Series" (7 vols.) for adults, and many Sunday-school books, including the "Do-Good Library" (9 vols.) and the "Pewit's Nest Series" (12 vols.), were very popular. Among her many other publications are *An Old-Fashioned Boy* (1871) and *The Thorn in the Nest* (1886).

FINLEY, ROBERT (1772-1817). The organizer of the Colonization Society, born at Princeton, N. J. He graduated at the college in his native town at the age of 15 years and taught school there, in Allentown, N. J., and in Charleston, S. C. In 1794, having returned North, he was licensed as a minister by the Presbytery of New Brunswick, N. J., and in 1795 accepted a call to Basking Ridge, N. J. From a study of the negro question he came to the conclusion that the only solution of the problem was to colonize these people in some remote region, preferably on the coast of Africa. In December, 1816, he went to Washington, D. C., where he organized the Colonization Society (q.v.), and among those who became interested in the project was John Randolph of Roanoke. At this time Dr. Finley was not aware that Jefferson had suggested a similar plan in a letter written in 1811, nor that only the previous autumn a motion had been made in the Virginia Assembly to colonize free blacks on the Pacific coast. In January he returned to New Jersey, where he organized an auxiliary so-

ciety, and then went South again and became president of the University of Georgia, where he died.

FINLEY, SAMUEL (1715-86). An American clergyman of the Presbyterian church, born in County Armagh, Ireland. He came to Philadelphia in 1734, was licensed to preach in 1740, was ordained by the New Brunswick Presbytery in 1742, and in 1743 was settled at Milford, Conn. Having preached at New Haven to the "Second Society" of that place, an organization unrecognized by the church, he was seized as having violated the law forbidding itinerants to preach in any parish without the consent of the settled pastor, and was ejected from the Colony as a vagrant. From 1744 to 1761 he was pastor at Nottingham, Md., where he also conducted an academy of considerable reputation. In 1761 he became president of Princeton. His publications consisted entirely of sermons, among them *Christ Triumphant and Satan Raging* (1741); *Satan Stripped of his Angelic Robe* (1743); *A Charitable Plea for the Speechless* (1747); *On the Death of President Davies* (1761).

FINN, FRANK (1868-). An English ornithologist, born in Maidstone. He was educated at Oxford, where he was classical scholar at Brasenose College. He went on a collecting expedition to East Africa in 1892, was assistant superintendent (1894) and deputy superintendent (1895-1903) of the Calcutta Indian Museum, and in 1909-10 edited the *Avicultural Magazine*. Some of his books are: *Fancy Waterfowl* (1900); *Fancy Pheasants* (1901); *Garden and Aviary Birds of India* (1906); *Indian Waders* (1907); *The World's Birds* (1908); *The Making of Species* (1909), with Dewar; *Eggs and Nests of British Birds* (1910); *Talks About Birds* (1911); *Game-Birds of India and Asia* (1911); *Wild Animals of Yesterday and Today* (1913).

FINNER. See **FINBACK.**

FINNEY, CHARLES GRANDISON (1792-1875). An American clergyman and educator, born at Warren, Conn. He began the study of law in 1818, in 1821 abandoned the law for theology, was licensed to preach by the Presbyterian church in 1824, and was active as an itinerant evangelist from that time until 1835 and at subsequent intervals. In 1834 he became pastor of the Congregational Church known as the Broadway Tabernacle, New York City. He was called to the chair of theology in Oberlin College in 1835, was appointed pastor of the Congregational Church at Oberlin in 1837, and from 1851 to 1866 was president of the college. In 1849 and 1858 he visited England as a revivalist. He established the *Oberlin Evangelist* in 1839 and was its editor until 1863. Among his publications are: *Lectures on Revivals* (1835; 14th ed., enlarged, 1868); *Sermons on Important Subjects* (1839); *Lectures on Systematic Theology* (2 vols., 1847; new ed., 1878). Consult his *Memoirs* (New York, 1876; 2d ed., 1903).

FINNISH LANGUAGE AND LITERATURE. The Finnish language belongs to the Finno-Ugric branch of the Uralo-Altaic family of languages. The tongues of the Finno-Ugric group are spoken in Finland, Lapland, and part of the Baltic provinces by a number of Finnic tribes scattered over a vast area in northern and eastern Russia and western Siberia and by the Magyars of Hungary. The richest and most highly cultivated languages

of the group are the Suomi, the language of Finland, and the Magyar (Hungarian). The dialects are all distinctly agglutinative forms of speech, with decided tendencies towards inflection, so much so that in many grammatical endings the essential difference between agglutination and inflection becomes obscured. As in other Uralo-Altaic tongues, progressive vowel harmony forms a characteristic feature of the Finnish group. The Finnish language is spoken by over 2,500,000 people and in several different dialects, of which the most important are the East Finnish, or Karelian, the South Finnish, and the West Finnish. The first of these is the oldest and least developed; the second is the main vehicle of Finnish literature. It is emphatically vocalic. It has five fundamental vowels—*a*, *e*, *i*, *o*, and *u*—and employs two diphthongs. The grammatical relations between the several parts of speech are expressed exclusively by suffixes. Nouns are used without any article, have no gender, and are declined, in both singular and plural, through 15 different cases, so as to express the relations which in the Indo-Germanic languages are commonly indicated by prepositions. Verbs have but two tenses, present and past, the future tense being expressed by a circumlocution; but their conjugation is very intricate. The language is capable of expressing the nicest shades of meaning. Consult Eliot, *Finnish Grammar* (Oxford, 1890); (Jansuu, *Suomen lounaismurtoiden äännehistoria*; *vokaalioppi*, *descendentti csitys* (Helsingfors, 1901); Karsten, "Några germanska ånord i finskan" (*Nordiska Studier*, 1904); Zabrowski-Moindron, "Relations primitives des Germains et des Finnois" (*Soc. d'Anthrop. de Paris*, 1907); Karsten, "Altdeutsche Kulturströmungen im Spiegel des finnischen Lehnworts" (*Indogermanische Forschungen*, 1910); Szinnyei, *Finnisch-ugrische Sprachwissenschaft* (Leipzig, 1910); Poirot, *Beiträge zur Kenntniss der Quantität der finnisch-ugrischen Sprachen* (Helsingfors, 1912). Ervæst, *Finnisch-deutsches Wörterbuch* (1888) is still the standard work.

The chief monument of Finnish literature is the *Kalevala*, a sort of epic poem, which until the last century existed only in the memory of the peasantry. A collection of some of the scattered parts of this poem was published in 1822 by Zacharias Topelius; but Elias Lönnrot, 13 years later, published a far more complete collection, at the same time giving to it the name by which it is now known. Lönnrot wandered from place to place among the peasantry, taking down from their lips all that they knew of their popular songs. After unwearied researches he was successful in collecting 12,078 lines, which he arranged into 32 runes, or cantos, and published exactly as he heard them sung or chanted. Continuing his researches, he published in 1849 a new edition of 22,793 verses, in 50 runes. The importance of this long-hidden epic was at once recognized in Europe, and translations of it were made in several languages. Some specimens of it were translated into English by Professor Porter of Yale, and published in New York in 1868. The entire poem was translated by J. M. Crawford (1888). It has been several times translated into Swedish, the first time by Castrén, and there are versions in German by Anton Schiefner (1852), in French by L. de Duc (2 vols., 1867), in Hungarian by Ferdinand Barna

(1871). The poem is written in eight-syllabled trochaic verse, and an idea of its style may be obtained from Longfellow's *Hiawatha*, which approaches a true imitation of the Finnish epic. The *Kalevala* is concerned entirely with the mythology or folklore of the people. In the story there is a certain unity of plot, though the various parts are not perfectly homogeneous and appear to be the product of different minds at different periods, the various songs having evidently received additions in course of time. They probably originated before the Finns were converted to Christianity, and when they were not scattered as they are now. When Lönnrot collected the *Kalevala* songs, he also gathered a considerable quantity of lyric poetry, which he published under the name of *Kanteletur*, from the name of the national instrument to which they are sung—a species of harp with five strings. Of recent Finnish poets the most popular seems to be Paavo Korhonen, a peasant, a very sarcastic writer. Other modern poets are Marteska, Ketunen, Ilhainen, Oksaselta, the brothers Leino. Finnish poets that have used Swedish are treated under SWEDISH LANGUAGE AND LITERATURE. The Finns delight in proverbs, Lönnrot having published a collection of upward of 7000, with about 200 charades, while considerable collections of legends and tales have been published. The first printed book in Finnish was probably the *Abecedarium* of Michael Agricola, Bishop of Åbo, which appeared about 1542. A translation of the New Testament by the same Bishop appeared in 1548 at Stockholm. The whole Bible was not translated into Finnish till 1642. During the last two centuries there has been considerable literary activity in Finland, and books in almost every branch of research are found in the language, mainly translations or adaptations. Finland is rich in periodicals of all kinds, the publications of the Finnish societies of literature and of the sciences and other learned bodies being specially valuable. Works on Finnish history and geography are quite numerous. The publication of the *Kalevala* gave a powerful impetus to the study of the Finnish language and the development of a national literature whose growth was fostered by the Society for Finnish Literature. The prominent names are Yrjö-Koskinen in history, Alexis Stenwall (known as "Kivi"), Erkkö (also a lyric poet) and Canth in the drama, and in fiction Juhani Aho, Ingman, Pakkala, and Leino. Among these Aho holds the first place as stylist in a medium which he has been largely instrumental in shaping to literary use. Consult: Comparetti, *Traditional Poetry of the Finns*, trans. by Anderton with an introduction by Andrew Lang (London, 1898); Vasenius, *Öfversigt af Finlands Litteratur-historia för skolor* (Helsingfors, 1893); Billson, *Popular Poetry of the Finns* (London, 1900); Setälä, *Die finnische Litteratur in Die osteuropäischen Sprachen* (Leipzig, 1908), which contains a good bibliography.

FINNISH MUSIC. As in the case of all nations that have developed a distinctive national art, the music of the Finns also rests upon their primitive folk music. These old strains form a connecting link between the Scandinavian and Russian folk music. Both the Runic songs (*ranolaulua*) and the horn melodies (*torventuistusta*) of the Finns exhibit that strange, fascinating monotony produced by the constant

repetition of some short motive. A distinctive feature is the prevalence of the $\frac{3}{4}$ rhythm. The prevailing mood is one of melancholy with frequent touches of the fantastic and demonic. The national instrument was the *kantela*, which, in a modified form, is still in use among the common people. It was a horizontal harp having originally five strings. Gradually this number was increased until at the present day the instrument has 13 strings, tuned in the scale of G minor. A national Finnish art music begins with Frederick Pacius (1809–91), who studied under Spohr and Hauptmann. In 1834 he became musical director at the University of Helsingfors, where he established a choral and symphony society and introduced the works of the German classicists and early romanticists. In his own compositions he betrays the influence of Spohr and Mendelssohn, but obtains national color through the introduction of Finnish folk strains. Ehrström, Greve, Moring, Collan, Linsén, Borenus, Wasenius, and others followed his example. In the works of Martin Wegelius (1846–1906) the influence of Wagner became noticeable and led to the establishment of a Finnish romantic school, whose chief exponent is Robert Kajanus (1856–) (q.v.), a composer of decided talent, who at the same time developed the orchestral society founded by Pacius into the Helsingfors Philharmonic Society, an excellent body of instrumentalists capable of performing the most difficult works. In Jean Sibelius (1865–) (q.v.) has arisen a real master of pronounced individuality, whose cantatas, symphonies, and chamber music have attracted wide attention in Europe and America. The untimely death of the remarkable Ernest Mielck (1877–99) was a serious loss to Finnish music. While at present Sibelius is the towering figure, occupying a place in Finnish music similar to that of Tchaikowsky in Russian music, other composers of distinction are Armas Järnefelt, Oscar Merikanto, Erik Melartin, and Ilmari Krohn. Consult K. Flodin, *Die Entwicklung der Musik in Finland* (Berlin, 1903), and W. Niemann, *Die Musik Skandinaviens* (Leipzig, 1906).

FINNISH VERSION. See *BIBLE*.

FINNS. A people of northern and eastern Europe and western Siberia. Ethnologically they have been classed with Lapps, but Ripley calls attention to the fact that among the Esths on the Baltic coast, through the Tcheremisses on the Volga, and beyond the Ural Mountains among the Ostiaks and Voguls in Siberia, exists a long-headedness not a whit less pronounced than throughout Teutonic Germany. The Finns described by Retzius and others are said to be tall men, with fair skin, flaxen hair, and blue eyes. Height (Tavastians), 1.682 meters; soldiers, 1.713 meters. The cranial index among the Lïvs, Esths, Tcheremisses, Tchuvashes, and Vogul-Ostiaks, is as low as 79 or 80. There are, however, peoples speaking Finnish dialects who are short and brachycephalic. Indeed, they are mixed in blood and necessarily present inharmonious characteristics.

Finnish-speaking people having in their veins more or less Finnish blood may be divided as follows:

TOHODIC BRANCH

1. **FINNIC OR SUOMIC.** The Finnish language proper, or Suomi, is spoken in Finland and the border regions of Russia proper.

2. ESTHS. Esthonia, Livonia, etc., in Russia.
3. TCHUDS. Olonetz and Novgorod, Russia.
4. LAPPS. Lapland, in Norway and Russia.
5. VOTS. St. Petersburg Government in Russia; uncertain.
6. LIVS and KREVINGS. In Livonia and Courland, Russia; not certain.

PERMIAN BRANCH

1. VOTIAKS. Between the Kama and Viatka rivers in Russia.
2. SIRIANS. Mostly on the Vytehgda River, East Russia.
3. PERMIANKS. Perm, Russia. Bissennian dialect, with Votiaks.

VOLGAIC BRANCH

1. TCHUVASHES. Kazan, Saratov, Simbirsk, and Orenburg, Russia.
2. MORDVINS. Chiefly between the Oka and Volga rivers, East Russia.
3. TCHEREMISSES. Viatka, Kazan, Kostroma, and Nizhni Novgorod, Russia.

UGRIC BRANCH

1. MAGYAR OR HUNGARIAN. Hungary; with the Székler dialect in Transylvania.
2. SAMOYEDS. Twenty thousand in all. A few in North Russia, but chiefly in Siberia.

Consult Ripley, *The Races of Europe* (New York, 1899), with excellent bibliography from Castrén (1857) to Niederle (1896). See FINNISH LANGUAGE AND LITERATURE.

FINSBURY. A northern district and central parliamentary borough of Greater London, England. It consists of Holborn, central and east divisions, with a population in 1911 of 87,923. In Jonson's day, as Finsbury Field, it was a resort for the commoner classes of the capital, and as such is mentioned by Shakespeare in *Henry VI* (First Part). It was also a resort of Samuel Pepys and is the burial place of John Bunyan, George Fox, Daniel Defoe, and Susanna, the mother of John and Charles Wesley. John Wesley's house here is preserved as a museum.

FINSCH, OTTO (1839-). A German zoologist and ethnologist, born at Warnbrunn, Silesia. He was in commercial business for a time, but early developed an interest in natural history and in 1860 became an assistant in the Leyden Museum. In 1864-78 he was in charge of the Natural History and Ethnological Museum in Bremen. He undertook expeditions to North America (1872), Lapland (1873), western Siberia (1876), the South Seas (1879-82), and New Guinea (1884-85). In 1898 he returned to the Leyden Museum, but in 1904 took charge of the department of ethnography in the Brunswick Museum. Among his works are: *Neu-Guinea und seine Bewohner* (1865); *Die Pagageien* (1868-69); *Die Vögel Ostafrikas* (1870); *Reise nach Westsibirien* (1879); *Samoa-fahrten* (1888); *Ethnologische Erfahrungen* (1893); *Systematische Übersicht der Ergebnisse seinen Reisen* (1899); *Der Dufong* (1901).

FINSEN, fin'sen, NIELS RYBERG (1860-1904). A Danish physician. He was born in Thorshavn and graduated from the medical school at Copenhagen in 1890. In 1893 he invented the method of treating diseases with decolorized light rays. More than 2000 patients were treated for cancers, etc., at his Institute for

Phototherapy. He was awarded the Nobel prize for medicine in 1903. His works include: *Das Licht als Incitament* (1895); *Ueber die anwendung von konzentrierten chemischen Lichtstrahlen in der Medizin* (1896); *La Photothérapie* (1899).

FIN'SEN LIGHT. See PHOTOTHERAPY.

FINSTERAARHORN, fin'stēr-ār'hörn. The highest peak of the Bernese Alps, having an altitude of 14,026 feet (Map: Switzerland, C 2). See ALPS.

FINSTERWALDE, fin'stēr-väl'de. A small town of Prussia, situated on the Shacketbach, an affluent of the Black Elster, 40 miles north of Dresden (Map: Prussia, E. 3). It has a sixteenth-century Gothic church, an old castle, and manufactures cloth, machinery, heavy iron castings, cigars, screws, de luxe furniture, rubber goods, soap, glass, bricks, and toys. Pop., 1900, 10,726; 1910, 13,111.

FIOCCHI. See FENESTELLA (the Roman historian).

FIGGO. See KOBE.

FIONN, FINN, or FIND. See FENIAN SOCIETY; FIONN MACCUMHAIL.

FIONN MACCUMHAIL, fin mää-cööl' (i.e., 'Fionn, son of Cumhail'). An Irish epic hero, leader of the Fianna, or band of professional soldiers who lived exclusively for war and hunting, about the third century of the Christian era. Although, as always in ancient sagas, we find much of myth interwoven with the story of his life and exploits, there seems no reason to doubt the basic truth of the tradition. His grandfather was said to have been a druid, and his father, Cumhail, was a great leader of the Leinster warriors. Fionn's chief opponent was Aedh, or Iollann, afterward called Gol mac Morna, who was the head of the Connacht Fianna. Goll had slain Fionn's father in the battle of Cnucha, and though he afterward served under Fionn they had no affection for each other. Fionn is said to have been killed at Ath Brea on the Boinn by the darts of Aichlech, son of Duilh-renn. This event is usually placed in the years 252 or 283 A.D. It was Fionn's son Oisín (called Ossian in Scotland) who in later times became famous as the great poet of the Celtic people. Among the Scotch Gael, Fionn's name sometimes takes the form of Fionngall, i.e., Fionn the Stranger, indicative of an outside origin. Fionn's chief abode was at Almhain in Kildare, and his wooing of Grainne, daughter of his enemy Cormac, supreme King of Ireland, and her elopement with Diarmuid forms the subject of one of the longest sagas of this cycle. But Fionn finally overcame his rival and married Grainne in his old age. The magnificence of Fionn's abode as well as his hospitality and the bravery of his followers is described at length in the sagas. Lists are given of his famous warriors, and even of his hounds, among which Bran was the most wonderful. Though renowned as a poet—according to O'Curry, no less than seven poems in the ancient manuscript are attributed to him—his chief glory seems to rest in the fact that he was leader of the Fianna at the time when they were in their greatest strength. Before a soldier could be admitted into his select body he was obliged to promise never to receive a portion with a wife, but to choose her for her good manners and virtues; never to offer violence to any woman; never to refuse assistance to the weak and the poor;

never to flee even before nine champions; and never to exact *eric*, or revenge for the death of any member of his family or clan, which, of course, meant a complete severance of all tribal relations. Other conditions imposed upon the aspirants were equally exacting. He was first required to have passed through the whole scholastic training expected of a man of learning and to be versed in 12 books of poetry. His fleetness of foot must be so great that he could escape from a body of men following in his wake without breaking a bough or disturbing a plait of his hair; he must be able to extract a thorn from his foot while running at full speed; he must defend himself from a hole in the ground reaching to his waist with only a shield and hazel stick for weapons against nine warriors armed with spears. In spite of its good qualities the exactions made by this order upon the clansmen finally became so great that they brought about its downfall about the time of Fionn's death. The Fenian sagas are therefore naturally concerned with the deeds of Fionn and his warriors, relating principally to war and the chase; but their deep feeling for nature, their delight in fairies and phantoms, their love for the humorous and grotesque, as well as their democratic tone, distinguished them from the tales of the aristocratic Ulster cycle which had prevailed in Ireland for generations previous. Tales of the Fenians are still related in Scotland and Ireland, possibly out of respect for the legend that if these warriors were not mentioned for 24 hours they would rise again. A later bardic tradition attempted to attach the Fenian sagas to the introduction of Christianity into Ireland and related that Oisín returned to be baptized after a sojourn of 200 years on an enchanted island of perpetual youth. From metrical fragments of the Gaelic tradition, collected in the Highlands, Macpherson elaborated his celebrated *Poems of Ossian*. Consult: Maclean, *The Literature of the Celts* (London, 1906); Hyde, *Literary History of Ireland* (ib., 1906); Hull, *Teut Book of Irish Literature* (2 vols., ib., 1908-10).

FIO'RA. A village in Switzerland. See FLÜELLEN.

FIORD, or **FJORD**, fyórd (Norw., Dan., bay, inlet). An inlet of the sea, or a narrow bay, indenting a mountainous coast and penetrating deeply into the interior. Fiords are bordered by steep, rocky walls, which descend without interruption to considerable depths below water level. Their origin is usually explained by subsidence of the coast, whereby the sea floods the valleys and washes directly against the mountain flanks. Glacial erosion may have been a factor in determining the prominent relief of the land previous to submergence. The most notable fiords are on the coast of Norway, the longest being the Sogne Fiord, which extends inland for a distance of 112 miles, is 4000 feet deep in places, and is shut in throughout its entire length by high and precipitous rock walls. Hardly less prominent are the fiords of Christiania and Trondhjem. The coasts of British Columbia and southern Alaska, of Iceland, Greenland, Patagonia, and of parts of New Zealand are marked by similar inlets. They are also found on the coasts of Maine and Nova Scotia. Many of the lochs and firths indenting the shores of the British Isles possess the characteristics of fiords. See **SHORE**.

FIORE, fyó'rá, PASQUALE (1837-). An

Italian jurist, born at Terlizzi, Bari. He was appointed professor of constitutional and international law at the universities of Urbino (1863), Pisa (1865), Turin (1876), and Naples (1881), and wrote the following works, some of which have been translated into French and Spanish: *Elementi di diritto costituzionale* (1862); *Diritto internazionale privato* (1869); *Trattato di diritto internazionale pubblico* (1879); *Trattato di diritto internazionale penale*; *Diritto internazionale privato* (1901); *Le droit international codifié et sa sanction juridique* (Fr. trans., 1911, of work published in 1907).

FIORÉ D'URBINO, fyó'rá dūr-bé'nò, IL. See BAROCCI, FEDERICO.

FIORELLI, fyó-rè'l'le, GIUSEPPE (1823-96). An Italian archaeologist, born in Naples. In 1845 he was made inspector of the ruins of Pompeii, but was displaced because of his political opinions. Upon the establishment of the Kingdom of Italy he became superintendent of antiquities in the southern provinces and also professor of archaeology in the University of Naples (1860). In 1860-75 he prosecuted, more systematically than had ever been done before, the excavation of Pompeii. (Consult Mau-Kelsey, *Pompeii: Its Life and Art*, 2d ed., New York, 1902.) In 1875 he was made director of all the excavations in the country, with headquarters at Rome. His publications include: *Osservazioni sopra talune monete rare di città greche* (1843); *Monete inedite dell'Italia antica* (1845); *Notizia dei vasi dipinti rinvenuti a Cuma dal conte di Siracusa* (1853); *Pompeianarum Antiquitatum Historia* (1853); *Descrizione di Pompei* (1875).

FIORÉNTINO, fyó'rén-tè'nò, FRANCESCO (1834-84). An Italian philosopher, born at Sambiase, Calabria, and educated at the University of Naples. After teaching philosophy at Spoleto he was appointed professor of that subject successively at the universities of Bologna, Naples, Pisa, and again at Naples. He was long a member of the Italian Parliament, was the editor of an edition of (Gordano Bruno's *Opera Latina* (vols. i and ii, 1879-84), and published a large number of independent works, of which *Elementi di filosofia* and *Manuale di storia della filosofia* (Naples, 1879-81) deserve especial mention. He was Hegelian in his philosophical sympathies.

FIORINZO DI LORENZO, fyó-rén'tsò dè ló-rén'tsò (c.1440-1521). An Umbrian painter of the early Renaissance. He was born at Perugia, where most of his life was spent. The details of his life are uncertain, and critics differ concerning them. According to Berenson, he probably studied first under Benozzo Gozzoli and Niccolò da Foligno, then under Pollajuolo at Florence, and also owed much to Luca Signorelli. While under the influence of the Florentine masters he painted the eight fascinating panels of the "Miracles of San Bernardino" in the Perugia pinacotheca, which combine the charm and grace of the Umbrian school with the feeling for line and movement of the Florentine. A "Nativity" in the Perugia Gallery and an "Annunciation" in the Portuncula of Santa Maria degli Angeli, Assisi, also belong to this early period, and are marked by a sense of space and atmosphere and expressive characterization. Later his art greatly degenerated, the "Adoration of the Magi" in the Perugia Gallery being the only other work of real value which he

FIRS

produced. Among the paintings ascribed to him are a "Madonna" (1481; Berlin Gallery), "Adoration of the Magi" (Pitti Gallery, Florence), and "St. Jerome" (Jarves collection, New Haven). His most famous pupils were Pinturicchio and Perugino. Consult Berenson, *Central Italian Painters of the Renaissance* (New York, 1908), and Graham, *The Problem of Fiorenzo di Lorenzo* (Perugia, 1903).

FI'ORIN. See REDTOP GRASS; BENT GRASS.

FIORINI, fyô-rê-né, MATTEO (1827-1901). An Italian geographer, particularly distinguished as a historian of cartography. He was born at Felizzano (Alessandria) and became an hydraulic engineer in 1848. He lectured at the University of Turin from 1848 until 1860, when he was appointed professor of geodesy at the University of Bologna, with which institution he remained associated during the last 30 years of his life. In addition to numerous essays, he published the following works: *Le proiezioni delle carte geografiche* (1881), still regarded as a standard work; *Le sfere cosmografiche e specialmente le sfere terrestri* (1894; Ger. trans. by S. Günther, 1895): *Sfere terrestri e celesti di autore italiano* (1899).

FIR (AS. *furh*, Icel. *fura*, OHG. *forha*, Ger. *Föhre*; ultimately connected with Lat. *quercus*, oak). The popular name applied to many coniferous trees of the genus *Abies*. This name has often been employed to embrace all the evergreen coniferous trees that have short, rigid leaves, occurring singly, scattered over the stems, as distinguished from the pines (*Pinus*), whose leaves are longer and usually occur in bundles of two to five or more, and from those conifers having small imbricate scalelike leaves, as arbor vitae and various cedars. The name "fir" should be retained exclusively for species of the genus *Abies*, and the related trees should be called hemlock (*Tsuga*), spruce (*Picea*), etc. The species of *Abies* are mostly trees of pyramidal habit, with erect cones, maturing in one season. Their short leaves, arranged upon the horizontal branches in such a way as to appear to be two-ranked, are flattened, the midrib showing prominently upon the underside. There are about 25 species found throughout the cooler portions of the north temperate zone. One of the most common is the silver fir of Europe (*Abies pectinata*). It is a common tree in central Europe, attaining a height of 150 to 200 feet, with a basal diameter of six to eight feet. In some places it occurs over extensive tracts to the almost entire exclusion of other species. The wood, which is white, soft, of light weight, and contains little resin, is employed in many ways. The tree yields the Strassburg turpentine, which is a superior clear variety. Quite similar is the North American balsam fir (*Abies balsamea*). This species is found from Virginia northward. It attains a height of 50 to 80 feet; the wood is light and not durable. From it Canada balsam is obtained. Closely related to it is Fraser's fir (*Abies fraseri*), which is found farther south. This is a smaller tree, with smaller cones and differently shaped bracts. Upon the Pacific coast are a number of indigenous species of fir, the timber of which is very valuable. *Abies grandis*, which is found from British Columbia to Lower California, one of the finest trees of that region, is known as the great silver fir and attains a height of 300 feet and a diameter of 10 feet or more. The wood is white and soft

and is extensively consumed for cooperage, boxes, etc. Closely related to it is the *Abies nobilis* of the same range, with much the same characteristics. Both species are highly valued in England as ornamentals, but they have not been extensively planted in the eastern United States. *Abies nordmanniana* of the Caucasus is one of the most hardy of all the species of fir. It is a tree that becomes 150 feet high, with a trunk diameter of 4 or 5 feet. It has been introduced for forest and windbreak planting in parts of the United States and has already proved one of the most valuable evergreens for such uses. The Mount Enos fir (*Abies cephalonica*) and the Spanish fir (*Abies pinsapo*) occur in the south of Europe, where they are trees 50 to 80 feet tall. Their timber is considered valuable. *Abies webbiana* occurs in the Himalaya Mountains at elevations from 7000 to 13,000 feet. It is a fine tree, growing to a height of 130 feet or more and a diameter of 8 to 10 feet. The wood is harder and heavier than that of most species of fir, contains more resin, and as timber is very valuable. In Mexico is found *Abies religiosa*, a magnificent silvery-leaved tree, which grows to a height of 150 feet and a diameter of 6 feet. It is well adapted to lath and shingle making. The boughs are extensively used as a church decoration. A number of other species attain the size of large trees, as *Abies venusta* of the Pacific coast, *Abies sibirica* of Siberia and Russia, *Abies cilicica* of Asia Minor, *Abies veitchii*, and *Abies homolepis* of Japan. Of many of the above enumerated species of *Abies* there are cultural varieties that differ in habit of branching, color of foliage, drooping habit, etc., some of them being very handsome ornamental trees. For accounts of the somewhat similar and formerly combined species of evergreen conifers, see SPRUCE; HEMLOCK.

FIRANDO. See HIRADO.

FIRANGI, fê-rîng-ê. An Eastern name for Europeans, whose land is called Firangistan. The name is supposed by some to be a corruption of Frank and to date from the Crusades, while by others it is derived from the Varangians (Warings), Norsemen who entered into the service of the Byzantine emperors at Constantinople. In Bengal the mixed descendants of the Portuguese, though differing in no respect but religion from the natives, are especially distinguished by the term *Niranghis*.

FIRBOLGS. The name given in the fabulous history of Ireland to a tribe said to have descended from the Nemedians, who, under their leader Nemed, came to the island some 23 centuries before the Christian era. After remaining for about two centuries the greater part fled because of the oppression of Scandinavian pirates known as the Fomarians. The Nemedians formed three bands—one going to Scotland, another to a northern part of Europe, becoming the tuath (or tribe) De danann of a later period, and the third to Greece. The colony in Greece, or the Firbolgs, became restive under oppression and decided to return to Ireland, and under the rule of the five sons of Dela they enjoyed full possession of Ireland for something less than a century. Their kinsmen, the tuath De danann, also returned, and the Firbolgs were forced to consent to the partition of the land. Such was the condition of Ireland until the Milesians came. These had left Egypt for Spain, and, after subjugating the latter

country had determined to conquer Ireland. They became masters of the island about 1700 B.C. According to Guest, *Origines Celticae* (2 vols., London, 1883), Firbolgs is simply the Irish name for the Belgæ. See IRELAND.

FIRCKS, fërks, THEODOR VON, BARON (1812-72). A Russian-German author, born at Kalven, Courland, and known under the pseudonym Schédo-Ferroti. He became an officer in the engineering corps of the Russian army and supervised the building of Russia's southern railroad lines. His sojourn in this region led him to write his *Lettres sur les chemins de fer en Russie* (1858). Subsequently becoming Russian diplomatic agent at Brussels, he was dismissed in consequence of his publication of a brochure in favor of the Polish cause entitled *Lettre d'un patriote polonais au gouvernement national de la Pologne* (1863). His most important work, *Études sur l'avenir de la Russie* (1858-68), his *Lettres sur l'instruction populaire en Russie* (1869), and *Die internationale Arbeiterbewegung* (1872) made him in his time a very influential writer in the domain of Russian politics.

FIRDAUSI, fër'dou-sè', or **FIRDUSI**, fër'dou-sè', ABU'L QASIM MANSUR, or AHMAD, or HASAN (c.935-1020 or 1025). The greatest epic poet of Persia and one of the foremost in all literature. He was born in Tûs in Khorassan about 323 A.H. (935 A.D.). The name of his father is quite unknown, but he seems to have been a man who lived in very comfortable circumstances and one of the Dihqân, or landed gentry. The best account of the poet's life is given by 'Arudî, of Samarkand, who visited Tûs about a century after the death of Firdausi. This record is preserved by Ibn Isfandiyyâr in his chronicles of Tabaristan (the passage is published by Ethé in vol. xl of the *Journal of the German Oriental Society*). At the age of 28 Firdausi married, and of the two children born to him, one, a daughter, survived her father. When the poet was about 36, he began the work by which he is best known, the *Shâh-Nâmâh*, or Book of Kings, which occupied him for 35 years, and of which he completed the first edition in 1010, when he was about 80 years of age. Other Persian poets had tried their hand at the theme before him, for the remembrance of their own Iranian history was preserved despite the conquest of Islam. Of these predecessors the most noteworthy was Daqqî, who flourished in the tenth century A.D. His work, placed in Firdausi's hand by his compatriot, Mohammed Laskbari, formed the nucleus of the *Shâh-Nâmâh*.

This great Book of Kings traces the history of Persia from the mythical ruler Gayumart, who lived, according to Iranian tradition, about 3600 B.C., to the Mohammedan conquest in 641 A.D.

The poem, which according to Firdausi's own account contains 60,000 couplets, or more than seven times the amount of the *Iliad*, treats first of the legendary kings of Iran, Gayumart, Hoshang, Tahmuras, and Jamshid, who was the most famous of them all, and reigned 500 years during the golden age of the earth. Following this happy period came the evil rule of the Arab Dahhâk, or Zohak, who was tempted by Ahriman, his own ancestor, and fell into sin, increasing his evil until the smith Kavaeh set up his leathern apron, as the banner of revolt, and Fredun (Faridûn), the Thrætaona of the

Avesta, came and bound the tyrant and confined him beneath Mount Demavend on the shores of the Caspian. The reign of Fredun was a long one, but its close was darkened by the strife of his three sons, among whom he had divided the kingdom. He was succeeded by Minochihr. At this point in the poem there is inserted an episode of considerable beauty which recounts the loves of Zal, of the royal line of Iran, and Rudabah, the daughter of the King of Kabul, whose union was blessed by the birth of the most romantic of all the heroes of the *Shâh-Nâmâh*, Rustam, who occupies a position in Iranian legend somewhat analogous to that of Hercules in the classic literatures. It was Rustam who during the reign of Kaus won Mazanderan for the Persian King and performed seven romantic and perilous quests before he could succeed. It was he, too, who in combat unwittingly slew his own son Suhrab, who, ignorant of his paternity, was fighting among the foes of Iran. Later Rustam again invaded Turan to revenge the murder of Syavush, a son of Kaus. He fought also with Firud, King of India, and with the powerful Turanian ruler Kamus. From this time on until the dawn of the historical period, the *Shâh-Nâmâh* is occupied mainly with accounts of the wars between the Iranians and their hereditary foes, the Turanians. With the opening of the reign of Gushtasp there is an episode of extreme importance giving an account of Zardusht, or Zoroaster (q.v.). The interest of the epic, which was slightly less during the reigns of Khusrav and Lohrasp, now revives, and it is continued by the legend of the seven adventures of Isfandiyyâr, the son of Gushtasp. The father's jealousy of his son, however, caused Isfandiyyâr to be imprisoned, until his aid against the Turanian Arjasp became indispensable. Then he was released, but as soon as possible was sent by Gushtasp on further adventures and at last was craftily matched in a duel with Rustam, by whom the younger hero was slain, while Rustam himself soon afterward fell in battle. It is noteworthy that there is no mention in the *Shâh-Nâmâh* of the Achemanian kings, a fact which is not as yet altogether satisfactorily explained. Of the Arsacidae Firdausi knows only the names. The history takes a sudden leap to the Sassanidae (q.v.). According to the *Shâh-Nâmâh* Gushtasp was followed by Bahman and his son Dara (Darius), who married a daughter of the Emperor of Rum (Byzantium). This princess, who was soon divorced by Dara, gave birth at Byzantium to Iskandar, or Alexander the Great (q.v.). The remainder of the epic, excepting for the long account of the reign of Bahram Gor, is of less interest. It traces with a fairly close adherence to history the reigns of the Sassanian kings down to the defeat and death of Yezdegerd III (641 A.D.). Yet there are interwoven in this latter part of the epic, and elsewhere, numerous episodes of much interest. Among these may be noted the story of the seven banquets of Nushirvan with the sages, of whom he inquires concerning a mysterious dream, the introduction of chess from India into Persia during the reign of the same monarch, and the story of the loves of King Khosru Parviz and Queen Shirin.

Thus we have a valuable source for the early history of Iran, which is needed to supplement the accounts given in the Old Persian cuneiform inscriptions and the Avesta (q.v.). It would

seem that Firdausi had a distinctly patriotic motive in writing the *Shāh-Nāmāh* in addition to his poetic and historical incentives. He plainly desired to keep alive in the hearts of the Persians the glories of their ancestors' deeds and faith in order that they might not become mere puppets under Arab domination. This is shown not alone by the theme and spirit of the epic, but even by the diction employed. While it is considered a mark of elegance in other Persian poetry to employ as large an element of Arabic as possible, Firdausi rigorously adheres throughout to the native Persian vocabulary, and the percentage of Arabic words in his work is extremely low. The poem flows on in a dignified style, without the excess of coloring or the straining after effect which is often found in Oriental poetry.

The epic as a whole is dedicated to Mahmud of Ghazni (see GHAZNIVIDES), to whose court Firdausi went to present his work as the tribute of a poet of fame. Meagre was his reward from the parvenu Turk; at most the sum was not more than 20,000 dihrans (about \$2400). The disappointed poet found revenge in a bitter satire on Mahmud, which he substituted for his former eulogies of the Sultan. Firdausi then fled to Herat, and thence to Tabaristan, where the Prince, Ispahbadh Shahryar, protected him and counseled him to withdraw the offensive verses against Mahmud. This advice was followed, and it would seem, from the poet's later history, that the lampoon never reached the Sultan. Firdausi is next found living under the protection of one of the princes of the house of Buwāyih, for whom he composed a romantic epic of 9000 couplets on the loves of Yusuf and Zulaykhā, the Arabic version of the biblical story of Joseph and Potiphar's wife, a favorite theme of Oriental poets. In his old age Firdausi returned to his native town of Tūs. There is a tradition that Mahmud at last forgave the poet for his satire, and sent him a present of 60,000 dihrans (about \$7200). A portion of this may well be true. At all events, we know that he died in peace, probably in 411 A.H. (1020 A.D.) or even later (about 1025 A.D.). About the name of Firdausi, as of many other great authors, a number of poetic legends have gathered. As an example, may be mentioned the story that Mahmud's gift of favor came at the moment when the body of the poet was being carried to its final resting place.

Bibliography. Editions of the *Shāh-Nāmāh* have been published by Macan (4 vols., Calcutta, 1822-29); Mohl (6 vols., Paris, 1831-68); Vullers and Landauer (3 vols., incomplete, Leyden, 1877-84); translations by Mohl (7 vols., Paris, 1876-78); Rückert (incomplete, Berlin, 1890); Pizzi (8 vols., Turin, 1886-88); A. G. Warner and E. Warner (in blank verse, 6 vols., London, 1905-12); Schack, selections (3 vols., Stuttgart, 1877); Modi (trans. into Gujarati, 1904); Rogers (London, 1907); Modi, *Episodes from the Shāh-Nāmāh* (2 vols., Bombay, 1906-07); *Episodes of the Famous Women of the Shāh-Nāmāh* (ib., 1908). There is an abridgment in English by Atkinson (London, 1832; reprinted New York and London, 1886) and by A. Rogers (London, 1907), and a sketch of the *Shāh-Nāmāh* in Reed's *Persian Literature* (Chicago, 1893). A critical edition of the *Yūsuf u Zulaykhā* was published by Ethé (Oxford, 1908), and the poem has been translated by Schlechta-Wssehrd (Vienna, 1889).

For further information consult: Nöldeke, in *Grundriss der iranischen Philologie*, ii (Strassburg, 1896-1904); Horn, *Geschichte der persischen Litteratur* (Leipzig, 1901); Browne, *A Literary History of Persia* (New York, 1902-08), and the authorities referred to there.

FIRE. The discharge of firearms, as the *fire* of the enemy, *broadside fire*, etc. *Bow fire* includes the fire of all pieces of a ship which are so mounted as to be able to fire directly ahead; *stern fire*, that of all pieces which can fire directly astern; *broadside fire*, all which can fire abeam. A *raking fire* is one so delivered that the projectiles pass through a vessel in a fore-and-aft direction, or nearly so. A *plunging fire* is one directed downward from an elevation; if directed at a vessel, such a fire would pierce her decks. *Direct fire* is used when the gun is aimed so that the projectile will hit by direct impact. *Ricochet fire*, much used in the days of spherical projectiles, consisted in firing at a short range and allowing the shell to ricochet, or be reflected from the surface of the water, once or twice before reaching the object aimed at. Elongated projectiles from rifled guns ricochet in a very irregular manner, usually turning sharply to the right and oftentimes rising at a considerable angle after meeting the water; this behavior of rifle shell has caused the discontinuance of ricochet fire. *High angle, mortar, or howitzer fire* is effected by elevating the piece at angles of 30° or more above the horizontal and effecting a hit by dropping upon the object. The same effect is obtained by *curved fire* from ordinary guns, which is brought about by extra elevation and a reduction of the powder charge. Both kinds of fire are used to reach objects over other higher ones which intervene. See GUNNERY; MORTAR; ARTILLERY; BALLISTICS; TARGET PRACTICE.

FIRE, ORDEAL BY. See ORDEAL.

FIRE, PRIMITIVE. The conception of early man as a fireless animal has been entertained from remote times, and the prevalence of this idea in origin myths seems to present a real survival in lore from the primitive period. This great body of lore with attendant customs clearly points out the stages in man's progress by which fire from an unused and almost unknown force became interwoven with his life as a prime necessity. These stages represent: (1) man in the same case with his feral neighbors as to fire, but having a clearer knowledge of its manifestations in the lightning, volcano, and other exhibitions in nature (stages of the knowledge of fire); (2) from some of these sources fire is acquired and preserved for the most primitive use conceivable, perhaps for protection from the beasts (stage of acquisition and preservation of fire); and (3) the stage marked by the invention of a process of creating fire at will, either by friction of wood in the fire drill, fire plow, and fire saw, or by the percussion of minerals in the flint and pyrites (stage of fire producing). Growing out of these great strides in man's progress comes the fourth stage, marked by an increasing utilization of this element down to the present (stage of the conquest of fire).

It will be seen that, in respect to the distribution of mankind over the earth, fire has played the leading part. In the first stage, before the use of fire, the distribution of man fell under the laws regulating the movements of animals. In the second stage, with the pres-

ervation of fire, man became sedentary and aggregated into groups having the germs of the state. In the third stage, with the means of providing fire at will, fire preservation sank into a lower place, and man became free to immigrate into different zones. With the cumulative employment of fire in the mechanical era, there enters a time element, and great masses of humanity move quickly to settle the waste places of the earth where before the movement was slow. From this most fertile of beginnings in the camp fire have grown a great majority of the arts that have supplied man's artificial wants—those primary arts represented by lighting, cooking, offense, and defense; and those secondary arts connected with the mechanics of fire or its use in agriculture, timbering, boat building, metallurgy, ceramics, etc., all with vast ramifications. There is also a social history of fire, a mythology embracing the various phases of fire worship with its ceremonies and observances, and a folklore of magnitude and surpassing interest. Consult: Tylor, *Researches into the Early History of Mankind*, pp. 229 et seq. (New York, 1905); Hough, *Smithsonian Report*, 1888, part ii, pp. 531-587; id., 1890, pp. 395-409.

FIRE, SAINT ANTHONY'S. See ERYSIPELAS.

FIRE ALARM. A fire-alarm system consists of a telegraph signaling equipment with a network of wires running from a main office, or fully equipped central station, to all parts of a city or district, and provided with signal boxes conveniently placed and accessible, from which alarm signals may be sent to the fire department by any one without special knowledge of the instruments, simply by turning a crank or pulling a hook. Each fire-alarm box or street-signaling station contains a transmitter or device to make and break an electric circuit. The earliest box, first used at Boston, Mass., in 1851, contained merely a form of telegraph key controlled by a revolving wheel which gave a certain number of signals when the person sending the alarm turned the crank "six times slowly," as the directions indicated. In its simplest form and essential characteristics a fire-alarm signal box may be described as follows: A metallic wheel is provided with teeth or notches, the spaces between which may be filled with some nonconducting substance; a contact spring or follower rests against the wheel and, as the wheel is turned, touches in succession the projecting teeth, closing and opening the circuit at each tooth and causing a signal at the central office, or, in small towns where there is no central office, at all the engine houses or alarm stations, such as tower-bell mechanisms, connected on the electric circuits of the system. If the arrangement on the wheel should be two teeth, a space, three teeth, a space, and two teeth, followed by a long space, one rotation of the wheel would give two signals, then three, then two, or the number 232, and this number would be repeated as often as the wheel is rotated. The wheel may be turned by a crank or, after being released, automatically by a spring and clockwork; in the latter case, once started it cannot be stopped until the total number of revolutions for which it is set and wound have been made. There is often provided an inner box, to which the firemen alone have keys, which contains telegraph instruments for use in communicating with headquarters, by means of which the officer in charge is enabled

to give information and call for such extra and special supplies as are needed or signal the extinguishing of the fire. The outer doors of fire-alarm boxes at one time could be opened only with keys intrusted to citizens, the nearest resident, the police, etc., but now automatic doors for alarm boxes are more generally used. These may be opened either with a key accessible by breaking or removing a small piece of glass or without a key by simply twisting the door handle. The signal from the box may be received upon a common Morse recording instrument, or on a special form of recorder, and registered on a strip of paper as well as shown by an indicator. Both the time of its receipt at and transmission from the central station may be recorded by pens on a revolving paper roll or appropriate printing register. Through the agency of a sensitive relay and a secondary circuit which may be employed also to ring tower bells and sound steam-whistle alarms, automatic apparatus transmitting the alarm to the appropriate fire companies may be set in operation.

Historical Sketch. Methods of transmitting news of outbreaks of fire are very old, and even until about the middle of the nineteenth century watch towers with alarm bells were maintained in American cities, but the perfection of the electric telegraph was essential to the development of instantaneous and reliable apparatus, which soon became largely automatic. As early as 1845 Dr. W. F. Channing, of Boston, published an article in the *Advertiser* of that city, outlining a fire-alarm telegraph system. In 1850 Charles Robinson used Morse apparatus for signaling fire alarms from police stations and engine houses in New York City to watchmen at tower bells who sounded the signal of the appropriate district. In 1851 the city of Boston appropriated \$10,000 for testing a telegraph-signal plan, and it was put into operation on April 29, 1852. Dr. Channing and Moses G. Farmer developed the system, which was constructed for Boston by Mr. Farmer and operated under his direction for several years. In 1857 these men patented the system as developed. John N. Gamewell became interested in the matter in 1855 and by 1860 had acquired the patent rights. Subsequently he did much to improve and introduce the system; but the Civil War, conservatism, and other obstacles were sufficient to prevent its introduction in more than some 20 cities by 1871. New York installed a fire-alarm telegraph system in 1869, but has never maintained or equipped this department on a scale commensurate with its other fire apparatus.

In 1875 the number of cities using the fire telegraph system was 75, and since then the increase has been rapid, so that to-day most towns of 10,000 population or over, and many smaller ones, have the fire-alarm telegraph. Although various systems are in use, that devised by Channing and Farmer, and developed and improved by Gamewell and his associates and successors, has been the one most generally employed in America. In 1867 the "noninterfering pull" was patented by O. J. Chester, and in 1880 a noninterfering box was patented by James M. Gardiner. In 1889 J. J. Ruddick patented the "successive" feature, whereby signals from two or more boxes on the circuit pulled simultaneously were recorded. The keyless door was patented by Tooker in 1875 and the automatic keyless door by N. H. Suren in 1895.

In this the gong was not sounded until the mechanism of the box was started.

The simple mechanism described in outline above would be found in what is known as a plain, or interfering box, the simplest type of the signaling apparatus. A number of these can be grouped on a single circuit, but it is obvious that if two boxes were put in operation simultaneously the signals would interfere and would not be properly received and recorded at the central station. Accordingly noninterfering boxes were developed where such a condition may be obviated by the selection of one box to transmit a complete and definite signal and by the temporary cutting out of circuit of any other box or boxes whose signals might interfere and come to the receiving mechanism blurred or confused. This noninterfering feature has been combined with what is termed a successive type of fire-alarm box where definite independent signals may be transmitted from a number of boxes operated at or about the same time without the loss of a signal from any of the boxes, one set of signals following another as soon as its determined number of rounds are completed and the circuit is free, so that both are received and recorded. The importance of this is realized when it is considered that the circuit loops often contain as many as 20 or more different boxes, even 50 boxes under very unfavorable conditions, in order to economize the wire circuits, and by a so-called interlacing system the alarm boxes are distributed as widely as possible. This, however, is not good practice, and from 7 to 12 boxes on a circuit are more desirable. In 1913, in New York City, a new type of box was evolved which contained the essential features of the successive and noninterfering box, the basic patents of which had expired, with an apparatus that provided for an automatic return through the ground in case of failure or defect to the circuit that under the older system would have impaired the usefulness of the circuit. Such a box permitted the use of the portion of the circuit that was intact and used the ground for a return, at the same time giving a signal to the operator, who automatically could switch into the circuit a powerful battery which would insure the proper transmission of the alarm. The best systems work on a closed-battery circuit, and it is possible to detect at once any failures or defects, and the signals are indicated at headquarters through an automatic recorder and an indicator on which the number of the box is displayed.

On receiving the signal at the central station or fire headquarters, it may be transmitted to the various engine houses automatically in the case of a small city, or manually, by means of an appropriate transmission apparatus and series of independent circuits. The automatic apparatus is connected by means of a system of relays or repeaters, so that the signals go out practically instantaneously to all the engine houses and are given on the large gongs and the indicators at each station, the various companies due to answer the various alarms proceeding in the usual way. A second signal follows on a yoker or independent circuit. The automatic repeating of every alarm to each company, whether due at the station sounded or not, would be confusing and unnecessary in a large city, so an operator or semiautomatic system is usually employed. In the manual

form of transmission, as soon as the station from which the alarm is received is indicated, the operator takes from a cabinet a disk appropriately notched on its edge and attaches this to the transmission mechanism sending out a signal over the appropriate circuits, which may include every company in the city or only those in a selected district. In some departments the alarm is sent to every company, and the men and apparatus, whether due to respond or not, take their places in readiness to answer the alarm. In other instances, and often at night, the signals are sent only to the companies in a district directly affected. Where there are two independent circuits running from headquarters to the various fire companies it is not infrequent that before the second set of signals has been sounded the company is on its way to the alarm. The equipment at the individual fire houses consists of the bell and gong of the two circuits, an indicator, a recorder, a clock, and various local circuits which release the horses from their stalls, open the doors, and turn on the lights, so that no time is lost. The fire departments of most American cities have, in addition, an elaborate telephone equipment maintained usually in connection with, or by, the local telephone companies, and communication is maintained between the engine house and fire headquarters, so that when the company answers the alarm its absence from its house may be reported immediately, and arrangements made for protecting the district should a second alarm be turned in. These telephone systems, often with auxiliary department switchboards, are maintained as a reserve in case of accident to or failure of the alarm system and under ordinary circumstances to supplement it.

For many years gravity cells were used to supply current to the various circuits, but in all important central stations they have been supplanted by storage batteries which are charged and furnish current at the desired potential. The fire circuits in most cities of any size are now placed underground, and while there is secured increased safety from interruption by weather conditions, such as sleet and ice, there is also the danger of interference due to high-tension circuits for power. For such protection, as well as protection from lightning, elaborate lightning arresters are required, and constant improvements are being made in apparatus of this kind.

An important side of the fire-alarm system is in connection with the protection of large public and other schools. In America fire drills have been developed to a high degree of efficiency, thus preventing panics and loss of life which are apt to occur at an outbreak of fire where a large number of children or other persons, such as factory operatives, are concentrated in limited space. For schools and factories fire-alarm systems have been developed where the sending of an alarm from a certain box causes bells to be sounded, at which ranks are formed and an orderly march is made to previously determined exits. These alarm boxes may communicate with the superintendent's or principal's office in the building and with the local fire department and police stations, and often are arranged so that they may be sounded for purposes of drill without actually bringing out the apparatus.

In connection with city fire-alarm systems various automatic and private alarm systems

are installed in public buildings and on the premises of those requiring or desiring such special protection. These may involve a system of small call boxes located as frequently as desired and connected with the nearest street alarm box, whose mechanism is set in operation by the signal made within the building. Often these small boxes have a glass face which can be broken and the mechanism set in operation by pulling a chain or turning a key. In other cases some form of automatic or thermostatic fire detectors may be employed where an increase in temperature causes the device to operate and the signal to be transmitted to the local headquarters of the fire-alarm service company, as well as ringing a gong on the premises, with possibly a return signal indicating that the alarm has been received. This may result in an immediate examination of the premises from which the signal is indicated, or, in addition, a signal may be sent to fire headquarters, and not only the employees of the alarm service company, but the city fire department will answer as in the case of a regular alarm.

In many cases where a building is protected by automatic sprinklers the operation of these sprinklers and the discharge of water is also sufficient to send in an alarm, either to the fire-alarm company or directly to the fire department. For further information, consult publications of the National Board of Fire Underwriters, catalogues of leading manufacturers, and chapter on "Fire Alarm Telegraph," in *Mayer, American Telegraphy* (New York, 1903).

FIREARM. A device consisting essentially of a straight tube, provided with means of igniting the charge, which projects a mass of metal or other material through the force of the expanding gases developed by the burning of a charge of gunpowder. It is said that some sort of firearm in which stones were used as projectiles was in use by the Chinese in the eighth century, but this and other legends ascribing even an earlier date are of doubtful character. However, there is some proof that at the beginning of the thirteenth century firearms were possessed by the Mongols and that Genghis Khan used them in 1258. The Mohammedan powers, then in the height of their development as regards science and art, seem to have been familiar with the use of firearms in the twelfth century and had developed practicable small arms in the thirteenth. There is some probability that the early form of small cannon used in western Asia and in Europe was derived from the tubes set in the bows of galleys for discharging Greek fire (q.v.) upon the decks of the enemy at the moment of ramming. Greek fire contained the essential ingredients of gunpowder and was very explosive if confined. Early in the fourteenth century cannon came into general use in Europe, and by the end of that century cannon and small arms had become common. See **ARTILLERY**; **BALLISTICS**; **GUNNERY**; **GUNPOWDER**; **ORDNANCE**; **SMALL ARMS**; **GUNS, NAVAL**.

FIREBACK. A pheasant of the Malayan genera *Lophura* and *Acomus*, in which all the species have metallic plumage on the back. See **PHEASANT**.

FIREBALL. A projectile designed, when discharged from gun or mortar, to set fire to an enemy's defensive works or for giving illumination during operations against him. Fireballs were the successors to the fire arrow of

ancient warfare and have in turn been superseded by the rocket and the incendiary shell. See **AEROLITE**.

FIRE-BELLIED FROG. See **FEUERKRÖTE**.

FIREBILL. A paper giving in detail the stations and duties of officers and men of a vessel of war upon the alarm of fire. When the crew of a ship are at their stations as defined in the fire bill, the gathering is known as *fire quarters*. All precautions are taken against fire, and pumps, hose, and extinguishers are prepared for use.

FIREBIRD. See **TANAGER**.

FIRE BLIGHT, or PEAR BLIGHT. One of the most destructive diseases of pears, apples, and other pomaceous fruits. While not as regular in its attack as some other plant diseases, no other is more destructive when it does appear. Fire blight is a contagious bacterial disease due to *Bacillus amylovorus*, which gains entrance through the soft tissues of new growth such as twigs and young fruits, through wounds made by insects or otherwise, but especially through the nectaries and stigmatic surfaces of the blossom, from which point of infection the bacteria rapidly spread, killing the tissues as they progress. The leaves are sometimes attacked, but usually they die as a result of the destruction of the twigs, and they remain dried and attached to the branches, forming one of the most striking features of the disease. The part attacked is the cambial layer of the twigs, down which the disease passes to the branches, and finally to the trunk, forming distinct cankers which are often the source of new infections. Its rate of progress is not very rapid, and, when it has run its course, the line of demarcation between sound and dead wood is easily seen. Upon bearing trees the first place of attack is usually in the blossoms, the germs being spread from flower to flower and from tree to tree by bees and other insects. The disease may be recognized by clusters of blossoms turning black. From these the disease spreads. It seems to winter over in infections that have occurred late in the summer. The infected bark is moist, and in the spring gum exudes from the diseased area. This is especially attractive to bees, which carry the germs from the gum to the flowers. Rapid growth of the trees, which may be caused by severe pruning or by too much nitrogenous food in the soil, favors the spread of the disease. Anything that will check the growth of the trees, such as withholding cultivation and nitrogenous fertilizers, should be adopted. The most satisfactory treatment is to cut out and burn all blighted limbs while the trees are dormant. All parts suspected of infection should be carefully examined and severely pruned back six inches or a foot below the line of separation between sound and diseased wood. The best time to do this is in the autumn, when the contrast between the diseased and the sound branches is most striking. A careful inspection of the trees should be made several times during the summer, and all new infections should be cut out and burned. If all pear, apple, quince, crab, hawthorn, and allied plants be looked after in this way, the serious spread of the disease may to a great degree be prevented.

Fire blight is one of the first demonstrated diseases of plants due to bacteria. Its cause was discovered by Dr. T. J. Burrill, of the University of Illinois, about 1879. It has spread

widely in the United States, and in 1913 it was reported in Europe. In addition to species of pomaceous plants, it is now known to attack plum trees. Different varieties of pears, apples, etc., vary widely in susceptibility to this blight, and those least subject to it should be given preference in planting.

FIRE BOAT. See FIRE ENGINE.

FIRE BOTE. See ESTOVER.

FIRE BRICK. A brick made of clay capable of standing a high degree of heat—not less than 2700° F. Fire bricks are made in various sizes and shapes and are required for the lining of furnaces, and for various receptacles used for the treatment of raw materials by heat, such as the smelting and refining of ores, also in the clay industry for brick and pottery kilns, and for the manufacture of Portland cement, and in coking. Naturally the essential element in the composition and manufacture of fire brick is fire clay, and where considerable deposits of this substance are found, works for making fire brick are often located. Fire clays usually contain small amounts of fluxing materials, and ordinarily are classed as flint clay and plastic clay, the former containing a large percentage of kaolin, and possessing a greater amount of refractoriness, though often flint clay is mixed with the plastic clay which increases the deformability. In making fire brick various crushed silica rocks and other materials may be mixed with fire clay or lime in order to obtain a product suitable for the work in hand. The actual manufacture of fire brick is quite similar to that of common brick. The mixture of plastic fire clay with the other materials is the first stage, and it is finally ground in a dry pan or disintegrator. It is then screened and tempered in a pug mill, after which it is molded and dried, and then repressed and burned. The burning takes place usually in a down draft kiln at a temperature ranging from 2250° F. to 2700° F. Sometimes, however, an up-draft kiln may be used (see KILN). In the United States New Jersey was the first State to produce fire brick, the industry being established there in 1812, and since that time it has spread widely, many States producing fire clay in greater or less amount. The increase has come largely with the growth of metallurgical processes, particularly the vast development of the iron and steel industry (see IRON AND STEEL, *Metallurgy of*). In the actual manufacture of fire brick there is little variation from ordinary brick processes, but the composition of the resulting product has received considerable attention, owing to its effect on the process. The general nature of working will be found discussed under BRICK and CLAY, while the construction of various furnaces for metallurgical work is described under IRON AND STEEL. A valuable technical work of reference is Havard, *Refractories and Furnaces* (New York, 1912). Consult also Kanolt, "Melting Points of Fire Bricks," *Technological Paper, No. 10*, United States Bureau of Standards (Washington, 1912), and Ries and Leighton, *History of the Clay-Working Industries in the United States* (New York, 1909).

FIRE CLAY. A variety of clay capable of withstanding a high degree of heat, but varying otherwise in its physical properties. This is because it contains a low percentage of fluxing impurities such as iron, lime, magnesia, and alkalies. A good fire clay should resist a temperature of 2900° F., and some will resist

3500°; but unfortunately many clays are called fire clays which are not really refractory. Fire clays are often plastic, but in the United States especially there exists a nonplastic variety known as "flint clay." Fire clay is found in many sedimentary formations, and in the Carboniferous rocks may be associated with coal, but all clays under coal are not fire clays. In the United States it is found in the Carboniferous rocks of Pennsylvania, Ohio, Missouri, and Kentucky; in the Cretaceous of New Jersey and other States, especially Colorado; and in the Tertiary of the Gulf States, Tennessee, Kentucky, and California. Large quantities are obtained in Germany, England, France, Belgium, Austria, and Russia. Some of the German and Belgian clay is exported to the United States. Deposits are also known in the Dirt Hills, Saskatchewan, and Sumas Mountain, British Columbia.

The following analyses give the composition of some American and European fire clays:

1. Flint clay, Hunker Station, Pa. 2. Flint clay, Mineral Point, Ohio. 3. Golden, Colo. 4. Woodbridge, N. J. 5. Stourbridge, England.

Fire clays are used in the manufacture of fire bricks, gas retorts, glass pots, assayers' furnaces, crucibles, and other objects which in their use are subjected to a high degree of heat, but their value for one or the other of these purposes depends on various physical properties in addition to refractoriness.

Among the varieties recognized are: *flint clay*, a hard form, resembling flint in appearance and lacking plasticity, found in the same bed with plastic clay; *ganister*, a refractory clay having a high percentage of silica; *pot clay*, a fire clay burning dense at a low red heat, but otherwise refractory, used in the manufacture of glass pots; *fire mortar*, a sandy fire clay used for making mortar to set fire bricks; *retort clay*, a very plastic refractory clay used in the manufacture of gas retorts. The fire clay produced in the United States in 1912 amounted to 1,695,337 short tons, valued at \$2,363,357. Consult Bischof, *Die feuerfesten Thone* (Leipzig, 1895), and Ries, *Clays: Occurrence, Properties, and Uses* (New York, 1908). See CLAY; COAL; AMBOY CLAYS.

FIRE CREST. A British kinglet (*Regulus ignicapillus*), more fully called "fire-crested wren" and also "goldcrest." See KINGLET.

FIRE DAMP. An explosive mixture of marsh gas (carburetted hydrogen, CH₄) and air. The specific gravity of the mixture being lighter than air, the fire damp is looked for in cavities of the roof and the higher working places of the mine. Under ordinary conditions, when 1 part of marsh gas mixes with 5½ parts of air, the combination is at its lowest explosive limit. This explosive violence increases with the addition of air and reaches its maximum when a mixture of 1 part of marsh gas and 9½ parts

of air is reached; beyond this point the explosive violence decreases and becomes inert when a mixture of 1 of marsh gas and 13 of air is reached. An increase in atmospheric pressure will extend these limits. WHITE DAMP is carbon monoxide (CO); BLACK DAMP is carbon dioxide (CO₂); STINK DAMP, or sulphur gas, is hydrogen sulphide (H₂S), and AFTERDAMP is the mixture of gases formed by an explosion. See MINE GAS; METHANE.

FIRE DANCES. Dances performed around the fire, generally at night. Fire is almost universally associated with the home and hence with the family, and in the course of religious evolution the fire dance has gradually gained in importance. Whereas in Vedic India, e.g., we find the rite as a fertility charm performed at the solstice, among the American Indians it has developed into forms of war dances, of which the most important is the scalp dance. In Australia the Corroboree, performed in elaborate costumes, marks a further step towards the purely mimetic dance and prepares the way for pantomimic drama, the earliest form of the art as it is found among the aborigines of that continent. Rising higher in the art scale, the fire dance becomes a simple recreation of more or less elaborate character, as is typified in dances around ordinary bonfires. A highly developed form of the fire dance exists on the modern stage where the firelight is represented by calciums of different colors. See FIRE WORSHIP; SKIRT DANCES.

FIRE EATING. A name usually given to a variety of feats performed by jugglers with flaming substances, melted lead, red-hot metal, etc. Many feats of this kind are undoubtedly mere tricks, or illusions, produced by sleight of hand; others are capable of scientific explanation. There is nothing more wonderful in stuffing blazing tow into the mouth—a common form of mountebank fire eating—than in eating flaming plum pudding, or in dipping a finger into spirits and letting it burn like a candle. It is well known, too, that the tongue or the hand, dipped in water, may be rubbed with impunity against a white-hot bar of iron; the layer of vapor developing between the hot metal and the skin prevents contact and produces coolness. Certain kinds of these performances are explained by the well-known power of the living body to maintain its normal temperature for a time, independently of the external temperature.

FIRE ENGINE. A machine employed for throwing a jet of water for the purpose of extinguishing fire. Machines for the extinguishing of fires have been used from a very early date. They were employed by the Romans, and are referred to by Pliny; but he gives no account of their construction. Apollodorus, architect to the Emperor Trajan, speaks of leathern bags, with pipes attached, from which water was projected by squeezing the bags. Hero of Alexandria, in his *Treatise on Pneumatics* (written probably about 150 B.C.), proposition 27, describes a machine which he calls "the siphons used in conflagrations." It consists of two cylinders and pistons connected by a reciprocating beam, which raises and lowers the pistons alternately, and thus, with the aid of valves opening only towards the jet, projects the water from it, but not in a continuous stream, as the pressure ceases at each alternation of stroke.

A device with two pumps, worked by levers, is

said to have been invented in Egypt in the second century B.C. Apparatus called "instruments for fires" and "water syringes useful for fires" are described in the building accounts of the city of Augsburg, 1618. In 1657 Kaspar Schott described a fire engine used in Nuremberg, invented by one Hans Hautsch, apparently similar to that described by Hero. It had a water cistern, was drawn by two horses, was worked by 28 men, and threw a jet of water an inch in diameter to a height of 80 feet. It was not until late in the seventeenth century that the air chamber and hose were added, the first being mentioned by Perrault in 1684, and the hose and suction pipe being invented by Van der Heide in 1670. In England small brass hand squirts were used up to the close of the sixteenth century, while a work published in England about 1634 describes in detail "divers quirts and petty engines to be drawn upon wheels from place to place for to quench fier among building; the use whereof hath been found very commodious and profitable in cities and great townes." Paris had fire engines of some sort at the beginning of the eighteenth century. In England, in 1734, engines of various construction were manufactured; for previously a law passed in the sixth year of Queen Anne's reign provided that "each parish shall keep a large engine and an hand engine, and a leather pipe, and socket of the same size as the plug or fire cock [of the water mains] that the socket may be put into the pipe to convey the water to the engine." The most successful early English fire engines were those invented by Newsham, but previous to 1686 the engine for extinguishing fire was claimed as an English invention. Two of his machines—the first invention of the kind ever used in this country—were introduced in New York in 1731. It was more than 50 years after this that the leather valves within the cylinders were superseded by metallic valves, placed in valve chests apart from the cylinders and the air chamber. Rotary and semirotary pumps were also introduced. Hand fire pumps drawn by men and horses were used until the advent of the steam fire engine both in Europe and America. In the latter country they figured in the exciting and picturesque days of the volunteer fire departments and are still employed in some small towns, though they are gradually being supplanted with the more general introduction of water supply and small gasoline motors. Floating fire engines worked by hand were used on the Thames before the close of the eighteenth century. In some cases the mechanism that worked the pumps was used to move the paddle wheels. It was not until 1850 that floating fire engines worked by steam came into use in England.

So far as known, the first steam fire engine was developed by Brathwaite in 1820 or 1830. John Ericsson (q.v.) worked on the problem about the same time, and is credited by one writer as having built such an engine with Brathwaite, in London, in 1830, and also with having built one in New York in 1840, very soon after he had come to America. In 1841 an engine was built in New York after plans by Hodge, probably as the result of a competition after the great fire of 1835. This engine was operated occasionally by or for insurance companies, but neither it nor the earlier London engine was satisfactory. In 1850 A. B. Latta, in Cincinnati, produced the first machine which was practically useful. Cincinnati was the first

city in the United States to organize a steam fire department, but other large cities and towns rapidly followed the example. In 1872 self-propelled steam fire engines were delivered to both New York and Boston, and in 1873 one was delivered to Detroit. From 1872 to 1898 about 20 similar engines were bought by American cities. The more usual practice, however, was to use steam fire engines drawn by two or three horses, but recently such apparatus is being in large part supplanted by motor pumping engines where gasoline engines supply power both for propulsion and operating the pumps. Such machines have now become quite general and are considered approved practice for fire departments in all parts of the world. Nevertheless the introduction of motor apparatus was for a time quite slow, as it required to be demonstrated that motor-driven machines could be as reliable as the marvelously trained horses of American fire departments. Perhaps the complete triumph for motor fire apparatus was scored in its selection for the fire protection of the Panama-Pacific International Exhibition, when such machines were installed in 1914 in the model fire houses on its grounds.

The main parts of the steam fire engine are the boiler, engine, pumps, and the frame and vehicle on which these are mounted. Boilers are generally of the vertical water-tube type designed for rapid steaming. The engines and pumps are also generally vertical, double-acting, and in duplicate. In some machines both rotary steam and water cylinders, instead of the more common steam pistons and water plungers or reciprocating engines, were employed, while certain light machines had horizontal engines and pumps. To facilitate the readiness of steam fire engines for immediate service, heaters are maintained in the engine house to give a constant supply of steam or hot water to the engines. When the alarm strikes, the boiler pipe connecting with the heater is disconnected, a fire of cannel or other soft coal beneath the boiler is kindled by means of excelsior and dry wood, and steam is soon available as the fire engine proceeds to the fire. The rated capacity of steam fire engines ranges from about 1300 to 400 gallons per minute, and their weights from 11,000 to 5000 pounds. The largest, or extra-first size, steam fire engines now in service have a pumping capacity in excess of 1300 gallons per minute and weigh with water in the boiler about 11,000 pounds. They require three horses to draw them under ordinary conditions.

As soon as horse-drawn steam fire engines had been developed to standard types, attempts were made to utilize the steam in the boiler for propulsion as well as pumping. A number of these engines were adapted to be propelled by power from the main crank shaft, through two chains running over sprocket wheels on the rear wheels of the fire engine. The driver steered the engine by means of a hand wheel and rod connected with the front axle through a bevel and worm gearing. By the removal of a key the road-driving mechanism could be disconnected, whereupon the power became available for the pumps. These self-propelled steam fire engines never enjoyed a wide vogue, and in most fire departments horse-drawn apparatus was considered more serviceable and reliable.

Steam fire engines usually are rated on the basis of their capacity, but it must be remembered that the amount of water discharged

depends upon the pressure at the pump, and with an increase of pressure the rate of discharge falls rapidly. The usual ratings of fire engines in American practice are as follows:

STEAM FIRE ENGINE RATING AND CAPACITIES

Rating	Gals. per min.	Per ½ hr.	Per hr.
Double Extra First. . .	1300	39,000	78,000
Extra First.	1100	33,000	66,000
First.	900	27,000	54,000
Second.	700	21,000	42,000
Third.	600	18,000	36,000
Fourth.	500	15,000	30,000
Fifth.	400	12,000	24,000

Possibly the standard size for most American fire departments is the second-size engine, and tests made in Chicago in April, 1912, of three new second-size steam fire engines were considered fairly representative of the capacity of machines of this size. The capacity tests referred to continued for an hour and showed an average discharge for the three engines of 725 gallons per minute at a net pump pressure of 157 pounds. When the pressure at the pump was increased to 275 pounds net, an hour's test showed an average discharge of 409 gallons per minute. The net horse power developed at the pump during the various tests ranged from 61 to 72, an average of 66½.

In this age of self-propelled vehicles the horse-drawn steam fire engine is passing, and in the interests of efficiency and economy is giving place to motor-driven apparatus which, while not entirely perfected, is being developed to an ever-increasing point of efficiency. Self-propelled fire apparatus has passed the experimental stage, and motors and tractors have been developed to a degree where they answer all responsible needs of power, speed, efficiency, and economy. While the well-trained horses not only were picturesque, but were efficient and faithful to a high degree, yet it must be remembered that a large part of the time they were absolutely idle and were performing no useful work in return for their forage and care. Their presence in the engine house required space for their stabling, bedding, and feed and made the building less attractive and sanitary for the firemen living in it. With gasoline motor apparatus there is no consumption of fuel except when it is actually in motion and operation, and the fuel and lubricating oil are inconsequential in comparison with the cost of forage, bedding, shoeing, harness, and veterinary attendance, not to mention the more rapid depreciation of live stock.

In the transitional period from the supplanting of the steam fire engine to the motor machine, the first general step has been the elimination of the horses and the substitution of some form of tractor at the front wheels. In place of the horse-draft gear, three and four wheeled tractors have been placed under the fifth wheel of an ordinary steam fire engine, as well as other apparatus, and have answered admirably, while special forms have been developed, such as the front-drive tractor used in the New York, Pittsburgh, Manila, and other fire departments, where a special form of motor fitted to the front wheels has been added to the lengthened frame of a steam fire engine. Another form of tractor for steam fire engines consisted

of a couple-gear arrangement where storage batteries furnish current to motors placed at the front wheels. Steam fire engines have been motorized in many other ways and have been used to great advantage.

It must be remembered that the firemen of most large American fire departments are thoroughly conversant with the operation of the steam fire engine, which has proved thoroughly reliable and susceptible of regulation, and in addition is able to thaw out with its steam frozen hydrants, an important consideration for cities with severe winters. Records have been made of steam fire engines operating continuously over 72 hours, while a capacity up to 1600 gallons per minute has been obtained. As showing the endurance of a steam fire engine, it may be stated that a record of three months' constant operation in service was made from Nov. 18, 1913, to Feb. 18, 1914, during which time the machine was shut down twice to replace burned-out grates, three times to replace broken valve springs and overhaul valves, and once to replace a broken piston follower.

In regard to motor pumping engines, as desirable as they are, progress, while rapid, had not reached a point where in 1914 such machines had secured universal acceptance in the large fire departments. The New York City fire department, e.g., has never been willing to purchase motor fire engines unless the standards set for second-size steam fire engine could be met, although it has installed a number of motor-driven steamers of this size. The motor fire engines consist of pumps driven from the main engine shaft, which is connected with the propelling mechanism by a system of gears to reduce its rapid revolution to a useful speed for reciprocating pumps or to a less extent for rotary pumps. In the smaller sizes of motor pumping fire engines, especially those available for village and suburban use, machines of remarkable usefulness and efficiency have been secured. These are fitted either with reciprocating or rotary pumps and carry a reasonable amount of hose and other equipment, including sometimes chemical tanks which are ready for use at a moment's notice. Such a machine, having a speed up to 40 miles an hour, or far in excess of any ordinary requirements, can be maintained at a central point in a village with a minimum of regular employees in attendance and be available for service over a wide territory. Even for a city such an engine is able to deal with incipient fire, if not through its chemical tanks, by means of a stream of water promptly applied. These machines were brought out first about 1907, and since that time have been developed and put in extensive use.

At first, insurance officials favored piston reciprocating pumps, and consequently the rapid rotary motion of the shaft had to be reduced by appropriate gearing or chain drives. Although plenty of power was available, this process was not marked by efficiency, and at the higher pressures the pumping capacity of many motor fire engines, due to excessive slip and other causes, was limited. Mechanical engineers, however, mindful of the success of centrifugal and rotary pumps in other fields, endeavored to perfect this form of mechanism in the motor pumping engine, and gradually increased efficiency was secured, so that a demonstration test to show endurance, reliability, and capacity, which took place at New York in connection with

the annual convention of the International Association of Fire Engineers in 1913, brought out 11 motor pumping engines, of which three were able to pump for the entire period of 12 hours assigned for the test. Two operated for 10 hours steadily, two for 9 hours without cessation, and one for 8 hours. At these tests a Seagrave motor pump, rated at 1000 gallons per minute capacity, discharged at 125 pounds' pump pressure at a rate of 1049 gallons per minute; at 204 pounds' pressure, 595 gallons per minute; and at 256 pounds' pressure, 323 gallons per minute. An American La France motor pump, rated at 1400 gallons' capacity, at 132 pounds' pump pressure, discharged at the rate of 1402 gallons per minute; at 209 pounds' pressure, 734 gallons; and at 288 pounds' pressure, 626 gallons. An even better record for endurance than this was made a few months later, when a motor engine drafting water from a distance of 24 feet worked for 24 hours without stopping.

Fire Boats. To protect the water front and harbors of cities where fire is apt to have the most disastrous effects on piers, warehouses, and especially lumber yards and factories, floating fire engines in the form of fire boats are generally employed, and their design and construction have resulted in excellent types of marine engineering. In such a fire boat, pumping capacity must be combined with reasonable speed and ease of manœuvring, as the boat must nose its way into slips and take up a position adjoining a bulkhead or wharf from which it can deliver through turret nozzles and standpipes vast quantities of harbor water. These fire boats are maintained constantly under steam and respond to alarms just as an ordinary land company. In many cases their powerful pumps make them available for service at fires quite a little distance inland, as heavy hose may be laid from the waterside to the scene of the fire, while it is also usual with high-pressure systems to provide for the connection of the pumps of the fire boat with the main system to supplement the pumps of the central station when necessary. Various forms of pumping machinery have been installed on such fire boats, the earliest of which were equipped with double-cylinder, vertical, inverted, reciprocating pumps, each of which might have a capacity as large as 3000 gallons per minute. With higher steam pressures the centrifugal pump either directly driven by means of steam turbines or by some form of electric drive with generators and motors has been found well adapted for this service. In the New York fire department there were in service, in 1914, 11 fire boats, three of which were equipped with centrifugal pumps, the largest of which was 326 tons, 131 feet in length and 28 feet beam, with a pump capacity of 9000 gallons per minute.

At the great iron-ore docks at Duluth, Minn., belonging to the Duluth, Missabe, and Northern Railway, a powerful fire boat, the *William A. McGonagle*, is maintained with pumps able to deliver 12,000 gallons per minute at a pressure of 150 pounds under ordinary conditions. This boat is 120 feet in length, 28 feet molded beam, and is driven by a double, vertical, high-pressure engine with cylinders each 20 inches in diameter by 24 inches' stroke. The pumping equipment consists of two sets of two-stage centrifugal pumps, each driven by an 800-horse-power horizontal-shaft Curtis steam turbine, the two sets

so arranged that they can be operated in series and a pressure of 300 pounds per square inch obtained. For the San Francisco fire department two fire boats, each 129 feet in length and 26 feet beam, are maintained with steam turbines connected each to two multistage centrifugal pumps, each set capable of delivering 4500 gallons per minute at 150 pounds' pressure, or half this amount at 300 pounds' pressure. The fire boats of Chicago are somewhat different in that both the pumping machinery and propelling motors are electrically driven, two 660-horsepower Curtis turbines being directly connected to 200-kilowatt direct-current generators and two-stage centrifugal pumps and propelling motors. These fire boats can deliver at an emergency between 10,000 and 11,000 gallons of water per minute at 150 pounds' pressure. Philadelphia, Boston, Seattle, Detroit, and other cities all maintain large and efficient fire boats, and the details of construction have been worked out with considerable skill. Often local conditions have governed and a boat of light draft is required. The equipment consists usually of a turret mast and a number of turret pipes, and there is stowage capacity for a large amount of heavy 3 or 3½ inch hose.

Chemical fire engines and extinguishers range all the way from apparatus mounted on wheels and drawn by men or horses, and an integral part of a hose tender or special motor car, to small tanks carried on a fireman's back, or small hand force pumps. The aim of all such devices is to smother the fire by means of some gas, such as carbonic-acid gas. The larger and more effective apparatus include a generating tank or tanks, possibly as large as 45 gallons' capacity, in which water and soda are placed, with an agitator to aid in dissolving the soda, an acid-feeding chamber, and some 200 or 250 feet of ¾ or 1 inch hose carried in a basket or on a reel. If the generating apparatus is in duplicate, with proper hose connections, continuous streams may be thrown; otherwise the stream will cease while recharging is in progress. The water serves as a medium to carry the gas, and the gas is the motive force for the water. Small quantities of water are required as compared with fire engines, thus permitting a relatively light apparatus and small and easily managed hose. For incipient fires, or some of those where water is inefficient, the chemical apparatus is very useful, and for that reason it is often mounted on a high-speed motor car, which may, in addition, carry the hose supply for a following fire engine as well as useful tools and appliances for the firemen, this being a most advantageous arrangement, and may be employed to advantage in some cases where the cost of steam or motor pumping fire engines is prohibitive, or where the local water pressure is adequate in connection with the transportation of the firemen. See **FIRE EXTINGUISHER**; **FIRE PROTECTION, MUNICIPAL**.

FIRE ESCAPE. A stationary or portable device to enable people to escape from burning buildings when ordinary means of egress to the ground are destroyed or cut off by flames, and also, a point less often considered, to enable the firemen to reach the seat of the fire. In England the term is applied to a portable extension ladder that may be wheeled up to a building on fire to furnish a means of egress to the occupants. The fire escape most used in America, and usually required by city building laws, consists of

balconies attached one above another to the outside of the building, connected by iron ladders with each other, and opening on to each floor at a door or window. Such fire escapes are made entirely of iron, and one or more of them may be used according to the size of the building, though in most cases they leave much to be desired. Modern conditions of building and fire hazard have led to the adoption of inclosed fire towers or fire and smoke proof stairways independent of the main building, from which access may be had from each floor by long outside balconies or by entrances cut off by fire-resisting doors. These towers have stairs with broad treads and handrails and are designed to effect the rapid emptying of the building. Sometimes these towers are of steel only partially inclosed, but communicating with balconies at each floor. Portable fire escapes may be operated from the interior of the building or from the outside, according to their character. Interior fire escapes of this class vary in character from a simple knotted rope placed in each room, and down which the person seeking escape slides, to more elaborate devices, like canvas tubes, spiral chutes, cables with slings, etc. Portable fire escapes operated from the outside consist of ladders, telescopic tubes carrying slings, cables which may be thrown up into open windows, etc. One of the most practical and effective of all of these devices is a simple ladder of sufficient length to reach from one story to the next, and provided with large hooks at one end which may be inserted over the window sill. The first ladder is placed from the ground, the second from the top of the first, and so on until a line of ladders extends from the ground to the top floor, down which the occupants of the building may descend alone or be carried by the firemen. The efficiency of all these devices in saving life depends largely upon the coolness and self-possession of the endangered persons and those who are trying to aid them, and upon the device being maintained in working order, a matter that is often neglected. For these reasons various authorities on fire protection are coming more and more to advocate that reliance on safety from fire should be placed on fireproof construction, aided by the use of stationary fire escapes of the first kind described and the frequent instruction and drill of the occupants of the building in leaving in orderly ranks without panic or confusion. See **FIREPROOF CONSTRUCTION**.

FIRE EXTINGUISHER, or FIRE ANNIHILATOR. An apparatus by means of which fire may be extinguished, usually by spraying on it certain liquids or water charged with a gas that is incapable of supporting combustion, especially carbon dioxide (q.v.). An extinguisher of this character was originally brought into successful use in London in 1816, and a patent was applied for in the United States for a similar apparatus by William A. Graham in 1837. These extinguishers are strong metal cylinders of convenient size, partly filled with a solution of soluble carbonate, usually bicarbonate of soda. In the upper part of the cylinder is placed a glass receptacle, containing sulphuric acid, closed with a loosely fitting stopper. When the apparatus is to be used, the cylinder is inverted and the acid mingles with the carbonate solution. By decomposition carbon dioxide is generated in sufficient quantity to saturate the liquid and produce considerable internal pressure. The

result of this pressure is the forcing of the carbonated liquid through a short flexible nozzle which may be directed so as to envelop the burning material. In the early types the apparatus was carried on the back, and the discharge of acid and flow of the liquid were controlled by valves. At present these have been largely discarded. Large cylinders containing chemical salts have been mounted on wheels, for service on the floors of large establishments, or, still larger, they are known as "chemical fire engines," and are used in many of the larger cities. (See FIRE ENGINE.) For the extinguishing of fire on shipboard a series of pipes have been arranged on the upper deck that communicates with the various compartments of the vessel, as the coal bunkers, the hold, the main deck, etc. Chemical agents are placed in the receptacle, to which steam may be admitted, and in case of fire the steam mingles with the carbon dioxide, and the two are conveyed to the place of danger, where they replace air, smother and finally extinguish the fire. Similar arrangements, known as sprinkler systems, in which water is released automatically when the temperature rises to the danger point, are in use in factories. In extinguishing fires caused by an electric current care must be taken not to use any solution which will conduct electricity. Extinguishers charged with chloroform or carbon tetrachloride mixtures may be used.

Hand Grenades, or bombs filled with fire-extinguishing solutions of chlorine or ammonium chloride, borax, mixtures of calcium chloride, magnesium sulphate, sodium carbonate, sodium chloride, and sodium silicate, are in common use; but they are of value only in the first stages of a fire. See FIRE ENGINE; FIRE PROTECTION.

FIREFLY. The name of many luminous beetles of the families Lampyridæ and Elateridæ, the former of which is known as the firefly or lightning-bug family. The Lampyridæ are pentamerous beetles of small size and soft texture, with the head frequently hidden under the prothorax, but sometimes prominent and with serrate antennæ; the elytra are soft and yielding, are often abbreviated, and in some genera totally wanting in the females, which are wingless, and larvæ-like in other respects. These and the true larvæ are called glowworms and are often more luminous than the adult male lightning bugs. "The larvæ are flattened, often dark-colored and velvety, and have an ocellus on each side of the retractile head; they are generally carnivorous, living under stones and bark, and upon the ground, where they devour snails and larvæ of insects. Sometimes the velvety larvæ of certain species of *Telephorus* wander about upon the snow, giving rise to stories of showers of worms."

The family Lampyridæ is confined to warm or tropical lands and is very abundant in southern Europe and in most parts of the United States. Fireflies are gregarious, and their luminosity is most evident on warm, dark nights. The light-giving part is situated ordinarily on the sides of the abdomen, and the light is greenish white, like phosphorescence; but in South America there is a remarkable form, probably a female of the group *Phengodini*, which flashes a red light at each end of the body and a green light along the sides, suggesting signals, so that it is known in Paraguay as the railway beetle. The emission of light by the lampyrid lightning bugs

and glowworms is intermittent, but at definite intervals, in one case averaging about 36 flashes a minute, but this varies a little from night to night, perhaps with the temperature. The function of the light of Lampyridæ is unknown to us, but since many of the fireflies have unusually well-developed eyes, and since most of them are active at night, the flash would seem in some way to be important for the firefly. In some species of Lampyridæ not only both sexes, but the eggs, larvæ, and pupæ are luminous. A common species of lampyrid firefly in the eastern United States is *Photuris pennsylvanica*, about $\frac{1}{2}$ inch long, yellowish and obscurely striped; its luminous larva has a brushlike anal leg. A Western species is *Photuris pyralis*, which has brownish-black elytra margined with dull yellow, and whose larvæ live in the ground and feed upon worms. The most familiar European species is the common glowworm of England (*Lampyris noctiluca*), of which the blackish female, $\frac{1}{2}$ inch in length, is entirely wingless and without elytra and crawls about in the grass emitting a soft, steady light, occasionally interrupted. The males and the larvæ are also faintly luminous, the latter being noted for their voracity and their devouring of snails. In another genus, plentiful in southern Europe, both males and females are winged and luminous, the male giving a stronger light than the female.

Luminous Elaters. The second family that contains luminous beetles is the Elateridæ. These give forth at will a steady light and are all tropical American beetles of the genus *Pyrophorus*. There are about 100 species of this genus, but not all are luminous. These wonderful insects were seen and described by some of the early explorers of America, but even to-day only one form, the cucuyo (*Pyrophorus noctilucus*), has been studied. It has two yellowish "eyelike lamps" on each side of the prothorax through which light shines. The ventral surface of the abdomen is also strongly luminous, but this light is only evident when the insect is in flight. These beetles are frequently used as ornaments for the hair, especially in Vera Cruz. They are blackish brown and nearly 2 inches in length, so that one may believe the report that the Indians sometimes use them as lanterns.

The firefly produces light practically without loss of heat or chemical rays, but concerning the method of the production of this most economical light we know little. An account of what has been learned of the nature and purpose of this luminosity will be found in the article LUMINOSITY OF ANIMALS.

FIRE INSURANCE. It is impossible to determine just when a scientific system of insurance against loss by fire was first introduced. The principle of mutual aid in times of distress was embodied in many societies both in ancient and in mediæval times, and one of the generally recognized occasions for such aid arose when the property of a member was destroyed by fire. In the ordinances of the guilds of the later Middle Ages, e.g., we find regulations for the payment of a certain amount of indemnity to any member who suffered loss of property by fire. This amount was sometimes paid out of the funds of the guild, and was sometimes raised by a specific assessment on the other members. In neither case were the essential principles of insurance observed. There was no separation of the insurance fund from the other funds of the guild, and no payments to the guild by the mem-

bers based on the risk which the guild assumed. The indemnity bore no definite relation to the amount of loss, or to the amount which the members had paid to the guild, but was either fixed beforehand as a uniform sum or a uniform contribution from each member, or else was arbitrarily fixed by the guild itself after the loss had occurred.

England. The earliest recorded proposal for the establishment of a scientific fire-insurance company in England was made in 1635. The first office was opened by N. Barbon, in London, in 1667, the year after the great fire. It is highly probable that the business had already been introduced on the Continent. Barbon's method was that of individual underwriting. The first joint-stock association for insuring against loss by fire was established in 1681. The oldest surviving English company, the Hand in Hand, was founded in 1696. No less than five other existing English companies date back to 1720 or earlier.

United States. The first fire-insurance company in the United States was opened at Philadelphia in 1752 and incorporated in 1768. It was called the Philadelphia Contributionship for the Insurance of Houses from Loss by Fire. Benjamin Franklin was one of its first directors. This company still survives. It is a mutual company and writes only perpetual risks. Its business is confined to the State of Pennsylvania. The development of the fire-insurance business was slow at first, being greatly retarded by the financial and industrial disturbances due to the Revolution. Before the end of the eighteenth century, however, at least 30 charters had been granted to companies for carrying on the business. Among the oldest existing companies may be mentioned the Insurance Company of North America and the Insurance Company of the State of Pennsylvania, both located in Philadelphia and both incorporated in 1794; the Mutual Assurance Company of the City of Norwich (Conn.), which began business in 1795; and the Providence Washington Insurance Company, of Providence, R. I., incorporated in 1799. The oldest existing New York company was organized in 1806, and the oldest Massachusetts company in 1818. Thousands of charters have been granted to fire-insurance companies since the beginning of the nineteenth century, but many of them have never been used. In a general way the number of new companies established from year to year has varied with the general prosperity of the country, and every period of depression has seen the failure or withdrawal of a number of companies. The most trying time in the history of fire insurance in the United States during the last 50 years came in the early seventies. In October, 1871, as a result of the Chicago fire, insurance companies became liable for indemnities amounting to more than \$96,500,000. In November of the following year occurred the great Boston fire, which brought a loss of more than \$52,600,000 upon the companies. These two great losses, coming in quick succession, subjected all fire-insurance companies to great strain. More than 100 of them were forced to suspend operations, while many others found their surplus wiped out and their capital seriously imperiled. The Baltimore fire of 1904 involved losses to the companies estimated at \$60,000,000, and the San Francisco fire of 1906 involved about \$175,000,000 in losses to the companies. The fire-insurance companies

are so much stronger financially than they were in earlier decades, that comparatively few failures were occasioned by these two great catastrophies. The history of the last 100 years shows a nearly constant growth in the magnitude of the fire-insurance business, and a steady improvement in the financial standing of the companies. During the latter part of the nineteenth century the establishment of governmental supervision of insurance companies in many of the States, involving periodical reports from each company, and thus a great degree of publicity as to its financial condition, has done much to prevent reckless management on the part of the companies and to protect the interests of the insured.

It is impossible to obtain complete statistics of the number of fire-insurance companies in the United States or of the amount of business they transact. In a number of the States certain companies, especially the small mutuals, are exempted from the duty of reporting to the commissioner, and statistics about such companies are nowhere attainable. There are probably in the United States at the present time nearly or quite 2000 companies granting insurance against fire. Of this number, however, only about 150 are of any considerable size or operate over a large territory. The total amount of fire insurance carried by all the companies exceeds \$50,000,000,000. The average rate of premium in 1912 was practically \$8.90 for each \$100 of insurance. The aggregate premiums collected in 1912 by the companies reporting to the New York Insurance Department were \$454,943,419.

Some indication of the increase in the use of fire insurance by property owners may be gained from a comparison of the total fire loss for different periods with the losses sustained by the insurance companies during the same periods. The figures given in the *Spectator Year Book* for 1902 indicate that, in the decade 1881-90, 57.4 per cent of the total fire loss was covered by insurance, while, in the decade 1891-1900, 60.9 per cent of the total loss was thus covered. The following table, compiled from the reports made to the Insurance Department of the State of New York by companies operating in that State, which, it must be remembered, does not include companies not operating in the State, may serve to illustrate the growth of the business during the last 40 years of the nineteenth century and the early years of the twentieth century:

YEAR	Risks in force December 31	Premiums	Losses
1860	\$1,486,954,382.57	\$14,436,860.76	\$8,570,956.74
1870	4,149,473,784.00	37,916,905.23	22,476,300.70
1880	7,305,729,981.00	61,120,535.51	43,243,439.94
1890	15,272,785,000.00	104,706,417.51	57,026,230.29
1900	22,352,662,553.00	141,232,031.75	89,566,490.00
1912	51,202,402,351.00	454,943,419.00	157,923,447.07

Organization. Stock Companies.—Nearly all the fire-insurance companies in the United States are organized either as mutual companies or as joint-stock companies. There are a few organized as unincorporated associations of individuals, transacting business on the principle of the English Lloyds. The mutual companies are more than five times as numerous as the joint-stock companies, but the risks carried by the relatively small number of stock companies

are many times as great in amount as those carried in the mutual companies. The relation of the insured to the stock company is simple and definite. By paying the stipulated premium he becomes entitled to indemnity in case of loss by fire within a given time. He incurs no liability, but substitutes a certain and definite periodical payment for the possibility of a loss of uncertain amount. It is probably the element of certainty and definiteness that gives the stock companies a large part of their advantage over the mutual companies.

Mutual Companies.—The relation of a person insured in a mutual company to the company is by no means so simple as in the previous case. In the simplest form of mutual insurance the funds necessary to pay losses are raised by assessment after the losses have occurred. Under such a system neither profit nor loss can arise, as the assessments are made to cover only loss and expenses. Experience has shown, however, that it is extremely difficult to raise the required amount in this way, whenever losses are unusually heavy. The general custom among the older mutual companies at the present time, therefore, is to collect a part of the necessary funds by premiums paid in advance and to hold the insured responsible for such additional amounts as may be required to pay losses. The liability of the insured is, however, frequently limited to a certain amount or to a certain proportion of the cash premium. This liability varies in different companies from a sum equal to the premium to a sum equal to five times the premium and occasionally to an even greater sum. Many of the older companies have accumulated large surpluses, out of which they are able to pay any exceptional losses they may suffer, and in normal years to return to the insured in the form of dividends a very considerable part—not infrequently as high as 90 per cent—of the sum collected as premiums. In the Western States in recent years the mutual principle in fire insurance has manifested itself in the establishment of numerous "town" and "county" mutual companies. The activity of these companies is usually limited to a single town or county. They are very largely engaged in insuring the property of farmers. They act on a plan somewhat different from that of the older Eastern companies. Instead of keeping up rates and using the annual gain to accumulate a surplus or to increase dividends they establish comparatively low rates. On long-time insurance usually a small part of the premium is paid in cash and the rest is paid by premium notes. The liability of the insured is limited to the amount of the notes given by him. No payments have to be made on these notes unless the losses of the company compel it to make an assessment. At the expiration of the term of insurance the notes are canceled. In many of the States the companies are authorized to count these premium notes as the whole or a part of the legal reserve, and they are to that extent freed from the necessity of accumulating a cash reserve sufficient to reinsure outstanding risks.

Lloyds.—In the early nineties there were organized in the United States a large number of fire companies on the plan of the English Lloyds. Most of these companies were located in New York, where a special provision of the insurance law gave them a temporary advantage. A "Lloyds" is neither a joint-stock company nor, in most cases, a mutual company; it is rather a

partnership with limited liability. It is an unincorporated association of individuals, each of whom deposits a certain amount and assumes liability for a limited additional amount. In the English Lloyds, where marine insurance is written, each member of the association does his own underwriting, specifying how much, if any, liability he will assume on each risk offered. In the United States companies, on the other hand, the actual management of the business is put in the hands of an attorney, who writes the insurance. Each member of the association incurs liability on every risk written, in proportion to his share in the deposit fund. In case of loss the deposit fund, and, if necessary, the additional liability of the subscribers, may be drawn upon to meet it. There is no reason in the nature of things why an insurance company so organized should not be as strong as a stock company. As a matter of fact, the stability of the English Lloyds is above question. The essential thing is financial responsibility on the part of the members of the association. In a great majority of the American companies this has been lacking. Not only was the additional liability assumed by the members usually of no value, but the deposits themselves were frequently in the form of notes, on which it was found impossible to realize in case of need. In New York the Lloyds survived in large numbers only so long as they were able to escape the supervision of the Insurance Department. As soon as they were brought under the provisions of the General Insurance Law, most of them disappeared. Of the 125 companies in New York in 1895, not more than 17 were surviving in 1909. During the last few years, however, Lloyds have been appearing in considerable numbers in Chicago under the lax provisions of the Illinois insurance law. A person inclined to seek insurance in the Lloyds, on account of the low premium rates offered, needs to remember that unless the company is organized in a State in which the Lloyds are under careful supervision by the Insurance Department, he has no assurance of the stability of the association. The actual value of the assets of the company may be far below the nominal value. Moreover, as the association is not a corporation, a person having occasion to bring suit against it must resort to the courts of the State in which the association is located.

Foreign Companies. Foreign fire-insurance companies, chiefly British and German, write a considerable amount of business in the United States. Many of the States have laws requiring a deposit by foreign companies of other States before licensing them to do business in their borders. Several of the foreign companies have found it advantageous to do the whole or a part of their American business through subsidiary American companies. Sometimes such a company is directly established by the foreign company; sometimes the foreign company buys up an already established American company. More than 50 foreign companies are operating in the United States and write over a quarter of the entire fire business of the country. Partly on account of the tendency in some States to discriminate against the foreign companies, many of these companies show a disposition to contract rather than to expand their American business. Only two States—Connecticut and Kansas—actually discriminate between foreign companies and companies of other States. In

Kansas the tax is 4 per cent on the gross premiums of the former, and 2 per cent on similar premiums of the latter; Connecticut imposes a tax of 2 per cent on gross premiums of foreign companies and has for other-State American companies the reciprocal provision. But while the actual legislative discrimination against the foreign companies is not very widespread or very severe, the possibility of such legislation and the somewhat common advocacy of it tend to drive the companies away. About 20 such companies withdrew from the United States, either wholly or in part, in the five years 1901-05 and four more in the five years 1905-10.

Self-Insurance. When many pieces of property so situated as to constitute separate risks are owned by a single individual or corporation, the proprietor sometimes finds it cheaper to "carry his own insurance" than to have recourse to an insurance company. When a corporation adopts this plan of self-insurance, it usually sets aside an insurance fund, out of which any property destroyed by fire is to be replaced. The losses which are suffered fall wholly on the corporation; the insurance fund merely enables it to meet them without embarrassment. The prevalence of this custom of self-insurance against fire among large corporations constitutes a serious indictment of the management of fire-insurance companies. A part of the gain from a system of insurance comes from combining many separate risks in a single company, since the more risks the company carries (provided, of course, they are properly classified) the less fluctuation will there be in the amount of loss, and the smaller the reserve which will have to be maintained to prepare for unexpected losses. Consequently, however many risks of its own a corporation may be carrying, it should be to its advantage to combine them with as many other similar risks as possible. That so many large corporations find it cheaper to carry their own insurance can be explained in only one way—that the insurance companies charge more for the protection they give than is justified by the risk they assume. A slight extension of the principle of self-insurance is seen in the strictly mutual insurance companies often formed, composed of a small number of persons all engaged in some one line of business. Perhaps the best-known example of this kind of company is to be found in the so-called "mill" or "factory" mutuals of New England. Such a company consists of a limited number of persons or corporations engaged in some particular line of manufacture—as, e.g., the cotton manufacture—each of whom insures the whole or a part of the value of his mill in the company. Nearly all of these companies are very stringent in their requirements as to the protective measures to be adopted by their members. The adoption of these measures greatly reduces the danger of loss by fire and so lessens the degree of risk. These companies, however, like individuals, should be able to insure more cheaply in large insurance companies, if those companies charged no more for the business than the risk justified.

The Agency System. While fire-insurance companies were small and their activities were confined to limited areas, it was possible for all the business of any one of them to be done through a single office. With the growth of the business and the extension of the field of operation of the larger companies, the single-office system became cumbersome and unwieldy. To

meet the difficulty, the "agency system" was introduced, for a time tentatively and to a limited extent. It was first tried successfully on a large scale in the early fifties, by the Home Fire Insurance Company. It has since become practically universal among the large companies. Under the agency system the territory constituting the field of operation of an insurance company is divided into a number of departments, varying for the whole United States from 2 or 3 to 10 or 12 in number. Over each department is a general agent or manager, who is practically in charge of the business of his company throughout his department, subject to the general instructions received from the home office. The manager appoints and supervises two classes of subordinate agents—local agents, one or more in each locality where the company does business, and special agents, usually one for each State. The local agent is the one who solicits business and actually writes the insurance, making periodical reports to the general agent in charge of the department which includes the locality in which he works. That the local agent may have the greatest incentive to diligence in securing business, his remuneration takes the form of a commission on the premiums received. This method of payment has the disadvantage of putting the agent under a strong temptation to accept undesirable risks, or to secure business by improper methods, for the sake of obtaining his commissions. It is one of the field functions of the special agent, or "field man," to keep watch over the local agents and prevent them from sacrificing the welfare of the company to their own pecuniary interests. The special agent is paid a salary instead of commissions, and his chance of promotion lies in making a good showing for his district. His interests coincide with the interests of the company he represents.

That the agency system has been largely responsible for the great extension of fire insurance in the United States cannot be doubted. The method is, however, a very costly one. The direct cost in the form of commissions is enormous and is increasing from year to year. Thus, for the fire insurance written in the decade 1861-70 commissions amounted to \$11.21 for every \$100 of premiums; in 1871-80 they were \$14.61 per \$100 of premiums; in 1881-90, \$17.89; in 1891-1900 they varied from \$17.90 in 1894 to \$20 in 1900; and in the decade 1901-10 they ranged from \$20.28 in 1902 to \$21.89 in 1908. Moreover, this direct expense represents but a small part of the cost of the agency system. While the companies themselves are by no means entirely free from blame for the recklessness with which at times rates are cut and risks accepted, it is the uncontrollable zeal of the local agents for business and resulting commissions which usually inaugurates such a movement. The result of the movement is the acceptance of undesirable risks, or of desirable risks at too low a rate, a consequent diminution in the ratio of premiums to insurance written, and, when the effect of the poorer risks has made itself felt, an increase in the proportion of fire losses to insurance written, and finally the failure of weak companies and the depletion of the surplus of strong companies. The situation at length becomes intolerable, compelling a movement to restore rates to a paying basis, and general and special agents for a time exercise great care in their supervision of local

agents. The effect of the bad risks accepted during the period of rate cutting disappears after a year or two, and a period of prosperity follows, which lasts until the cycle starts anew. While local agents have done much good in extending insurance among people who would never have resorted to it unsolicited, and while it is difficult to conceive of any other system on which the business of a large company can be well carried on, still it must be acknowledged that the multiplicity of agents, the magnitude of their tax upon the insured, and the wide divergence between the interests of the agent on the one hand and those of the insurer and insured on the other, are very serious evils necessarily involved in the agency system.

Associations of Underwriters. The tendency to association on which the business of insurance is based is manifested in the formation of all sorts of unions and associations among those engaged in it. In the department of fire insurance these associations are especially numerous and have attracted much attention through the obvious attempts of some of them to replace competition by mutual agreement as a regulator of rates. There are in the United States more than 30 general associations of fire underwriters, some of them extending over many States, besides a considerable number of local associations, each confined to a particular city. Many of the forms of activity of these associations are universally recognized as legitimate. As examples of such activities, may be mentioned the offering of rewards for the apprehension of incendiaries, the inspection of fire departments and water works, and the organization and support of fire patrols.

Anticompact Laws. It is the attempt of the underwriters' associations to regulate rates and thus restrict competition which has attracted the most attention. The popular feeling has undoubtedly been that the rate agreements entered into by nominally competing companies through underwriters' associations have resulted in keeping premium rates illegitimately high. The discussion of the question how far competition affords a desirable regulator of rates in the insurance business belongs in the treatment of the general subject of insurance. It is of immediate interest at this point to notice the legislation against rate agreements which several States have enacted in recent years. Such laws are known as anticompact laws. The earliest one was passed in Ohio in 1885. This law prohibits not only agreements as to the rates to be charged for insuring against loss by fire, but even agreements as to the commissions to be paid to agents for securing business. Similar laws, so far as the control of rates is concerned, are now in force in 10 States besides Ohio—viz., Alabama, Georgia, Iowa, Louisiana, Michigan, Nebraska (declared unconstitutional by the United States District Court, and by the Supreme Court on appeal), New Hampshire, South Carolina, Washington, and Wisconsin. In four other States—viz., Arkansas, Kansas, Missouri, and Texas—such combinations are specifically included among those prohibited by general anti-trust laws. The anticompact movement apparently reached its height in the years 1897-99, no fewer than eight of the 15 laws in force having been passed during that time. In 1900 only one such law was passed, and none in 1901. In 1902 Virginia repealed the law which she had enacted in 1899. It is coming to be recognized

that the attempt to prevent rate compacts by prohibitory legislation cannot succeed, owing to the ease with which secret agreements can be entered into, and it is coming to be suspected that the condition of reckless underwriting which prevails when compacts are actually abolished may be a worse evil than the relatively high rates maintained by means of the agreements.

Relation of Insurance to Amount of Loss by Fire. Increase in Number of Fires Owing to Insurance. The relation of insurance to the amount of fire loss deserves careful consideration. Over against the great gain which the system of fire insurance confers upon society must be set a direct loss due to the increase in the amount of property destroyed by fire as a result of the insurance itself. A part of this increased loss is due to the greater carelessness of the owners because of the insurance; a larger part is due to the deliberate destruction of insured property by the owners for the sake of securing the insurance. What proportion of fires is due to incendiarism it is impossible to determine with accuracy. Various estimates, ranging from 20 to 40 per cent, have been made by different investigators. If fires of unknown origin are largely counted as incendiary, as there is a natural tendency to count them, the proportion is made unduly high. In Massachusetts, for a period of seven years just preceding the first appointment of a State fire marshal, which occurred in 1894, incendiary fires and those of unknown origin combined constituted 33½ per cent of the total number of fires. The proportion in most States is undoubtedly higher. It must be borne in mind, however, that by no means all incendiary fires are set for the purpose of obtaining insurance. In Massachusetts, e.g., in the four years for which statistics are available—viz., 1896, 1897, 1900, and 1901—out of a total of 1264 incendiary fires, only 408, or 32 per cent, were set for the insurance. During the same years incendiary fires constituted 7.1 per cent of the total number of fires in the State. On the basis of figures for Massachusetts, Ohio, and West Virginia, Mr. Frank Lock estimated that, of the loss of \$29,291,430 through fires of incendiary origin in 1912, 38.5 per cent, or \$11,277,200, represented fires set for the purpose of securing insurance money. Insurance fires, according to this estimate, amount to 5 per cent of all fires. The value of the property deliberately destroyed in order to obtain insurance constitutes one element in the cost of insurance. The insurance companies themselves are indirectly responsible for a part of this loss. It is a matter of common knowledge that agents and brokers show too great laxity in granting insurance on property up to, and sometimes far beyond, its full value. Every instance of over-insurance is a standing invitation to incendiarism. The extent of it is one of the unfortunate results of the zeal of local agents for business and commissions.

Preventive Activity of Insurance Companies. While a part of the annual loss by fire must be charged against the system of insurance, insurance companies must, on the other hand, be credited with a large share of the responsibility for the discovery and application of methods for preventing such loss. Not only have they always been active both in the adoption of preventive measures and in compelling or inducing the insured to adopt such measures, but it

is also to their initiative that a large part of the progress in State and municipal activity along the same lines has been due. As an example of direct preventive activity by fire-insurance companies themselves may be mentioned the maintenance of fire brigades and fire patrols. The early English companies laid great stress on the value of their services in extinguishing fires. Companies of "watermen," organized for this purpose, were supported at first by the individual companies and later by associations among the underwriters. It was not until 1866 that the maintenance and control of the London fire brigades passed from the hands of the underwriters to the municipalities. The English companies still support "salvage corps," whose duty it is to protect property from damage by fire or by the water used in extinguishing fires. Insurance companies in the United States have established organizations with duties similar to those of the English salvage corps. They are variously known as fire patrols, salvage corps, and protective associations. The earliest American association of that order was established in New York in 1839. Similar organizations are supported to-day by underwriters' associations in at least 30 of the larger American cities.

Of more importance than this direct preventive activity of insurance companies is the indirect influence which they exert through the pressure which they bring to bear on the insured. This pressure is exerted in some cases through the refusal of the company to accept the risk unless certain changes are made in the property which will lessen the danger of fire; more commonly through inserting in the policy that certain specified acts of the insured, of such a nature as to increase the risk, shall render the policy void, and almost universally by varying the premium rate in accordance with the number of preventive devices adopted by the insured. The introduction of automatic sprinklers into general use was directly due to such discrimination by insurance companies.

Fire Marshals. Finally, it is largely due to the agitation carried on by insurance companies that States and municipalities have adopted various measures for the purpose of preventing loss by fire. The more common forms of public action for this purpose are the maintenance of fire-extinguishing organizations, and the adoption of regulations concerning the storage of explosives and other dangerous commodities, and regulations as to the character of material to be used in the construction of buildings. A more recent movement in the same direction is the adoption of laws for the appointment of State fire marshals. Local fire marshals or other similar officers have long been maintained in the larger cities. The first State fire marshals were authorized by Massachusetts and Maryland in 1894. Their example was followed by Ohio (1900), Connecticut (1901), and Washington (1901). Since 1901 a number of other States have established the office of fire marshal, and systematic efforts have been made to bring about a uniformity of State laws on the subject. In 1902 Massachusetts transferred the duties of the fire marshal to the district police. In Mississippi the insurance commissioner acts as fire marshal. Along with the establishment of the office of fire marshal has gone the adoption of laws requiring investigation into the origin of fires. Maine and Pennsylvania, as well as the

States mentioned above, require such official investigation. Much light will undoubtedly be thrown upon the causes of fires by these investigations, and more intelligent action will be possible for the purpose of diminishing their number and destructiveness.

The duty of State and municipality to adopt regulations for the purpose of minimizing fire losses is too obvious to need discussion. When the carelessness or misconduct of one individual may result in irreparable losses to others who have themselves taken all due precautions, the State is clearly justified in doing all in its power to ward off the danger. What municipalities have done is but a small part of what they might properly do, and what they may be expected to do as more enlightened views of their responsibility in the matter come to prevail.

Technique. The Risk. The proper business of insurance companies is not the prevention of loss by fire, but the assumption of risk. Through an insurance policy the risk to which the property of the insured is exposed is assumed by the insuring company. Insurance in itself may have no effect on the amount of property destroyed by fire, or upon the chance of destruction to which a particular piece of property is exposed. The gain conferred by insurance upon society arises partly from the reduction in the uncertainty as to how much loss will be suffered in a given period through the accumulation of a large number of risks, and partly from a distribution of the losses actually suffered among a large number of individuals. The risk which an insurance company assumes when it insures a piece of property against loss by fire depends upon several factors; viz., the value of the property insured, the probability of fire within a given time, the probable destructiveness of the fire if it occurs, and the length of time for which the insurance is granted. The first and last of these factors are determined with comparative ease and accuracy. The determination of the second and third, on the other hand, presents very great difficulty. So far as human intelligence is concerned, it is largely a matter of chance whether a particular building is visited by fire in a given year or not. The adoption of preventive measures may reduce the probability, but some degree of uncertainty will always remain. And when there is added to that uncertainty the uncertainty as to the extent of the loss occasioned by the fire, it will be seen that there is a large element of chance in the liability which the company assumes so far as any particular property is concerned. Moreover, the uncertainty is of such a nature that the chance of loss cannot be determined by the most careful examination of the property. The knowledge of the conditions affecting the possibility of fire is too imperfect to admit of such direct determination. It is necessary, therefore, to rely upon the statistics of past experience to show what chance of loss a particular risk brings upon the company. If statistics show that each year for a number of years fire has destroyed, upon the average, one out of every thousand buildings of a certain kind, there is one chance in a thousand that any particular building of the same character will be destroyed during the following year. The greater the number of cases from which the average is calculated, the more reliable is the average—i.e., the less danger is there that it has been unduly affected by temporary fluctuations in the number of fires. The experience of

insurance companies themselves furnishes the most valuable data obtainable for calculating average losses. It is extremely desirable that the movement already under way to combine the experience of many companies, and thus calculate combined experience tables for fire insurance, as they have already been calculated for life insurance, should be carried out.

But even with the help of experience, the problem of calculating the risk incurred by insuring a particular building is by no means simple. In the first place, the probable destructiveness of the fire must be determined from experience as well as the probability of the occurrence of the fire. In the second place, the problem is made more complex from the fact that no two pieces of property present precisely the same fire features, if the term may be used. To group them in classes at all it is necessary to overlook many minor points which may still have some influence on the degree of risk. Even when this is done, the necessary number of classes is very great. The Home Insurance Company, which has kept a careful record of its fire experience during an existence of nearly 50 years, has found it necessary to make more than 150 classes of risks. The process of arranging risks in groups according to the chance of loss to which they are exposed is known as the classification of risks. It is a matter of great importance that this classification should be as accurate as possible. It is of importance to the companies, because a general underestimating of risks must result in loss to them; it is of importance to the insured, because imperfect classification means an unjust distribution of the burden of insurance. If any kind of property is put in a more hazardous class than it properly belongs in, the owners of that property contribute more than their share to the cost of insurance. Farmers, as a class, e.g., believe that farm property is thus unjustly classified by the large insurance companies, and that rates on such property are higher than they should be. It is that belief which is partly responsible for the spread of small mutual companies among them. The fire experience of these mutual companies lends some support to this claim.

The Policy. The terms of the insurance contract are set forth in the policy. In the early days of fire underwriting there was great diversity in the forms of policies, and considerable uncertainty in consequence as to their provisions. Underwriters' associations began early to urge the adoption of a common form of policy for fire insurance, and more recently the legislatures of the various States have taken the matter under consideration. Fifteen States now have laws describing the form of policy to be used in writing fire insurance within their borders. Massachusetts adopted a standard form in 1873, New Hampshire in 1885, New York in 1886. The other 12 States have since adopted the New York form, sometimes with minor variations. Moreover, the large companies have introduced the New York standard policy into many States where its use is not compulsory, so that a uniform policy is now written by them in nearly all parts of the United States. This policy contains, among other things, very clear and precise statements as to the limitation of the liability of the insurer, as to acts of the insured which will cause the policy to become void, and as to the necessary procedure by the insured in proving a claim to indemnity in case of loss. To give

some degree of flexibility to the policy, a series of riders has been prepared, which the companies are in many States authorized to attach to the policy, and which thus become a part of the contract.

Termination of the Policy. A fire-insurance contract may be terminated in any one of four ways. It may be made void by the failure of the insured to live up to the conditions contained in the policy; the time for which the insurance is granted may expire, when all liability of the insurer ceases; the policy may be canceled at the request of either insurer or insured; or, finally, the insured property may be destroyed by fire and the payment of the indemnity by the insurer to the insured terminate the contractual relations between them. The first three methods are simple, and need no comment. Trouble arises only in the settlement of claims for indemnity. Not to speak of the somewhat elaborate formalities to be observed by the insured in proving the amount of loss he has suffered, disputes often arise as to the amount of the liability of the company. In States where there is no legal regulation prohibiting such an arrangement, the policy usually provides that the liability of the company shall be limited to the actual value of the property destroyed. Even in case of total loss the insurer cannot recover the total amount named in the face of his policy unless he can prove that his property at the time of the fire was worth that amount.

Valued-Policy Laws. Partly on account of the injustice involved in collecting premiums on a larger amount of insurance than the company is ready to pay even for a total loss, and partly because of the tendency to laxness in appraising property for insurance under this system, several States have passed so-called "valued-policy" laws. These laws do not apply to movable property, for reasons easily discerned. In the case of fixed or immovable property, valued-policy laws provide that, in the absence of fraud on the part of the insured, the company must pay the full amount of the face of the policy in case of total loss. In some States, however, allowance may be made for depreciation in the value of the property between the time of insurance and the time of loss; while in others allowance is made for any change in the property during that time of such a character as to increase the risk. Wisconsin was the first State to pass a valued-policy law, which it did in 1874. Nineteen other States and Territories have since passed similar laws. Several other legislatures have also passed them, only to have them vetoed by the governors. Of the eight bills passed during the years 1899-1901, no less than five were vetoed. Insurance companies have opposed the passage of such laws, and resisted them when passed, so far as possible. In the case of the Missouri law they went to the United States Supreme Court on the question of its constitutionality. The court declared it constitutional. In the absence of legislation, when the same property is insured in several companies, the insured can recover only the actual value of the property destroyed. The various companies pay such a part of the indemnity as the insurance they are carrying constitutes of the total amount of insurance on the property. In most States having valued-policy laws, however, the amount of insurance stated in the face of each policy must be paid in the case of total loss of immovable property.

Surplus Insurance. A special form of insurance known as surplus insurance is sometimes written. This is sold under the condition that the company granting it does not become liable for indemnity in case of fire, unless the loss of property is so great that the entire amount of regular insurance fails to cover it. Such surplus insurance is furnished at rates below those charged for regular insurance, since in most cases of partial loss the regular insurance is enough to cover the loss, and the company furnishing surplus insurance escapes liability.

Coinurance. A large proportion of fires result in only partial losses to insured property. In the absence of any stipulation to the contrary, a partial loss must be paid in full, provided it does not exceed the amount of the insurance. There are two unfortunate results of this arrangement. One is that it increases the complexity of the calculation which an insurance company must make in estimating the risks it assumes. The other is that in the long run persons insuring their property for a small part of its value gain at the expense of those carrying insurance more nearly equal to the value of their property. If, e.g., of two similar pieces of property, each worth \$10,000, one is insured for \$4000 and the other for \$8000, the premium paid by the owner of the former property is only one-half of that paid by the owner of the latter. If now each piece is damaged by fire to the extent of \$3000, each owner recovers the full amount of the loss. The ratio of premium to indemnity is therefore twice as great in the one case as in the other. There are two possible remedies: The premium rate might be lowered as the ratio of insurance to value was increased, since the actual risk for \$1000 insurance diminishes *pari passu*. A very different remedy is usually adopted, however, known as coinurance. A coinurance clause attached to a fire policy stipulates that the owner of insured property must insure for a certain percentage—usually 80 per cent—of its value; or, if he carries less insurance, must be held to be his own insurer for the difference between the amount carried and the 80 per cent. This provision has no effect upon the amount of the indemnity received in the case of total loss. In the case of partial loss, however, it does away with the discrimination in rates in favor of small insurance. To recur to the example already used, the two pieces of property, each worth \$10,000, must, in accordance with the coinurance clause, be insured for \$8000. The owner who has only \$4000 of insurance is considered to carry his own insurance for the other \$4000. If the two pieces of property were totally destroyed, each owner would receive as indemnity the amount stated in the face of the policy, and the ratio of premium to indemnity would be the same in the two cases. If, on the other hand, each piece of property was damaged to the extent of \$3000, the owner carrying only \$4000 of insurance would receive but \$1500 of indemnity, since, as self-insurer for one-half of the required 80 per cent, he must bear one-half the loss. The other owner, having insured his property for the full 80 per cent, would receive the full \$3000 from the insurance company. In this way the ratio of premium to indemnity is made uniform in the two cases. The principle of coinurance is that the entire property at risk should bear the burden of the loss of any part of it. It is a principle long familiar in marine insurance under the name of

"average." It is applied to all fire-insurance policies issued in France, Germany, Belgium, and Russia. It is clearly in the interests of justice, since it brings about a more equitable distribution of the cost of insurance.

Anticoinsurance Legislation. In spite of all these facts, the attempt to introduce such a clause into fire-insurance policies in the United States has met with great opposition. It was first used to any extent in 1892, and as early as 1893 three States passed laws prohibiting its use. These States were Missouri, Tennessee, and Maine. (Maine repealed the law in 1895.) Similar laws have since been enacted by nine other States, in the following order: Louisiana, Iowa, Georgia, Indiana, Michigan, Minnesota, Wisconsin, Ohio, and New Jersey. The Ohio law, which was passed in 1896, was repealed in 1902, leaving 10 States with such laws still in force. To break down the opposition to the coinurance clause, the companies have adopted a plan of offering insurance at a lower rate when the coinurance clause is in the policy than when it is not. This they can afford to do, since the effect of the clause is to reduce the risk. Several States which prohibit coinurance clauses under other circumstances authorize them when they are accompanied by a reduction of rates.

Governmental Regulations. The discussion of the advisability of government ownership and management of the insurance business belongs in the general article on INSURANCE. So far as fire insurance is concerned, there have been but few experiments in that direction. Such government fire-insurance offices as have been established, chiefly in Prussia and Switzerland, have operated over so small a territory that their experience is of little value. They have lacked one of the chief supports of an insurance office—the increased regularity in the proportion of losses to risks which results from bringing many risks together in one company. In all parts of the civilized world governmental supervision and regulation of private companies is the general rule in the insurance business. In the United States each individual State exercises supreme authority over the business within its own territory, as the national government has as yet made no attempt to regulate it. The result is a great deal of diversity in the laws to which companies operating in a large number of States are subjected. Nearly all these laws have been passed in the real or supposed interests of the insured. A few relating to taxation have been passed for the purpose of raising revenue. Reference has already been made to certain special laws in force in a comparatively small number of States, viz., anticom pact laws, valued-policy laws, and anticoinsurance laws. It remains to notice a few of the more common provisions of the different States. In nearly all States it is necessary for a company desiring to do business within its borders to secure a license from the proper State official. In some States it is necessary for a company from without the State to make a deposit for the security of policy holders within the State. It is sometimes necessary for agents to secure licenses to solicit business within the State. In nearly all States companies are required to make annual reports and to submit to examination by the proper State official whenever he deems it necessary. In most States they are required to maintain a reserve sufficient to reinsure all outstanding risks. All States tax fire-insurance companies (certain

mutual companies are exempted in some States), and sometimes a discrimination in taxation is made in favor of domestic companies against those from outside the State. In many States a "reciprocal" law is in force with regard to taxation and the conditions of entering the State—i.e., the law of the State provides that a company from any other State, desiring to enter its borders, must meet the same requirements as the State in which the company is chartered imposes upon other State companies. The great diversity of the regulations adopted by the different States points conclusively to the desirability of national control of the insurance business through congressional legislation.

FIRE ISLAND BEACH, or GREAT SOUTH BEACH. A low spit of land, about 30 miles long, and from $\frac{1}{4}$ to $\frac{1}{2}$ of a mile broad, which, with the shorter Oak Island Beach, to the west, incloses Great South Bay, on the southern coast of Long Island, N. Y. (Map: New York, G 5). Near its west extremity is a lighthouse of the first order, which has a flashing white light, 167 feet above mean high water and visible for 19 (nautical) miles; also a station from which transatlantic steamers bound for New York are first sighted. The beach is a popular summer resort. Margaret Fuller Ossoli, with her husband and child, perished by shipwreck on Fire Island in 1850.

FIRELESS COOKER. A device by means of which foods which have been thoroughly heated or partially cooked on the stove are kept hot a sufficiently long time to complete the cooking process. This is accomplished by providing a suitable covering of insulating material into which the cooking pot with its hot contents can be placed. Many types of fireless cooker are on the market, which, though like in principle, differ in the details of construction, the sort of insulating material used, and in similar ways. The common insulating materials are mineral wool and asbestos.

Fireless cookers which will give satisfactory results can be easily made at home, by using a box or chest of such size that the cooking pot can be surrounded with a layer about 6 inches thick of nonconducting material, such as hay, excelsior, or crumpled paper. A cushion of suitable size is placed over the top of the cooking pot, which should have straight sides and a tight-fitting cover, and the box closed with a tight-fitting lid. In such fireless cookers there is no source of heat excepting that derived from the preliminary cooking on the stove and retained in the hot material in the cooking pail.

Some of the commercial cookers have an extra source of heat, i.e., soapstone or iron plates which can be heated on the stove during the preliminary cooking and placed in the cooker under or over the cooking pot or both. This pre-

supposes an insulating material and construction which cannot be set on fire by the hot plates.

Advantages claimed for the fireless cooker are economy of fuel, convenience, and economy of time. For instance, a housewife while getting breakfast can start the cookery of many of the dishes (meats, vegetables, etc.) needed for dinner or supper, place them hot in the fireless cooker, close it, and leave them without further attention. At dinner or supper time the foods can be warmed again if they have cooled below a temperature at which it is desired to serve them. See **COOKERY**.

Huntington, "Fireless Cooker," *University of Wisconsin, Bulletin 217* (Madison, 1908); *Cornell Reading Course for Farmers' Wives*, No. 23 (Ithaca, 1907); Davis and Wood, "Illustrated Lecture on the Homemade Fireless Cooker," *United States Department of Agriculture, Syllabus 15* (Washington, 1914).

FIRELESS ENGINE. A form of steam or vapor engine which is detached from the heating apparatus, and which carries no fuel in process of combustion to generate heat. Dr. Emile Lamm, of New Orleans, invented, July 19, 1870, an engine in which the motive power was derived from the vapor of ammonia. The ammonia, as it escaped from the engine, was passed into a reservoir of water, in which it was absorbed; the water when heated to a temperature of about 135° F. gave up the ammonia as gas, which was returned to the engine to be used over again, and then again absorbed and returned as before. This engine was found efficient and economical for the movement of street cars. The use of ammonia was soon abandoned, steam taking its place. Water heated to 212° F. becomes vapor if the pressure upon it be no more than the usual atmospheric 15 pounds per square inch. If the pressure be greater, the water remains liquid until a higher temperature is reached, the temperature varying with the pressure according to well-known laws. If steam at a high pressure be admitted to water of low temperature and pressure in a closed vessel, the steam will be condensed in the water, but the pressure in the vessel will be increased, while the volume of the water will be enlarged by the volume of that derived from the condensed steam. The water thus becomes charged with steam condensed under high pressure, and when the pressure is relieved, a portion of the steam reverts to its condition of vapor and may be conducted in the usual way to a cylinder and piston, where it will do its customary work. The opening of the valves gives vent to the vapor, gradually reduces the pressure, and relieves the condensed steam; so that a tank, filled with water and stored with many times its volume of uncondensed steam, will furnish motive power sufficient to move the engine and a considerable train of cars for a trip of several miles. On its return the tank is connected with a stationary boiler from which it receives a fresh supply of steam. It will not be forgotten that the real force of the steam is due to the heat which it contains, and that if the heat be lost, by radiation or otherwise, from the tank containing the condensed steam, its potential energy is so much reduced. In the engine used at New Orleans the mechanism was that of an ordinary locomotive minus its fire box, having a water tank instead of a boiler; the

appliances for stopping, starting, and backing were as usual. The tank was about 6 feet long and 3 feet in diameter, covered thickly with felt and wood to retain its heat. Steam was taken until the gauge indicated 135 to 150 pounds, the temperature for 135 pounds being 353°. With this accumulation of power the machine ran 5 to 7 miles before the pressure was reduced to 60 pounds. The labor and care of firing are avoided on one of these engines, and they offer no danger from sparks from a chimney stack or hot ashes and coal from an ash pit of a furnace. They have been made unnecessary by the coming in of the compressed-air locomotive and the various systems of electric traction. They were never economical.

FIRELOCK. A firearm introduced about 1690, the charge of which was ignited by the concussion of flint and steel. The *matchlock* previously in use required a lighted match at the powder pan. See **SMALL ARMS**.

FIRENZE. See **FLORENCE**.

FIRENZE, ANDREA DA. See **CICCIONE**.

FIRENZUOLA, fě'rēn-zwō'la, AGNOLO, or ANGIOLO, GIOVANNINI (1493-c.1546). An Italian writer, remembered chiefly for the idiomatic elegance of his language and for his spirited translation of *The Golden Ass* of Apuleius. He was born at Florence, studied law at Siena and Perugia, and in spite of a gay life, to which he was ever faithful, he finally joined the Brotherhood of Vallombrosa. He rose to considerable influence in Rome, where he had gone to practice law, and Clement VII, who freed him from his monastic vows, assured him sufficient income to admit his exclusive devotion to literature in Florence. Firenzuola's works include two comedies, a dialogue, *Delle bellezze delle donne*, a eulogy upon the charms of women; *Discorsi degli animali*, the basis of which was probably a Spanish descendant of the Sanskrit book of fables known as the *Panātāntara* (q.v.); and the *Ragionamenti*, a collection of novelle written in imitation of the *Decameron*. For biography, consult: Bianchi's edition of Firenzuola's works (Florence, 1848); that of Guerrini, *Novelle di Firenzuola* (ib., 1886); M. Rosai, *L'Asino d'oro di Agnolo Firenzuola* (Città di Castello, 1901).

FIRE OPAL. See **OPAL**.

FIREPLACE. See **HEATING AND VENTILATION**.

FIREPROOF BUILDING. See **FIREPROOF CONSTRUCTION**.

FIREPROOF CONSTRUCTION. Fireproof buildings have been defined as those constructed with walls of brick, stone, terra cotta, concrete, iron, or steel, in which wood beams or lintels are not placed, and in which the floors and roofs are constructed as below outlined. According to the most approved codes the stairs and staircase landings must be built entirely of brick, stone, Portland cement, concrete, iron, or steel. No woodwork or other inflammable material shall be used in any of the partitions, furrings, or ceilings in any fireproof buildings, excepting, however, that when the height of the building does not exceed 12 stories, or more than 150 feet, the doors and windows and their frames, the trims, the casings, the interior finish when filled solid at the back with fireproof material, and the floor boards and sleepers directly thereunder may be of wood, but the space between the sleepers shall be solidly filled with fireproof materials and extend up to the underside of the floor boards. When the

height of a fireproof building exceeds 12 stories, or is more than 150 feet, the floor surfaces shall be of stone, cement, rock, asphalt, tiling, or similar incombustible material, or the sleepers and floors may be of wood treated by some approved process to render the same fireproof. All outside window frames and sash shall be of metal or of wood covered with metal. The inside window frames and sash, doors, trim, and other interior finish may be of wood covered with metal, or of wood treated by some approved process to render the same fireproof. All hall partitions or permanent partitions between rooms in fireproof buildings shall be built of fireproof material and shall not be started on wooden sills or on wooden floor boards, but be built on the fireproof construction of the floor and extend to the fireproof beam filling above. The tops of all doors and window openings in such partitions shall be at least 12 inches below the ceiling line.

Fireproof floors shall be constructed with steel floor beams so arranged as to spacing and length of beams that the load to be supported by them, together with the weights of the materials used in the construction of the said floors, shall not cause a greater deflection of the said beams than $\frac{1}{16}$ of an inch per foot of span under the total load, and they shall be tied together at intervals of not more than eight times the depth of the beam. Between the beams shall be placed brick arches springing from the lower flange; or hollow tile arches of hard-burnt clay or porous terra cotta of uniform density and hardness of burn; or arches of Portland cement concrete, segmental in form, which shall have a rise of not less than $1\frac{1}{4}$ inches for each foot of span between the beams; or between the said beams may be placed solid or hollow burnt-clay, stone, brick, or concrete slabs in flat or curved shapes, concrete, or other fireproof composition, and any of said materials may be used in combination with wire cloth, expanded metal, wire strands, or wrought-iron or steel bars; but in any such construction, and as a precedent condition to the same being used, tests shall be made.

No filling of any kind which may be injured by frost shall be placed between the floor beams during freezing weather; and if the filling is so placed during any winter month, it shall be temporarily covered with suitable material for protection from being frozen. On top of any arch, lintel, or other device which does not extend to and from a horizontal line with the top of the floor beams, cinder concrete or other suitable fireproof material shall be placed to fill up solidly the space to a level with the top of the floor beams and shall be carried to the underside of the wood floor boards in case such be used. All fireproof floor systems shall be of sufficient strength to safely carry the load to be imposed thereon without straining the material in any case beyond its safe working strength. The bottom flanges of all floor beams and flat roof beams, and all exposed portions of such beams below the abutments of the floor arches, shall be entirely incased with hard-burnt clay, porous terra cotta, or other fireproof material allowed to be used for the filling between the beams, to which such incasing material shall be properly secured. The exposed sides and bottom plates or flanges of girders supporting floor beams, or supporting floor arches or floors, shall be entirely incased in the same manner. After the floors are constructed no opening greater than 8 inches square

shall be cut through said floors unless properly boxed or framed around with iron. And such openings shall be filled in with fireproof material

ing, or used to support any fireproof floor, shall be protected with not less than two inches of fireproof material, securely applied. The ex-

FIG. 1. FLAT FLOOR ARCH (SIDE-METHOD CONSTRUCTION).

FIG. 2. FLAT FLOOR ARCH (END-METHOD CONSTRUCTION).

after the pipes or conduits are in place. All columns, including the lugs and brackets on same, used in the interior of any fireproof build-

ing, or used to support any fireproof floor, shall be protected with not less than two inches of fireproof material, securely applied. The ex-

Materials. The systematic study of fireproof or fire-resisting construction used in such building as above described is a development of comparatively recent years. Various materials have

terra-cotta floors and roofs, built in the form of vaults sprung from brick piers, so that no metal work would be needed for structural purposes. Such a building, if properly designed

FIG. 3. FLAT FLOOR ARCH (COMBINATION-METHOD CONSTRUCTION).

been employed from time to time for the purpose of making buildings fireproof. Cast and wrought iron, steel, stone, terra cotta, plaster, mortar, and concrete are the materials in most general

and built, would withstand the combined action of all of the elements for centuries, but it would naturally require thick walls and heavy piers. Practical considerations, however, call for the

FIG. 4. SEGMENTAL ARCH.

use. Experience has shown, however, that the only practicable way to build a really fireproof building is to use nothing but incombustible materials for its structural parts, and to protect

utmost economy in space, and for this reason columns and other vertical supports must be as small and as far apart as possible, and floors must be thin and have level ceilings; these can

FIG. 5. GIRDER PROTECTION.

any of those materials which are injuriously affected by heat, such as iron and steel, by some fire, water, and heat-resisting material. An ideal fireproof building would be one constructed entirely of bricks and terra cotta, with brick or

be obtained only by using metal for the structural parts, protecting it from direct exposure to fire or heat by some fire-resisting material. While design and construction are important elements in making a building fireproof, yet, so far

as the structure of a modern steel-frame fireproof building is concerned, it may be desirable to consider it apart from the present article and under the head of STEEL SKELETON CONSTRUCTION (q.v.), in which the engineering and other structural problems involved in the design of a modern skyscraper or other city building are discussed, leaving for the present article the form and the method of the protection which

FIG. 6. ROOF CONSTRUCTION.

must be applied to the main structure. Of all fire-resisting materials probably burnt clay has the widest application in fireproof building, for it is an excellent nonconductor, and having once passed through the ordeal of fire it is practically indestructible. For the construction of floors and partitions and for the protection of columns and girders, the clay is molded into hollow blocks or tiles of suitable shapes.

Three kinds of terra cotta are used for making blocks—porous, semiporous or semiglazed, and dense or glazed. Each has its own particular field of usefulness.

Porous terra cotta is made by mixing about one-third, in bulk, of finely cut straw or sawdust with fine clay, which, after being tempered and molded, is burnt under a high heat, causing

the combustion of the straw or sawdust and leaving the material in a porous state like pumice stone. It will not crack or break from unequal heating or sudden cooling, it can be cut easily and is soft enough to allow the driving in of nails or screws for securing the interior trim, and it is elastic, tough, and light and non-heat-conducting in itself, so that it can be made in solid as well as in hollow blocks. Because of these properties it is generally used for interior partitions, for column and girder protection, and for furrings generally; but it is not used in the construction of outside walls or where excessive dampness occurs because it is absorbent, nor is it suitable for floor construction on account of its lack of strength.

In the manufacture of semiporous or semiglazed terra cotta, a smaller percentage of sawdust is used, or finely screened boiler cinders are substituted instead. The result is a material slightly more porous than the best grade of brick, but still not so soft as the ordinary porous terra cotta. Semiporous terra cotta is used largely for floor construction, for column and girder protection, and for the building of outside walls.

Dense or glazed terra cotta is made generally of some natural fire clay without the addition of any combustible material. The only ingredients added are low grades of clay, crushed bricks, or terra cotta, or sand, to prevent excessive shrinkage. Dense terra cotta cannot be cut without breaking; it is brittle and liable to failure under sudden shocks. In places where suddenly applied loads are expected, porous material should be used, but under static loads dense terra cotta is better than porous, being stronger; and because it is also cheaper it is very generally used for floor construction. On account of its nonabsorbent qualities it is largely employed for building exterior walls, the blocks being grooved or scored to provide a key for the stucco, as there is not sufficient suction to hold the stucco on the smooth glazed surface. Dense tiles, because of their brittle nature, require wooden grounds and nailing strips, which detract from their fireproof qualities, so they are not used for interior partitions, furrings, or column protections.

Floor Arches. Hollow tile floors may be built of flat arches (Fig. 1) or of segmental arches (Fig. 4). Flat hollow tile arches are made of two "skews," or "skewbacks," resting against the web of the beams and sitting around the lower flanges, one "key," or "centre block," and "fillers," "part fillers," or "intermediates," as they are variously designated, sufficient in number to fill the spaces between the skewbacks and the key. A safe rule for finding the proper depth of the arch in inches is to multiply the span in feet by $1\frac{1}{4}$ inches and add the thickness of the protection below the beams. The blocks are divided into hollow spaces by interior webs or partitions from 3 to 4 inches apart, the number depending upon the size of the block. The lower flanges of the beams carrying the floors should be covered with at least $1\frac{1}{2}$ inches of fireproofing. To accomplish this, the skews are made either with a bevel on the bottom to receive a protection tile for the beam (as shown at X, Fig. 3), or with the protection burnt upon the skew itself (as shown at Y). The former is more generally used because it is easier to make. In manufacturing the skew with the beam protection burnt on the block, it is difficult

to keep the flanges straight; during drying and burning they frequently become so warped as to break off when placed on the beam, and in addition the projection is liable to be broken off in careless handling.

There are three general types of flat arched floors used in modern fireproof buildings. The first and oldest is known as the "side-method construction," in which the tiles are set side by side between the beams (as shown in Fig. 1). In the second type, known as the "end-method construction," the blocks run at right angles to the beams abutting end to end (as shown in Fig. 2). The third type is a combination of the first and second, the skewback and the key being made as in the side method, and the fillers abutting end to end between them, as in the end

limited to the buildings above mentioned. Segmental arches are always made after the side-method construction.

Girder Protection. Girders projecting below the ceiling line are especially exposed to the effects of fire and water as intense heat is brought to bear on the corners of the protection and the streams from the fire hose tend to tear it off, so that they should be provided with not less than 2 inches of terra cotta. In general it may be said that the protection in which stability depends upon the use of metal clamps or anchors (as shown in X, Fig. 5) is not so efficient as that in which the soffit protection holds its position independently of them (as in Y).

Roof Arches. Nearly all fireproof buildings have flat roofs, pitched just enough to cause

FIG. 7. WALL CONSTRUCTION.

method (as shown in Fig. 3). So far as absolute strength is concerned, the end method is about 50 per cent stronger than the side method. The objections to the end-method arch are, it is wasteful of mortar and it is difficult to bed properly the edges of the blocks. Also, as there is no bond between the rows of blocks, if a single block in a row becomes broken or is knocked out of place, the entire row may fall, and for the same reason a single block cannot be omitted for making a temporary hole as may be done in the side-method arch. Notwithstanding these objections the end-method arch, being just as cheap and much stronger for the same weight, has largely superseded the side-method arch.

Where a flat ceiling is not essential, and for warehouses, factories, and buildings of a similar character, the segmental arch (shown in Fig. 4) makes the strongest, cheapest, and best fireproof floor that can be built of hollow terra cotta; but on account of the arched ceiling resulting from its employment, its use has generally been

water to run to the lowest point, as it is easier to make a flat roof thoroughly fireproof than a pitched roof. The usual and also the best method of constructing flat roofs is to lay the beams with the required pitch and then build the roof in the same way as the floor. Where the ceiling is suspended (as shown in Fig. 6), segmental arches may be used. Pitched roofs are generally covered with 2 or 3 inch porous terra-cotta tiles (shown at X in Fig. 6), called book tiles, because the joints resemble the backs and edges of a book. They are set on the flanges of light T-irons spaced the proper distance on centres.

Walls and Partitions. Since about 1908 hollow tile blocks have been largely used for building the outside walls of dwellings and of other buildings of moderate height. The wall blocks are made of semiporous or dense material, 8, 10, and 12 inches thick and 12 inches high, and are scored on all sides to provide a key for the plaster (as shown in Fig. 7). They are always

set with the voids or cells running vertically and with the joints broken in each course. Special blocks are made for corners and also for sills, joints, and lintels. A special form of floor construction used in connection with these walls is also shown in Fig. 7. Interior partitions are built of brick-shaped hollow blocks (as shown in Y, Fig. 6), a 4-inch thick block being used in most cases.

Column Covering. The most common form of column protection consists of a layer of 2 or

FIG. 8. COLUMN PROTECTION.

3 inch hollow partition blocks (shown in Fig. 8), laid against a solid backing of concrete or tiles, where the blocks do not bear against the column. Consideration of appearance, or the amount of floor space to be occupied, is frequently allowed to influence unduly the shape or size of the fireproofing material for columns to the detriment of the protection and often leads to the use of very thin solid slabs, which should not be permitted. The Chicago Building Ordinance is very explicit in its requirements for the protection of columns and is a good guide to follow in all

FIG. 9. COLUMN PROTECTION.

cases. It is: "The covering of columns shall be of brick not less than 8 inches thick, or of two consecutive layers of hollow tiles [Fig. 9], not less than 2½ inches thick, or of two layers of porous terra cotta not less than 2 inches thick each. Whether hollow tile or po-

rous terra cotta is used, the two consecutive layers shall be so applied that neither the vertical nor the horizontal joints in the same shall be opposite each other, and each course shall be so bonded and anchored within itself as to form an independent and stable structure. In places where there is trucking, or wheeling, or other handling of packages, the lower 5 feet of the fireproofing shall be incased in a protective covering of sheet iron 1 inch away from it, with the space filled in with mortar [X, Fig. 8], or of oak slats [Y], or of angle irons set at the corners and tied together with iron bands."

Other Fireproof Materials. Next to terra cotta, concrete and plaster are the most commonly used materials for fireproofing. Concrete floor arches are shown in Figs. 10 and 11. For

FIG. 10. REINFORCED CONCRETE ARCH.

further description of these systems, see section on *Reinforced Concrete* in article CONCRETE. Partitions are frequently built of reinforced concrete, and so are column coverings. Reinforced concrete is naturally a fire-resisting material, and reinforced-concrete structures are essen-

FIG. 11. EXPANDED METAL CONCRETE ARCH.

tially fireproof and safe if their construction is attended with proper precautions, and especially if proper materials are selected for the concrete itself, so that it can resist the high temperatures which may be experienced. To secure the best results with reinforced concrete from the standpoint of fire protection, it is, of course, necessary to make sure that the areas of the concrete floor arches are restricted, the bearing columns and reinforcement are adequate, and the design is such as to provide against failure in case any individual portion of the structure becomes unduly heated. Plaster, in the form of blocks, is also used for building interior partitions. For further description, see article on PLASTER; also that on FIRE PROTECTION, MUNICIPAL.

Bibliography. Consult volumes of the various engineering papers for the last 10 years. Among the books which may be consulted are: Freitag, *Fire Prevention and Protection* (New York, 1912); Birkmire, *The Planning and Construction of High Office Buildings* (ib., 1898); Kidder, *Building Construction*, part i, "Masons' Work" (ib., 1896); Fuller, *Fireproof Building Construction* (ib., 1904); Moore, *Fire Insurance and How to Build* (ib., 1903); Kidder, *Building Construction and Superintendence* (9th ed., ib., 1913); id., *Architects' and Builders' Pocket Book* (ib., 1914). See ARCHITECTURE; CONCRETE; FOUNDATION; FIRE PROTECTION, MUNICIPAL; STEEL SKELETON CONSTRUCTION.

FIREPROOFING. The coating or impregnation of combustible materials, such as textile fabrics and wood, with chemical preparations so as to prevent their burning either partially or entirely. Such substances for the most part act

by coating the material with a crust of mineral matter on the surface of the fibres that serves to prevent the combustion, but does not interfere with decomposition. Cotton and linen may be steeped in certain saline solutions such as alum, ammonium chloride, ammonium phosphate, borax, zinc sulphate, and sodium tungstate, in order to render them unflammable. Preparations of these salts in various combinations and proportions find extensive use in the treatment of canvas used for scenery in theatres, and in many places it is required by law that the drop curtain at least shall be fireproof. Papers that are both fireproof and waterproof may be made from a pulp consisting of vegetable fibre to which asbestos and salts, such as alum and borax, in suitable proportions, have been added. The Perkin Non-Flam Process, an English process of fireproofing cotton fabrics, consists in impregnating the material with a solution of sodium stannate of 1.22 sp. gr., drying thoroughly, and further treating with an ammonium sulphate solution of about 1.75 sp. gr. Stannic oxide is precipitated in the fabric. Sodium sulphate is also formed, and is removed by washing. The material is then ready for drying and finishing. It is claimed that the fireproofing is so permanent that the fabric can be washed repeatedly.

For the impregnating of timber to make it fire-resistant and unflammable, numerous processes have been proposed. As deliquescent salts cannot be used, and certain compounds like sodium silicate cannot be made to penetrate the wood satisfactorily, treatment of the timber in practice has been limited to ammonium salts such as sulphate and phosphate, and aluminium and ferric sulphates.

Fairly good fire-resistant results are at times obtained by means of so-called fireproof paints. These include paints in which sodium silicate and zinc chloride have been incorporated. Dense coatings of whitewash have considerable fire-resistant value and with the addition of silicate of soda are often used. See FIREPROOF CONSTRUCTION.

FIREPROOF SAFES. See SAFES AND SAFE DEPOSIT VAULTS.

FIRE PROTECTION, MUNICIPAL. The protection of a community against sudden outbreaks of fire and the restriction of such fires to the narrowest possible limits is a function that usually by common consent is assumed by the local government, though it may be supplanted by private organizations where such are especially required. To deal with the emergencies involved in an outbreak of fire sudden and rapid efforts are required, and there is involved a certain amount of organization and equipment, as well as disciplined men. Such discipline must be practically military, since where a fire department is called to act there must be no confusion or hesitation, as no other work requires greater promptness, both in reaching the scene of action and in taking the necessary measures to check the outbreak.

In most municipalities the fire-protection service—or fire department, as it is usually termed—includes the fire alarm and telegraph, the fire engines and other apparatus, and men organized and trained to a degree rarely, if ever, found in other departments of municipal service. The water works, which naturally are an integral feature of any scheme of fire protection, more usually are under separate organization. (See

WATER WORKS.) In European cities the fire department may be directly under military organization, or it may be composed of soldiers and sailors who have seen military service and are under the control of retired officers, thus maintaining all the characteristics of an active military organization.

In the United States the fire departments are exclusively civil and local and are marked by varying degrees of efficiency and discipline, but in practically all there are traditions of loyalty and personal heroism which not only act for the good of the department and general effectiveness, but render it the pride of the citizens of the municipality. In fact such service is considered highly honorable and carries with it the same immunities as militia duty.

The problem in an American or Canadian city is quite different from that in Europe, where the buildings are usually of stone and where building regulation, both for sound construction and maintenance, has been in force for many years. In the United States and Canada, where the growth of cities has been rapid and wood has been the usual material on account of its cheapness and availability, large cities of inflammable character have grown up, and various practices, due to carelessness and lack of foresight, have prevailed which entail an enormous annual fire loss.

While the true function of a fire department is to prevent fires and confine them to as narrow an area as possible, in America the fire department has been called upon to deal not only with occasional and sporadic outbreaks, but with large conflagrations, and the public at large has been apt to consider a fire department's efficiency as consisting in its ability to handle a large conflagration rather than its ability to restrict a fire to its point of origin and prevent fires by adequate inspection and suitable rules and regulations in coöperation with building and other departments. Vast sums annually are appropriated for fire protection, and in many cases they are not even commensurate with the hazards which exist in the various cities. Of recent years the problem of fire prevention has been brought before the general public by insurance authorities and municipal officials, so that its importance is realized as never previously, and efficient inspection and suitable regulations are no longer considered infringements of individual rights, but as necessary to the safety and welfare of the community. Accordingly the safety requirements of building departments are being increased, and often the intervals between fires are being utilized by having uniformed members of the fire department inspect various buildings with an idea to detecting violations of rules and regulations and improper conditions, as well as becoming acquainted with the character of the buildings in the districts where they serve.

While it cannot be said that satisfactory methods and organization for fire prevention universally have been adopted in the United States and Canada, yet there has been great improvement, and various laws and regulations in addition to the requirements of insurance companies are bringing about better conditions. In many States, as a result of recent legislation, there are State fire marshals, who supplement efforts of local officials when they are lax or when such supervision is absent altogether, and their powers vary in kind and degree. Methods of fire

prevention involve not only the protection of property, but the increased safety of life, especially in public buildings and institutions, and where throngs of people are congregated for purposes of business or amusement; thus, the detailing of firemen to theatres and other auditoriums and the supervision of fire drills are usual practices in large cities.
